Dissolution Comply with the dissolution test (Appendix X C, method 1), using 900 ml of water as dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 5 ml of the solution after exactly 45 minutes and filter. discard the initial filtrate measure accurately 2 ml of the successive filtrate in a 10 ml volumetric flask and dilute with water to volume, mix well. Measure accurately 2 ml of the solution, add 10 ml of bromocresol green solution [dissolve 0.2 g of bromocresol green in 30 ml of water and 6.5 ml of sodium hydroxide (0.1 mol/L) VS, add 19.0 g of sodium dihydrogen phosphate and 2.5 g of sodium hydrogen phosphate, dilute with water to produce 500 ml, mix well, adjust to pH 4.6 ± 0.1 with hydrochloric acid (0.1 mol/L) VS, mix well] and extract with exactly 20 ml of chloroform. Separate the clear chloroform layer and measure the absorbance at 420 nm (Appendix IV A). Measure accurately 2 ml of ethambutol hydrochloride CRS solution (each ml contains 50.0 μ g of ethambutol hydrochloride CRS), proceed as described above, beginning at the words "add 10 ml of bromocresol green solution...". Calculate the dissolution of $C_{10}H_{24}N_2O_2 \cdot 2HCl$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.1 g of ethambutol hydrochloride to a separator, add 10 ml of a 8% solution of sodium hydroxide and 2 g of sodium chloride. Extract with 5 quantities, each of 25 ml, of chloroform, shake for about 5 minutes, filter the chloroform extracts through a layer of anhydrous sodium sulfate in a funnel and wash the filter with 25 ml of chloroform. Evaporate the combined washings and extracts of chloroform at 70°C in a water bath and cool. Add 75 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.86 mg of $C_{10}H_{24}N_2O_2 \cdot 2HCl$.

Category As described under Ethambutol Hydrochloride.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Ethanol

C_2H_6O 46.07

[64-17-5]

Description A colourless and clear liquid; odour, slightly characteristic; taste, burning; readily volatile and inflammable, burns with a blue flame; boils at about 78°C. Miscible with water, glycerol, chloroform or ether.

Relative density Not more than 0.8129 (Appendix VI A) equivalent to not less than 95.0% (ml/ml) of C_2H_6O .

Identification To 1 ml add 5 ml of water and 1 ml of sodium hydroxide TS, add dropwise 2 ml of iodine TS slowly; an odour of iodoform is yielded and a yellow precipitate is formed.

Acidity To 10 ml add 25 ml of water and 2 drops of

phenolphthalein IS, mix well, add dropwise sodium hydroxide (0.02 mol/L) VS until the solution becomes slightly red; add 25 ml of the substance being examined, add 10 ml of water and 2 drops of phenolphthalein IS, mix well, and add 0.5 ml of sodium hydroxide (0.02 mol/L) VS; a slightly red colour is produced.

Water insoluble substances Mix with an equal volume of water, the solution is clear, allow to stand at 10°C for 30 minutes, the solution maintains clear.

Fusel oil Mix 10 ml with 5 ml of water and 1 ml of 1-cerol, drop on a piece of filter paper slowly and allow the ethanol to evaporate at room temperature; no abnormal odour is perceptible.

Methanol Dilute 5.0 ml with water to produce 100 ml and mix well. To 1.0 ml of the solution add 0.2 ml of phosphoric acid solution (1 → 10) and 0.25 ml of 5% potassium permanganate solution. Allow it to stand at 30–35°C for 15 minutes, add 10% sodium metabisulfite solution until the solution becomes colourless, add slowly 5 ml of precooled sulfuric acid solution (3 → 4) with cooling in an ice bath. Add 0.1 ml of freshly prepared 1% chromotropic acid solution and heat in a water bath for 20 minutes. Any colour produced is not more intense than that of a reference solution prepared in the same manner, using 1.0 ml of methanol standard solution (to 20 mg, accurately weighed, of methanol add water to produce 200 ml) (0.20%).

Readily oxidizable substances Transfer 20 ml to a 50 ml stoppered cylinder washed successively with hydrochloric acid, water and the substance being examined. Cool to 15°C, add 0.10 ml of potassium permanganate (0.02 mol/L) VS, stopper and mix well. Allow it to stand at 15°C for 10 minutes; the pink colour does not disappear completely.

Acetone and isopropanol To 1.0 ml of alcohol add 1.0 ml of water, 1.0 ml of saturated disodium hydrogen phosphate solution and 3.0 ml of saturated potassium permanganate solution, mix well and allow to stand in a water bath at 45–50°C until the colour of potassium permanganate disappears. Add 3.0 ml 10% sodium hydroxide solution, mix well, filter with a sintered glass filter. Add 1.0 ml of freshly prepared 1% furfural solution to the filtrate and allow to stand for 10 minutes. Add 3.0 ml of hydrochloric acid to 1.0 ml of the solution and examine within 3 minutes. Any pink colour produced is not more intense than that of a reference preparation (Mix 1.0 ml of saturated disodium hydrogen phosphate solution with 3.0 ml of 10% sodium hydroxide solution, 0.8 ml of 0.001% acetone solution and 1.0 ml of 1% furfural solution, dilute with water to produce 10 ml, and allow to stand for 10 minutes. To 1.0 ml of the resulting solution add 3.0 ml of hydrochloric acid) (0.0008%).

Pentanol or non-volatile readily carbonizable substances Evaporate 25 ml on a water bath to about 0.05 ml, add a few drops of 95% sulfuric acid; no red or brown colour is produced.

Non-volatile matter Transfer 40 ml to an evaporating dish previously dried to constant weight at 105°C, evaporate on a water bath to dryness, dry at 105°C for 2 hours; the residue is not more than 1 mg.

Category Solvent and antiseptic-disinfectant agent.

Storage Preserve in tightly closed containers, protected from light.

Ethinylestradiol

$C_{20}H_{24}O_2$ 296.41

[57-63-6]

Ethinylestradiol is 19-nor-17 α -pregna-1,3,5 (10)-trien-20-yne-3,17-diol. It contains not less than 97.0% and not more than 103.0% of $C_{20}H_{24}O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Freely soluble in ethanol, propanol or ether; soluble in chloroform; insoluble in water.

Melting range 180–186°C (Appendix VI C).

Specific optical rotation -26° to -31° , in a solution of 10 mg per ml in pyridine (Appendix VI E).

Identification (1) Dissolve 2 mg in 2 ml of sulfuric acid, the solution is coloured orange red with a yellowish-green fluorescence; pour the solution into 4 ml of water, a rose red flocculent precipitate is produced.

(2) Dissolve 10 mg in 1 ml of ethanol, add 5–6 drops of silver nitrate TS, a white precipitate is produced.

(3) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ethinylestradiol (Appendix XVI).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in absolute ethanol to produce a solution (1) of about 8 mg per ml. Measure accurately 2 ml of solution (1) into a 100 ml volumetric flask and dilute with absolute ethanol to the volume, shake well as solution (2). Inject 10 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about full scale of the chart. Then inject separately 10 μ l of solutions (1) and (2) into the column and record the chromatogram for twice of the retention time of the principal peak. Not more than 4 peaks other than the principal peak in the chromatogram obtained with solution (1), each peak area is not greater than 1/2 of area of the principal peak of solution (2), the sum of the areas of all peaks other than the principal peak is not greater than 3/4 of area of the principal peak area of solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 281 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of ethinylestradiol. The resolution factor between the peaks of ethinylestradiol and internal standard solution complies with the related requirements.

Internal standard solution Dissolve about 20 mg of

megestrol acetate, accurately weighed, in dehydrated ethanol in a 10 ml volumetric flask and dilute to volume, mix well.

Procedure Dissolve about 40 mg of ethinylestradiol CRS, accurately weighed, in dehydrated ethanol in a 5 ml volumetric flask and dilute to volume, mix well as the reference solution. Transfer 2 ml each of the reference solution and internal standard solution, both accurately measured, into a 10 ml volumetric flask, dilute with methanol to volume, mix well, inject 10 μ l of the resulting solution into the column. Repeat the operation using a quantity of the substance being examined instead of ethinylestradiol CRS, calculate the content of $C_{20}H_{24}O_2$.

Category Estrogen.

Storage Preserve in tightly closed container, protected from light.

Preparation Ethinylestradiol Tablets

Ethinylestradiol Tablets

Ethinylestradiol Tablets contain not less than 80.0% and not more than 120.0% of the labelled amount of ethinylestradiol ($C_{20}H_{24}O_2$).

Description Sugar coated tablets with white or almost white core.

Identification (1) Triturate tablets equivalent to about 20 μ g of ethinylestradiol and triturate with 5 ml of dehydrated ethanol for a few minutes, filter, evaporate the filtrate to dryness in a water bath, add 1 ml of sulfuric acid dropwise; an orange red colour is produced.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Content uniformity Comply with the requirements for content uniformity (Appendix X E) except the limit is $\pm 20\%$. Take 1 tablet into a cube with plug (for strength 5 μ g, 20 μ g and 50 μ g) or a 100 ml volumetric flask (for strength 500 μ g) with 1 ml (for strength 5 μ g), 4 ml (for strength 20 μ g), 10 ml (for strength 50 μ g) or a quantity (for strength 500 μ g) of mobile phase, after 30 minutes of ultrasonic processing to make ethinylestradiol dissolve, then cool to room temperature, dilute to the volume with mobile phase, mix well and centrifugate, take the supernate as the test solution. Carry out the method described under the Assay, calculate the content of $C_{22}H_{29}FO_5$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detective wavelength is 220 nm. The number of theoretical plates of the column, calculated with reference the peak of ethinylestradiol, is not less than 4000 and The resolution factor between the peaks of ethinylestradiol and adjacent peaks should comply with the requirement.

Procedure Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 50 μ g of ethinylestradiol in a cube with plug, add 10 ml of mobile phase, sonicate for 30 minutes until ethinylestradiol is dissolved. Shake well and centrifugate, take the supernate as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of ethinylestradiol CRS, accurately weighed, in mobile phase and dilute with

mobile phase to produce a solution of about 5 μ g per ml, repeat the operations of the test solution, calculate the content of $C_{20}H_{24}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ethinylestradiol.

Strength (1) 5 μ g (2) 20 μ g (3) 50 μ g (4) 500 μ g

Storage Preserve in tightly closed containers, protected from light.

Ethisterone

$C_{21}H_{28}O_2$ 312.45

[434-03-7]

Ethisterone is 17-Ethynyl-17 α -hydroxyandrost-4-en-3-one. It contains not less than 97.0% and not more than 103.0% of $C_{21}H_{28}O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless.

Slightly soluble in pyridine, sparingly soluble in chloroform practically insoluble in water.

Specific optical rotation +28 to +33, in a solution of 10 mg per ml in pyridine (Appendix VI E).

Identification (1) To about 2 mg add 4 ml of dehydrated ethanol-sulfuric acid (1:1), heat in water bath to dissolve, a red solution is produced showing bright red fluorescence under ultra violet light (365 nm).

(2) To about 2 mg add 2 ml of ethanol, 1 ml of ethanolic solution of 1% 2,6-ditertial butyl benzoic acid and 2 ml of sodium hydroxide TS, heat in a water bath for 30 minutes, allow to cool, a deep blue colour is produced.

(3) To about 2 mg add 2 ml of ethanol in a clean test tube and then 1 ml of ammoniated silver nitrate TS, heat in a water bath, a silver mirror is formed on the inner surface of the tube.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ethisterone.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating material and chloroform-methanol (95:5) as mobile phase. Weigh accurately a quantity to prepare a solution of about 10 mg per ml of chloroform-methanol (3:1) as the test solution and a reference solution of 50 μ g per ml. Apply 10 μ l each of the two solutions to the same plate separately. After developing and removal of the plate, dry in air, spray with sulfuric acid-ethanol (2:8), heat for 5 minutes at 120°C, observe under ultra violet light (365 nm). The intensity of the fluorescence of any secondary spots of the test solution in the chromatogram is not more intense than that of the principal spot of the reference solution.

Loss on drying When dried for 4 hours at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for spectrophotometry (Appendix IV A), using a solution of about 10 mg per ml of dehydrated ethanol. Measure the absorbance at 240 nm, calculate the content of $C_{21}H_{28}O_2$, taking the value of A

(1%, 1 cm) as 520.

Category Progesteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Ethisterone Tablets

Ethisterone Tablets

Ethisterone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Ethisterone ($C_{21}H_{28}O_2$).

Description White tablets.

Identification (1) Dissolve about 10 mg of the extract obtained in Assay in 1 ml of ethanol, add 5-6 drops of silver nitrate TS, a white precipitate is formed.

(2) Dissolve a quantity of extract obtained in the Assay in dehydrate ethanol to prepare a solution of about 10 μ g per ml. Measure the absorbance of the solution (Appendix IV A), it exhibits a maximum at 240 nm with the value of A (1%, 1 cm) in the range of 0.50-0.54.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. Weigh accurately a quantity equivalent to about 50 mg of norethisterone in a separator, extract 4 times with petroleum ether. Discard the extract and remove all the petroleum ether in the separator. Extract again with 60 ml of chloroform in portions for 4 times. Transfer the extract to a tared conical flask, evaporate to remove chloroform to nearly dryness. Dry the residue at 105°C for 2 hours. Allow to cool, weigh and calculate the content of $C_{21}H_{28}O_2$.

Category As described under Ethisterone.

Strength (1) 5 mg (2) 10 mg (3) 25 mg

Storage Preserved in tightly closed containers, protected from light.

Ethosuximide

$C_7H_{11}NO_2$ 141.17

[77-67-8]

Ethosuximide is 2-ethyl-2-methylsuccinimide. It contains not less than 98.0% of $C_7H_{11}NO_2$, calculated on the anhydrous basis.

Description A white or pale yellow waxy solid; almost odourless; taste, slightly bitter; hygroscopic. Very soluble in ethanol or chloroform; freely soluble in water.

Melting range 43-47°C (use liquid paraffin as the heating liquid) (Appendix VI C).

Identification (1) To about 20 mg add 2 ml of sodium hydroxide TS, boil gently, the vapour produced turns moistened red litmus paper to blue.

(2) Heat 0.1 g with 0.2 g of resorcinol and 2 drops of sulfuric acid at about 140°C for 5 minutes, add 5 ml of water and make alkaline with 20% sodium hydroxide solution. Add a few drops of the solution into 5 ml of water; a yellowish-green fluorescence is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ethosuximide (Appendix XVI) (If necessary, treat the sample with dehydrated ethanol).

Acidity Dissolve 0.10 g in 10 ml of water, pH 3.0-4.5 (Appendix VI H).

Cyanide Comply with the limit test for cyanides, using 0.5 g (Appendix VIII F, method 1).

Water Carry out the determination of water, not more than 1.0% (Appendix VIII M, method 1A).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml of dimethylformamide, add 2 drops of azo violet IS, titrate with sodium methoxide (0.1 mol/L) VS in a current of nitrogen until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 14.12 mg of $C_7H_{11}NO_2$.

Category Anti-epileptic agent.

Storage Preserve in tightly closed containers.

Ethylmorphine Hydrochloride

$C_{19}H_{23}NO_3 \cdot HCl \cdot 2H_2O$ 385.89

[125-30-4]

Ethylmorphine Hydrochloride is 17-methyl-3-ethoxy-4, 5 α -epoxy-7, 8-didehydromorphinan-6 α -ol hydrochloride dihydrate. It contains not less than 98.5% of $C_{19}H_{23}NO_3 \cdot HCl$, calculated on the dried basis.

Description A white to pale yellow, crystalline powder; odourless.

Soluble in water or ethanol; slightly soluble in chloroform or ether.

Melting point 120-123°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 10 mg in 10 ml of sulfuric acid, add 1 drop of ferric chloride TS and heat on a water bath; a green colour is produced, turning gradually to deep purple-blue and subsequently to deep red on adding 1 drop of nitric acid.

(2) Dissolve about 20 mg in 1 ml of water, add 5 drops of ammonia TS and shake; a white turbidity is produced gradually (distinction from codeine).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ethylmorphine Hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 15 ml of water, add 1 drop of methyl red IS, the red colour produced becomes yellow on the addition of 0.30 ml of sodium hydroxide (0.02 mol/L) VS.

Clarity and colour of solution Dissolve 0.20 g in 10 ml of freshly boiled and cooled water any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of the reference solution Y₂ (Appendix IX A, method 1).

Ammonium Dissolve 0.25 g in 5 ml of water, add 5 ml of sodium hydroxide TS and heat in a water bath, the vapour evolved does not turn moistened red litmus paper to blue.

Morphine Dissolve 0.10 g in 5 ml of hydrochloric acid solution (9→1000), add 2 ml of sodium nitrite TS, mix well and allow to stand for 15 minutes, then add 3 ml of ammonia TS, mix well, any yellowish-brown colour produced is not more intense than that of a reference solution prepared in a similar manner using 5.0 ml of a morphine solution [dissolve 2.0 mg of anhydrous morphine in hydrochloric acid solution (9→1000) to produce 100 ml] (0.1%).

Loss on drying When dried at 50–60°C for 4 hours and then at 105°C to constant weight, loses not more than 10.0% of its weight (Appendix VIII L), use 0.5 g.

Residue on ignition Not more than 0.15% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid and 6 ml of mercury acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 34.99 mg of C₁₉H₂₃NO₃ · HCl.

Category Local stimulant (ophthalmic).

Storage Preserve in tightly closed containers.

Etifenin and Stannous Chloride for Injection

Etifenin and Stannous Chloride is a sterile, lyophilized mixture of Etifenin (C₁₆H₂₂N₂O₅) and Stannous chloride (SnCl₂ · 2H₂O). It contains not less than 85.0% and not more than 110.0% of the labelled amount of Etifenin.

Description A white lyophilized powder. Freely soluble in water.

Identification (1) Dissolve the contents of 1 container in water, add 1 drop of copper sulfate TS, shake well and add a few drops of sodium hydroxide TS; a brilliant green colour is produced.

(2) Apply 1 drop of the aqueous solution to a strip of ammonium phosphomolybdate TP; a blue colour is produced.

Clarity and colour of solution Dissolve the content of 1 container in 5 ml of Sodium Chloride Injection, the solution is clear and colourless.

Stannite Dissolve the contents of 5 containers in 3 ml of 1 mol/L hydrochloric acid solution saturated with nitrogen respectively. Carry out the method for potentiometric titration (Appendix VII A) under nitrogen current, titrate

with potassium iodate (0.01667 mol/L) VS. Not less than 0.07 ml of potassium iodate (0.01667 mol/L) VS is consumed for each container. If one of the containers fails to comply with the requirements, repeat the test on 5 additional containers and all of them should comply with the requirements.

Acidity The pH value of the solution obtained in the test for clarity and colour of solution is 3.8–4.8 (Appendix VI H).

Bacterial endotoxin Dissolve a quantity of the content in BET water (5 ml of BET water for each container), and dilute to more than 30 times of its original volume. Carry out the test for bacterial endotoxin (Appendix XI E); not more than 75 EU per ml.

Other requirements Complies the general requirements for injections (Appendix I B).

Assay Dissolve separately the contents of 3 containers in 2 ml of water, measured accurately, combine the solutions and mix well. Transfer 2 ml of the combined solution, measured accurately, to a 30 ml Kjeldahl flask, add 0.3 g of potassium sulfate and 5 drops of 30% copper sulfate solution. Add 2 ml of sulfuric acid along the wall of the flask and 6–10 drops of 30% hydrogen peroxide solution. Carry out the determination of nitrogen (Appendix VII D, method 2), and calculate the content of etifenin each container. Each mg of N is equivalent to 11.5 mg of C₁₆H₂₂N₂O₅.

Category Used for the preparation of Technetium [^{99m}Tc] Etifenin Injection.

Strength 40.0 mg of etifenin and 0.4 mg of stannous chloride (SnCl₂ · 2H₂O).

Storage Preserve in well closed containers, stored at 2–8°C in a dark place.

Etimicin Sulfate

(C₂₁H₄₃N₅O₇)₂ · 5H₂SO₄ 1445.58

Etimicin Sulfate is O-2-amino-2,3,4,6-tetradeoxy-6-amino-α-D-erythro-hexopyranosyl- (1→4)-O[3-deoxy-4C-methyl-3-(methylamino)-β-L-arabino-pyranosyl-(1→6)]-2-deoxy-N-ethyl-L-streptamine sulfate (2:5) (salt). It contains not less than 59.0 per cent of C₂₁H₄₃N₅O₇, calculated on the dried basis.

Description A white or almost white powder or friable mass; odourless; highly hygroscopic. Very soluble in water, practically insoluble in methanol, acetone, glacial acetic acid.

Specific optical rotation +100° to +115°, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve a quantity in water to produce a

solution containing 50 mg of the substance to be examined per ml as test solution. Dissolve a quantity of etimicin CRS in water to produce a solution of 50 mg per ml as reference solution. Dilute a quantity with test solution to produce a solution containing 2.0 mg of gentamycin C_{1a} per ml as mixture solution. Carry out the method for thin-layer chromatography described under Related substances. Apply each of above three solution. The principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution, and the spot of etimicin and gentamycin C_{1a} in the chromatogram obtained with the mixture solution is separated completely.

(2) The retention time of principal peak in the chromatogram obtained in the Assay with the test solution is identical with the principal peak in the chromatogram obtained with the reference solution.

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Either test (1) or (2) may be omitted.

Acidity Dissolve a quantity in water to produce a solution containing 50 mg per ml, pH 4.0-6.5 (Appendix VI H).

Clarity and colour of solution Dissolve each of 5 portions with water to produced 5 solutions containing 75 mg per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_2 or YG_2 (Appendix IX A, method 1).

Sulfate Dissolve about 0.12 g, accurately weighed, in 100 ml of water, adjust pH value to 11 with concentrated ammonia solution, add accurately 10 ml of barium chloride (0.1 mol/L) VS and 5 drops of phthalein purple IS. Titrate with disodium edetate (0.05 mol/L) VS, keep pH 11 during the period of titration. When the purple colour of the solution begins to discolour slightly, add 50 ml of ethanol and continue titration until the purple colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of sulfate (SO_4). The content of sulfate is not less than 31.5% and not more than 35.0%, calculated on the anhydrous basis.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G (a mixture of silica gel G and 0.5% sodium carboxymethyl cellulose 1:3 W/V) as the coating substance and a mixture of chloroform-methanol-concentrate ammonia solution (5:3:1.5) as the mobile phase. Apply separately to the plate 2 μ l each of four solutions (1) 50 mg per ml of the substance to be examined in water, (2) 1.5 mg per ml of etimicin CRS in water, (3) 2.5 mg per ml of etimicin CRS in water, and (4) 2.0 mg per ml of gentamycin C_{1a} in solution (1). After developing and removal of the plate, allow it to dry in air, heat at 110°C for 10 minutes and expose it to iodine vapor. The spots of etimicin and gentamycin C_{1a} in the chromatogram obtained with solution (4) are separated completely, any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (3 per cent), and not more than one such spot more intense than the spot obtained with solution (3) (5 per cent).

Dichloromethane To about 0.12 g, accurately weighed, in headspace vials, add accurately 3 ml of water, dissolve and seal as test solution. Dilute a quantity with methanol to produce a solution containing 1.0 mg of dichloromethane per ml as reference stock solution, dilute a quantity of the reference stock solution, accurately measured, with water to produce a solution containing 24 μ l dichloromethane per

ml, measure accurately 3 ml of the solution into headspace vials, seal, as reference solution. Carry out the method for residual solvents (Appendix VIII P), using a capillary column packed with 5% diphenyl and 95% dimethyl silicone (or stationary phase with similar polarity). The gas chromatograph is equipped with a flame-ionization detector, the injection port temperature and the detector temperature are maintained at 120°C and 260°C, respectively. The column temperature is programmed according to the following steps. It is maintained at 50°C for 5 minutes, then increased to 200°C at a rate of 35°C per minute. Heat the sealed vial at 85°C for 30 minutes and inject 1 ml of the headspace. The resolution factor among principal peaks in the chromatogram obtained with the reference solution complies with related requirements. Inject separately each of test solution and reference solution, and record the chromatogram. Calculate the content with the peak area obtained in the chromatogram by the external standard method.

Water Not more than 10.0% (Appendix VIII M, method 1).

Residue on ignition Not more than 0.5% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.5 EU per 1 mg Etimicin.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (pH 0.8-8.0); a mixture of 0.2 mol/L trifluoroacetate-methanol (84:16) as the mobile phase; the flow rate is 0.5 ml per minute; The temperature of the drift tube of evaporative light-scattering detector (ELSD) is at 100°C, the flow of the carrier gas at 2.6 L per minute. Dissolve a quantity of etimicin and netilmicin CRS in water to produce a solution containing 0.2 mg per ml, respectively. Inject 20 μ l into the column and record the chromatogram. The resolution factor between the peaks of etimicin and netilmicin is not less than 1.2. The relative standard deviation (RSD) for 5 replicate injections is less than 2.0%.

Procedure Inject separately 20 μ l into the column each of three solutions with the mobile phase containing (1) 1.0 mg per ml, (2) 0.5 mg per ml and (3) 0.25 mg per ml of etimicin CRS and record the chromatogram. Based on the corresponding concentrations (C) and areas (A) of etimicin of solution (1), (2), and (3), the linear regression equation of log A versus log C can be determined. The correlation coefficient (r) of the regression equation should be greater than 0.99. Dissolve a quantity of substance to be examined with the mobile phase to produce a solution of 0.5 mg per ml and inject 20 μ l of the solution into the column. Calculate the content of $C_{21}H_{43}N_5O_7$ with respect to the regression equation.

Category Antibiotic.

Storage Preserve in hermetically sealed containers, store in a dry place.

Preparation (1) Etimicin Sulfate Injection
(2) Etimicin Sulfate for Injection

Etimicin Sulfate for Injection

Etimicin Sulfate for Injection is a sterile powder of

etimicin sulfate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of etimicin ($C_{21}H_{43}N_5O_7$), calculated with reference to the average weight of contents.

Description A white or almost white power or friable mass.

Identification Complies with the Identification tests described under Etimicin Sulfate.

Clarity and colour of solution To each of 5 containers add water to produce a solution of 0.25 mg per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix XI A, method 1).

Sterility Carry out the test for sterility (Appendix XI H, membrane filtration method). Dilute each vial with not less than 500 ml of 0.9% sterile Sodium Chloride Injection, the solution complies with the requirement.

pH value, Related substances, Water, Bacterial endotoxin complies with the corresponding requirements described under Etimicin Sulfate.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under Etimicin Sulfate, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Etimicin Sulfate.

Strength Calculate as $C_{21}H_{43}N_5O_7$
(1) 50 mg (2) 100 mg

Storage Preserve in well closed containers, store in a cool and dry place, protected from light.

Etimicin Sulfate Injection

Etimicin Sulfate Injection is a sterile solution of etimicin sulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of etimicin ($C_{21}H_{43}N_5O_7$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the tests for Identification described under Etimicin Sulfate.

pH value 5.0-7.0 (Appendix VI H).

Colour The solution is colourless; any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix XI A, method 1).

Related substances Complies with the corresponding requirements described under Etimicin Sulfate.

Sterility Carry out the test for sterility (Appendix XI H, membrane filtration method). Dilute each vial with not less than 500 ml of 0.9% sterile Sodium Chloride Injection, the solution complies with the requirement.

Bacterial endotoxin Complies with the corresponding requirements described under Etimicin Sulfate.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Measure accurately a quantity and carry out the Assay described under Etimicin Sulfate.

Category As described under Etimicin Sulfate.

Strength Calculate as $C_{21}H_{43}N_5O_7$
(1) 1 ml : 50 mg (2) 2 ml : 100 mg

Storage Preserve in well closed containers.

Etomidate

$C_{14}H_{16}N_2O_2$ 244.29

[33125-97-2]

Etomidate is (+) -Ethyl 1- (α -methylbenzyl) imidazole-5-carboxylate. It contains not less than 98.5% of $C_{14}H_{16}N_2O_2$, calculated on the dried basis.

Description White crystals or a crystalline powder. Very soluble in ethanol or chloroform; freely soluble in dilute hydrochloric acid; insoluble in water.

Melting range 66-70°C (Appendix VI C).

Specific optical rotation +67° to +72°, in a solution of 10 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve a quantity of etomidate in dilute hydrochloric acid. Add a few drops of potassium iodobismuthate TS; a brick-red precipitate is produced.

(2) The light absorption of the solution of 10 μ g per ml in ethanol exhibits a maximum at 241 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of etomidate (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol -0.062% ammonium acetate solution (60:40) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of etomidate. The resolution factor between the peaks of etomidate and degradation products complies with the related requirements.

Procedure Dissolve a quantity of the substance being examined in mobile phase to produce a solution of 1 mg per ml, as the test solution. Dilute 1 ml of test solution, accurately measured, with the mobile phase to the volume of 100 ml volumetric flask, mix well, as prepared solution. Inject 5 μ l of prepared solution into the column, adjust the attenuation so that the height of the principal peak is about 15% of the full scale of the chart. Inject 5 μ l of test into the column, record the chromatogram. Measure the peak areas of degradation products and etomidate, the percentage of degradation products is not more than 0.5%, calculated by normalized method.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Sulfate Shake 0.5 g with 40 ml of water, add 2 ml of dilute hydrochloric acid, shake thoroughly to dissolve etomidate. Carry out the limit test for sulfate (Appendix VIII B), using the resulting solution. Any opalescence produced is not more

pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.02%).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add two drops of naphtholbenzein IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.43 mg of $C_{14}H_{16}N_2O_2$.

Category Anesthetic.

Storage Preserve in tight glass containers, store in cool place and protected from light.

Preparation Etomidate Injection

Etomidate Injection

Etomidate Injection is sterile solution of etomidate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of etomidate ($C_{14}H_{16}N_2O_2$).

Description A clear, colourless liquid.

Identification (1) To 1 ml add a few drops of potassium iodobismuthate TS; a brick-red precipitate is produced. (2) The light absorption of solution obtained in the Assay exhibits a maximum at 241 nm (Appendix IV A).

pH value 5.0-6.5 (Appendix VI H).

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce a solution of 1 ml per ml. Carry out the method for related substances described under etomidate, record the chromatogram. The elution order is propylene glycol, degradation products and etomidate. Measure the peak areas of degradation products and etomidate; the percentage of degradation products is not more than 1.4%, calculated by normalization method.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute 5 ml of the test solution, accurately measured, with ethanol to produce a solution of 10 µg per ml. Measure the absorbance at 241 nm (Appendix IV A). Calculate the content of $C_{14}H_{16}N_2O_2$, taking 501 as the value of A (1%, 1 cm).

Category As described under Etomidate.

Strength 10 ml:20 mg

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Etoposide

$C_{29}H_{32}O_{13}$ 588.56

[33419-42-0]

Etoposide is 4'-Demethylepipodophyllotoxin 9-[4,6-O-(R)-ethylidene-β-D-glucopyranoside]. It contains not less than 95.0% and not more than 103.0% of $C_{29}H_{32}O_{13}$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odorless; hygroscopic.

Sparingly soluble in acetone, slightly soluble in methanol or trichloromethane, very slightly soluble in ethanol, practically insoluble in water.

Specific optical rotation -110° to -118° , in a solution of 5 mg per ml in a mixture of trichloromethane-methanol (90:10) (Appendix IV E).

Identification (1) Dissolve a quantity of substance being examined in 1 ml of methanol, add a few drops of 10% α-naphthol in methanol and mix well, add cautiously 2 ml of sulfuric acid along the inner wall of the tube. A purplish-brown ring is developed at the interface of the two layers. (2) The retention time of the principal peak in the chromatogram of the test solution obtained under the Assay corresponds with that of the principal peak in the chromatogram of the reference solution. (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of etoposide (Appendix XVI).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in a mixture of acetonitrile-acetate BS (pH 4.0) (30:70) to produce a test solution of 2 mg per ml. Measure accurately a quantity of the test solution and dilute with a mixture of acetonitrile-acetate BS (pH 4.0) (30:70) to produce a reference solution of 10 µg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with phenylsilane bonded silica gel, a mixture of acetonitrile-acetate BS (pH 4.0) (dissolve 5.44 g of sodium acetate with 2000 ml of water, adjust to pH 4.0 with glacial acetic acid) (20:80) as mobile phase A, and the mixture of acetonitrile-acetate BS (pH 4.0) (40:60) as mobile phase B, and performing the gradient elution program as the following table. The flow rate is 1.5 ml per minute. Detection wavelength is at 254 nm. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10%-15% full scale of the chart. Dissolve a quantity of propyl p-hydroxybenzoate with the mixture of acetonitrile-acetate BS (pH 4.0) (30:70) to produce a solution of 0.2 mg per ml, measure 1 ml and 1 ml of the test solution into a 200 ml volumetric flask, dilute with the mixture of acetonitrile-

acetate BS (pH 4.0) (30:70) to volume, mix well. Inject 20 μ l of the resulting solution into the column. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of etoposide, and the resolution factor between the peak of etoposide and propyl *p*-hydroxybenzoate is not less than 1.1. Inject separately 20 μ l each of the test solution and the reference solution into the column, record the chromatogram for 40 minutes. Disregard any peak due to the solvent and the gradient elution, the sum of the areas of all peaks other than the principal peak is not greater than 4 times of the area of principal peak in the chromatogram obtained with the reference solution.

Time (min)	Mobile Phase A	Mobile Phase B
0	100%	0%
15	100%	0%
30	40%	60%
40	40%	60%
42	0%	100%
45	0%	100%
47	100%	0%
50	100%	0%

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with phenylsilane bonded silica gel and a mixture of acetonitrile-acetate buffer (pH 4.0) (30:70) as the mobile phase. Detection wavelength is 254 nm, and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of etoposide.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce a solution of 0.2 ml per ml as test solution. Inject 20 μ l of the test solution into the column, record the peak area correspondingly obtained in the chromatogram. Repeat the operation, using the etoposide CRS instead of the substance being examined as reference solution. Calculate the content of $C_{29}H_{32}O_{13}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antineoplastic agent.

Storage Preserved in tightly closed containers, stored in a dry place and protected from light.

Preparation Etoposide Injection

Etoposide Injection

Etoposide Injection is a sterile solution of etoposide in a mixture of polyethylene glycol 400 and anhydrous ethanol. It contains not less than 90.0% and not more than 110.0% of the labelled amount of etoposide ($C_{29}H_{32}O_{13}$).

Description A clear, colourless to pale yellow liquid.

Identification (1) Transfer about 2 ml to a test tube, add a few drops of 10% α -naphthol in methanol, mix well, add cautiously 2 ml of sulfuric acid along the inner wall of the test tube. A purplish-brown ring is developed at the interface of two layers.

(2) The retention time of the principal peak in the chromatogram of the test preparation obtained under the Assay corresponds with that of the principal peak in the chromatogram of the reference preparation.

pH value To 5 ml, add 45 ml of water, mix well, pH 3.0-4.0 (Appendix VI H).

Colour The solution is not more intense than that of the reference solution Y_3 (Appendix IX A, method 1).

Related substances Measure accurately 1 ml into a 10 ml volumetric flask, dilute with acetonitrile-acetate BS (pH 4.0) (30:70) to volume, mix well as test solution. Carry out the method as described under Etoposide for the Related substances. Disregard any peak caused by the solvent, the gradient elution, and the ingredients such as citric acid, benzyl alcohol and benzaldehyde, the sum of areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than 6 times of the area of the principal peak in the chromatogram obtained with the reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 2 EU per mg of etoposide.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well. Measure accurately 10 ml of the resulting solution into a 50 ml volumetric flask, dilute with mobile phase to volume, mix well as test solution. Carry out the method as described under Etoposide for the Assay, calculate the content of $C_{29}H_{32}O_{13}$.

Category As described under Etoposide.

Strength (1) 2 ml:40 mg (2) 5 ml:100 mg

Storage Preserved in well closed containers, protected from light.

Famciclovir

$C_{14}H_{19}N_5O_4$ 321.34

Famciclovir is 2-[2-(2-Amino-9H-purin-9-yl)ethyl]-1,3-propanediol diacetate (ester). It contains not less than 98.5% of $C_{14}H_{19}N_5O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odorless; taste, bitter.

Freely soluble in water, methanol, ethanol or chloroform; sparingly soluble in ethyl acetate; practically insoluble in ether.

Melting point 102-104°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 20 µg per ml in water at 305 nm (Appendix IV A), the value of A (1%, 1 cm) is 205-220.

Identification (1) The light absorption of a solution of 10 µg per ml in water exhibits maxima at 221 nm, 243 nm and 305 nm (Appendix IV A).

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of famciclovir CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of famciclovir (Appendix XVI).

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, pH 6.0-7.5 (Appendix VI H).

Related substances Carry out the method as described under Assay except that detection wavelength is 221 nm. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 0.1 mg per ml as the test solution. Transfer 1 ml of test solution, accurately measured, to a 100 ml volumetric flask, dilute with mobile phase to volume to produce a reference solution. Inject 20 µl of reference solution into the column, adjust the attenuation so that the height of the principle peak in the chromatogram is 20%-25% of the full scale of the chart; inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for 2.5 times of the retention time of the principal peak. Each impurity peak area in the chromatogram obtained with the test solution is not great than 1/2 of area of the principal peak in the chromatogram obtained with the reference solution, and the sum of the areas of all the peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than area of the principal peak in the chromatogram obtained with the reference solution.

Residual solvents Carry out the method for determination of Residual solvents (Appendix VIII P, method 1), using a capillary column packed with 5% phenyl-methylsiloxane, maintain the column temperature at 50°C, injection port temperature at 200°C and detector temperature at 250°C, and using a flame ionization detector. To 0.25 g, accurately weighed, add accurately 5 ml of water, in a headspace sample vial. Dissolve a quantity of dichloromethane, methanol and ethyl acetate, accurately weighed, in water to produce a reference solution. Calculate the content of methanol, ethyl acetate and dichloromethane respectively with respect to the peak area obtained in the chromatogram by the external standard method.

Loss on drying When dried in vacuum to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.02 mol/L potassium dihydrogen phosphate solution (20:80) as the mobile phase. Detection wavelength is 305 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of famciclovir.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 50 µg per ml. Inject 20 µl into the column. Repeat the operation, using famciclovir CRS instead of the substance being examined. Calculate the content of $C_{14}H_{19}N_5O_4$, with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antivirus.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Famciclovir Tablets
(2) Famciclovir Capsules

Famciclovir Capsules

Famciclovir Capsules contain not less than 90.0% and not more than 110.0% of labelled amount of famciclovir ($C_{14}H_{19}N_5O_4$).

Description The contents are white or almost white powder.

Identification (1) Dissolve a quantity of the contents of the capsules in water to produce a solution of 10 µg of famciclovir per ml and filter. The filtrate exhibits maxima at 221 nm, 243 nm and 305 nm (Appendix IV A).

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of famciclovir CRS in the chromatogram of the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of successive filtrate with water to produce a solution of 25 µg per ml. Dissolve famciclovir CRS, accurately weighed, in water to produce a solution of 25 µg per ml. Measure the absorbance of the resulting solution at 305 nm respectively (Appendix IV A). Calculate the dissolution of $C_{14}H_{19}N_5O_4$ from each capsule, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents in the test for weight variation in mobile phase to produce a solution of 50 µg of famciclovir per ml, shake well and filter. Carry out the Assay described under Famciclovir using the successive filtrate as the test solution.

Category As described under Famciclovir.

Strength 0.125 g

Storage Preserve in tightly closed containers.

Famciclovir Tablets

Famciclovir Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of famciclovir ($C_{14}H_{19}N_5O_4$).

Description White to almost white tablets or film coated tablets with white to almost white core.

Identification (1) Dissolve a quantity of powdered tablets (with coating removed) in water to produce a solution of 10

μg of famciclovir per ml and filter. The filtrate exhibits maxima at 221 nm, 243 nm and 305 nm (Appendix IV A).
(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of famciclovir CRS in the chromatogram of the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of successive filtrate with water to produce a solution of 25 μg per ml. Dissolve famciclovir CRS, accurately weighed, in water to produce a solution of 25 μg per ml. Measure the absorbance of the resulting solution at 305 nm respectively (Appendix IV A). Calculate the dissolution of $\text{C}_{14}\text{H}_{19}\text{N}_5\text{O}_4$ from each tablet, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powdered tablets in mobile phase to produce a solution of 50 μg of famciclovir per ml, mix well and filter. Carry out the Assay described under Famciclovir using the successive filtrate as the test solution.

Category As described under Famciclovir.

Strength (1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers.

Famotidine

$\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$ 337.45

[76824-35-6]

Famotidine is [1-Amino-3-[[[2-[(diaminomethyl)amino]-4-thiazolyl]-methyl]thio]propylidene] sulfamide. It contains not less than 98.0% of $\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; taste, slightly bitter; gradually darkening on exposure to light.

Slightly soluble in methanol; very slightly soluble in acetone; practically insoluble in water or chloroform; freely soluble in glacial acetic acid.

Melting range 160-165°C, with decomposition (Appendix VI C).

Identification (1) The light absorption of the solution of 15 μg per ml in phosphate buffer solution (Dissolve 13.6 g of potassium dihydrogen phosphate in water to make 1000 ml and adjust the pH to 4.5 with appropriate acid or base) exhibits a maximum at 266 nm; the absorbance is 0.45-0.48 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of famotidine (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (50 : 25 : 3) as the mobile phase. Apply separately to the plate 10 μl each of the

following solutions. For solution (1) dissolve 0.20 g of famotidine in 0.5 ml of dimethylformamide and dilute with methanol to 10 ml. For solution (2) measure accurately a quantity of solution (1) and dilute with methanol to produce a solution of 0.4 mg per ml. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (2.0%).

Methanol Carry out the method for Determination of residual solvent (Appendix VIII P, method 3). Transfer about 0.8 g of famotidine, accurately weighed, to a 10 ml volumetric flask, dilute with water to volume. Allow it to stand for 30 minutes in a water bath at about 50°C with shaking every 5 minutes, filter through a membrane with a pore size of about 0.8 μm and use the filtrate as the test solution. Dilute a quantity of methanol, accurately measured, with water to produce a solution of 10 μl (equivalent to 7.9 mg) per 100 ml as the reference solution. Using porous polymer beads of ethylvinylbenzene-divinylbenzene with a diameter of 0.18-0.25 mm as the stationary phase and maintain the column temperature at 100°C \pm 10°C.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.12 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of acetic anhydride, add 1 drop of crystal violet TS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 16.87 mg of $\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$.

Category Histamine H₂ receptor antagonist.

Storage Preserve in tightly closed containers and protected from light.

Preparation (1) Famotidine Capsules
(2) Famotidine Injection
(3) Famotidine Tablets

Famotidine Capsules

Famotidine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of famotidine ($\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$).

Description Hard capsule with a white or almost white crystalline powder.

Identification (1) The light absorption of the solution obtained in Dissolution exhibits a maximum at 266 nm (Appendix IV A).

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of famotidine CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate buffer solution (Dissolve 13.6 g of potassium dihydrogen phosphate in water to make 1000 ml, mix well and adjust the pH to 4.5 with appropriate acid or base) as the dissolution medium, adjust

the rotational speed of the basket to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same dissolution medium to produce a solution of 10 µg per ml as the test solution. Dissolve an accurately weighed quantity of famotidine CRS, in phosphate buffer solution (pH4.5) to produce a solution of 10 µg per ml as the reference solution. Measure the absorbance of the resulting solutions at 266 nm (Appendix IV A). Calculate the dissolution of $C_8H_{15}N_7O_2S_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium heptanesulfonate solution (dissolve 2.0 g of sodium heptanesulfonate in 900 ml of water, adjust the pH to 3.9 with glacial acetic acid and dilute with water to 1000 ml)-acetonitrile-methanol (25 : 6 : 1) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1400, calculated with reference to the peak of famotidine. Weigh accurately a quantity of the mixed contents obtained from the test for Weight variation, equivalent to about 50 mg of famotidine, into 50 ml volumetric flask, shake with a quantity of methanol to dissolve famotidine, dilute with methanol to volume, mix well and filter. Transfer 5 ml of successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with mobile phase to volume, mix well, inject accurately measured 20 µl into the column, record the chromatogram. Weigh accurately a quantity of famotidine CRS, into 50 ml volumetric flask, add a quantity of methanol to dissolve famotidine, dilute with methanol to volume, mix well and filter. Transfer 5 ml of successive filtrate, accurately measured, in 50 ml volumetric flask, dilute with mobile phase to volume, mix well. Repeat the operation, calculate the content of $C_8H_{15}N_7O_2S_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Famotidine.

Strength 20 mg

Storage Preserve in tightly closed containers and protected from light.

Famotidine Injection

Famotidine Injection is a sterile solution of Famotidine in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of famotidine ($C_8H_{15}N_7O_2S_3$).

Description A clear, colourless to pale yellow liquid.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of famotidine CRS.

Colour of solution Any colour produced is not more intense than that of reference solution Y₃ (Appendix IX A, method 1).

pH value 4.5-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed

with octadecylsilane bonded silica gel and a mixture of sodium heptanesulfonate solution (dissolve 2.0 g of sodium heptanesulfonate in 900 ml of water, adjust the pH to 3.9 with glacial acetic acid and dilute with water to 1000 ml) acetonitrile-methanol (25 : 6 : 1) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1400, calculated with reference to the peak of famotidine. Transfer 2 ml of the injection, accurately measured, to a 50 ml volumetric flask, add 5 ml of methanol, dilute with mobile phase to volume, mix well. Measure accurately 5 ml to 20 ml volumetric flask, dilute with mobile phase to volume, mix well, inject accurately measured 20 ml into the column. Weigh accurately 50 mg of famotidine CRS in a 50 ml volumetric flask, add a quantity of methanol to dissolve famotidine and dilute to volume with methanol. Mix well, measure accurately 5 ml to a 50 ml volumetric flask, dilute to volume with mobile phase, mix well. Repeat the operation, calculate the content of $C_8H_{15}N_7O_2S_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Famotidine.

Strength 2 ml : 20 mg.

Storage Preserve in well closed containers and protected from light.

Famotidine Tablets

Famotidine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of famotidine ($C_8H_{15}N_7O_2S_3$).

Description White tablets, sugar coated tablets or film coated tablets with white or almost white core.

Identification (1) The light absorption of the solution obtained in Content uniformity exhibits a maximum at 266 nm (Appendix IV A).

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of famotidine CRS.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). To 1 tablet (for strength 10 mg) in a 100 ml volumetric flask add 40 ml of phosphate buffer solution (Dissolve 13.6 g of potassium dihydrogen phosphate in water to make 1000 ml, mix well and adjust the pH to 4.5 with appropriate acid or base) and shake to dissolve famotidine. Dilute with phosphate buffer solution (pH4.5) to volume, mix well and filter. Discard the initial filtrate. Dilute an accurately measured quantity of the successive filtrate with phosphate buffer solution (pH4.5) to produce a solution of 10 µg per ml as the test solution. Measure the absorbance of the resulting solution at 266 nm (Appendix IV A). Dissolve an accurately weighed quantity of famotidine CRS in phosphate buffer solution (pH4.5) to produce a solution of 10 µg per ml as the reference solution. Repeat the operation, Calculate the content of $C_8H_{15}N_7O_2S_3$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of potassium dihydrogen phosphate buffer solution (pH4.5) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same dissolution medium to produce a solution of 10 µg per ml as the test solution. Carry out the procedure

described under Content uniformity beginning at the words "Measure the absorbances of..." Calculate the dissolution of $C_{18}H_{19}Cl_2NO_4$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium heptanesulfonate solution (dissolve 2.0 g of sodium heptanesulfonate in 900 ml of water, adjust the pH to 3.9 with glacial acetic acid and dilute with water to 1000 ml)-acetonitrile-methanol (25 : 6 : 1) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1400, calculated with reference to the peak of famotidine.

Procedure Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powdered tablets equivalent to about 50 mg of famotidine in a 50 ml volumetric flask add a quantity of methanol, shake to dissolve famotidine, dilute with methanol to volume, mix well and filter. Transfer 5 ml of successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with mobile phase to volume, mix well as the test solution. Inject accurately measured 20 μ l into the column, record the chromatogram. Weigh accurately 50 mg of famotidine CRS, in a 50 ml volumetric flask, add a quantity of methanol to dissolve famotidine and dilute to volume with methanol. Mix well, measure accurately 5 ml to a 50 ml volumetric flask, dilute to volume with mobile phase, mix well. Repeat the operation. Calculate the content of $C_{18}H_{19}Cl_2NO_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Famotidine.

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers and protected from light.

Felodipine

$C_{18}H_{19}Cl_2NO_4$ 384.25

Felodipine is 4-(2,3-dichlorophenyl)-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylic ethyl methyl ester. It contains not less than 98.5% of $C_{18}H_{19}Cl_2NO_4$, calculated on the dried basis.

Description A white to slight yellow crystals or a crystalline powder; odourless; tasteless. Unstable on exposure to light.

Freely soluble in acetone, methanol or ethanol; practically insoluble in water.

Melting range 141-145°C (Appendix VI C).

Identification (1) Dissolve 20 mg in 1 ml of hydrochloric acid. Add 1 ml of hydroxylamine hydrochloride TS, mix well. Make the solution alkaline by adding dropwise 20%

sodium hydroxide solution. Boil for about 30 minutes on a water bath, and cool. Acidify with 1 mol/L hydrochloric acid solution. Add a few drops of ferric chloride TS, a reddish-brown colour is produced.

(2) The light absorption of a solution of 2 μ g per ml in ethanol exhibits two maxima at 238 nm and 361 nm (Appendix VI A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of felodipine (Appendix XVI).

Clarity and colour of solution Dissolve 1.0 g in 20 ml of methanol, the solution is clear and colourless; any colour produced, the absorbance of the solution at 440 nm is not more than 0.10 (Appendix IX A, method 2).

Chloride To 2.0 g add 50 ml of water, boil and cool immediately, add water to restore 50 ml. Filter, carry out the limit test for chloride (Appendix IV A) using 25 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.005%).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce solutions of 1.0 mg per ml as test solution and 15 μ g per ml as reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-phosphate BS [mix 8.0 ml of phosphoric acid solution (6.5 \rightarrow 1000) with 50.0 ml of 15.6% sodium dihydrogen phosphate solution, dilute to 1000 ml with water] (2 : 1 : 2) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of felodipine. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Isopropyl Ether Dissolve a quantity of the substance being examined, accurately weighed, in dimethylformamide by ultrasonication to produce the test solution of 60 mg per ml. Dissolve about 0.3 g isopropyl ether, weigh accurately, in a 100 ml volumetric flask with dimethylformamide, dilute with dimethylformamide to volume and mix well. Transfer 3 ml of the solution into a 50 ml volumetric flask, accurately measured, dilute with dimethylformamide, to volume, mix well, as the reference solution. Transfer separately 15 ml each of above solutions to different headspace sample vials with a volume of 20 ml and seal. Heat the vials in water bath, maintained at 80°C for 2 hours. Withdraw separately 70 μ l each of the head space gas of the test solution and the reference solution, carry out the method for gas chromatography (Appendix V E), using a column (2 m long) packed with styrene divinylbenzene copolymer as the stationary phase, maintain the column temperature at 190°C. The peak area of isopropyl ether obtained with the test solution is not greater than that obtained with the reference solution (0.3%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Mix 1.0 g with 1.0 g calcium hydroxide, add little water and mix. Heat gently and ignite until the incineration is complete. Dissolve the cooled residue in 8 ml of hydrochloric acid and 20 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.3 g, accurately weighed, in 40 ml of glacial acetic acid, add 20 ml of dilute sulfuric acid TS and 2 drops of *o*-phenanthroline IS, titrate with cerium sulfate (0.1 mol/L) VS until the orange colour disappears. Perform a blank determination and make any necessary correction. Each ml of cerium sulfate (0.1 mol/L) VS is equivalent to 19.21 mg of $C_{18}H_{19}Cl_2NO_4$.

Category Calcium channel blocker.

Storage Preserve in tightly closed containers, protected from light.

Preparation Felodipine Tablets

Felodipine Tablets

Felodipine Tablets contain not less than 90% of and not more than 110.0% of the labelled amount of felodipine ($C_{18}H_{19}Cl_2NO_4$).

Description White or almost white tablets.

Identification (1) To a quantity of powdered tablets (equivalent to about 20 mg of felodipine) add 20 ml of ethanol, shake to dissolve felodipine and filter. Evaporate the filtrate to about 1 ml on a water bath, add 1 ml of hydrochloric acid, the solution complies with the test for identification (1) described under Felodipine, beginning at the words "add 1 ml of hydroxylamine hydrochloride TS...".

(2) Dilute the test solution under Related substances with the mobile phase to produce the test solution of 200 μ g per ml. Dissolve a quantity of felodipine CRS, accurately weighed, in the mobile phase to produce the reference solution of 200 μ g per ml. Carry out the method as described under Related substances. The retention time of the principal peak of the substance being examined in the chromatogram of the test solution is identical with that of felodipine CRS in the chromatogram of the reference solution.

(3) The light absorption of the solution obtained in the Assay exhibits two maxima at 238 nm and 361 nm (Appendix VI A).

Related substances Dissolve a quantity of the powdered tablets, accurately weighed, in the mobile phase to produce a solution containing felodipine of 1 mg per ml, ultrasonicate to dissolve felodipine and filter, using the successive filtrate as the test solution. Measure accurately a quantity of the test solution, dilute with the mobile phase to produce the reference solution containing felodipine of 20 μ g per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-hosphate BS [mix 8.0 ml of phosphoric acid solution (6.5 → 1000) with 50.0 ml of 15.6% sodium dihydrogen phosphate solution, dilute to 1000 ml with water] (2 : 1 : 2) as the mobile phase. Detection wavelength is 254 nm and the number of the

theoretical plates of the column is not less than 1500, calculated with reference to the peak of felodipine. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks, other than the principal peak and the peak of auxiliary whose related retention time is about 0.3 corresponding to the principal peak, in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with ethanol in a mortar and transfer with ethanol in portions to a 50 ml volumetric flask, dilute with ethanol to volume, shake thoroughly and filter. Measure accurately a quantity of the successive filtrate, dilute with ethanol to produce a solution containing felodipine of 20 μ g per ml. Carry out the procedure described under Assay of Felodipine Tablets. Calculate the content of $C_{18}H_{19}Cl_2NO_4$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of 0.1 mol/L hydrochloric acid solution-isopropanol (3 : 2) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 30 minutes and filter, using the successive filtrate as the test solution. Measure the absorbance at 361 nm (Appendix IV A) in 1 cm cell (for strength 10 mg or 5 mg) or 2 cm cell (for strength 2.5 mg), calculate the dissolution of $C_{18}H_{19}Cl_2NO_4$ from each tablet, taking 182 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of powder equivalent to about 10 mg of felodipine into a 100 ml volumetric flask, add a quantity of ethanol, shake for 15 minutes to dissolve felodipine, dilute with ethanol to volume and mix well. Filter and transfer 2 ml of the successive filtrate to a 10 ml volumetric flask, accurately measured, dilute with ethanol to volume and mix well, measure the absorbance at 361 nm (Appendix VI A), calculate the content of $C_{18}H_{19}Cl_2NO_4$, taking 182 as the value of A (1%, 1 cm).

Category As described under Felodipine.

Strength (1) 2.5 mg (2) 5 mg (3) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Fenbufen

$C_{16}H_{14}O_3$ 254.28

[36330-85-5]

Fenbufen is 3-(4-diphenylcarbonyl) propionic

acid. It contains not less than 98.5% of $C_{16}H_{14}O_3$,
calcu lated on the dried basis.

Descri **ption** A white or almost white crystalline powder;
 odour less; taste, sour.
Solub le in ethanol; practically insoluble in water; freely
 solub le in hot alkaline solution.

Melti **ng point** 185-188°C (Appendix VI C).

Ident **ification** (1) To about 0.1 g add 2 ml of sulfuric acid;
 the s olution turns to orange-red colour; dilute with water,
 the c olour is disappeared and a white precipitate is produced.
 (2) To about 0.1 g add 5 ml of dehydrated ethanol, warm
 to di ssolve, cool, add dropwise of ferric trichloride TS; an
 oran; ge-yellow precipitate is produced.
 (3) The light absorption of a solution of 5 µg per ml in dehy
 drated ethanol exhibits a maximum at 281 nm; a mini
 mum at 238 nm (Appendix IV A).
 (4) The infrared absorption spectrum (Appendix IV C) is
 conc ordant with the reference spectrum of Fenbufen
 (Ap pendix XVI)

Chlo **ride** Spread 2 g of anhydrous sodium carbonate on the
 bott om and around of a crucible, place 1.0 g, upon the
 anhy drous sodium carbonate, moisten with a few quantity of
 wat er, heat to dry, then heat gently until it is thoroughly
 char red, ignite at 700-800°C until the incineration is
 com plete, allow to cool. Dissolve the residue with a
 qua ntity of water, filter, wash the crucible and the filter
 wit h water, combine the filtrate and washings to a 50 ml
 volu metric flask, dilute with water to volume, mix well,
 mea sure accurately 10 ml, dilute with water to 25 ml. Carry
 out the limit test for chlorides (Appendix VIII A). Any
 opalescence produced is not more intense than that of a
 ref erence using 6.0 ml of sodium chloride standard solution
 (0.03%).

Sul **fate** Measure accurately 10.0 ml of the remained solution
 obt ained in the test for chloride, dilute with water to 25 ml,
 car ry out the limit test for sulfates (Appendix VIII B). Any
 opa lescence produced is not more intense than that of a
 ref erence using 2.0 ml of potassium sulfate standard solution
 (0.1%).

Re **lated substances** Carry out the method for thin layer
 chr omatography (Appendix V B), using silica gel GF₂₅₄ as
 the c oating substance and a mixture of benzene-chloroform-
 glaacial acetic acid (10:10:1) as the mobile phase. Apply
 sep arately to the plate 10 µl each of two solutions of the
 su bstance being examined in dehydrate ethanol containing
 (1) 5 mg per ml, (2) 0.1 mg per ml. After developing and
 re moval of the plate, dry in air, examine under an
 ul traviolet light (254 nm). Any spot other than the
 pr incipal spot in the chromatogram, obtained with solution
 (1) is not more intense than the principal spot obtained with
 sc lution (2).

L **oss on drying** When dried to constant weight at 105°C,
 lo sses not more than 1.0% of its weight (Appendix VIII L).

R **esidue on ignition** Not more than 0.1% (Appendix VIII
 N D), use 1.0 g.

H **heavy metals** Carry out the limit test for heavy metals
 (Appendix VIII H method 2), using the residue obtained in
 the test for Residue on ignition; not more than 0.001%.

A **rsenic** Measure accurately 10.0 ml of the remained
 so lution obtained in the test for chloride, add 5 ml of
 h ydrochloric acid and 13 ml of water, carry out the limit test
 fo r arsenic (Appendix VIII J, method 1); not more
 t han 0.001%.

A **ssay** Dissolve 0.4 g, accurately weighed, in 50 ml of
 r eutral ethanol, by warming in a hot water bath, cool to

room temperature, add 2 drops of phenolphthalein IS,
 titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of
 sodium hydroxide (0.1 mol/L) VS is equivalent to 25.43
 mg of $C_{16}H_{14}O_3$.

Category Analgesic, non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected
 from light.

Preparation (1) Fenbufen Capsules
 (2) Fenbufen Tablets

Fenbufen Capsules

Fenbufen Capsules contain not less than 90.0%
 and not more than 110.0% of the labelled amount
 of Fenbufen ($C_{16}H_{14}O_3$).

Identification To a quantity of the contents of capsules
 equivalent to about 0.2 g of Fenbufen add 20 ml of anhydrous
 ethanol, heat on a water bath to dissolve Fenbufen, allow to
 cool and filter. The filtrate complies with the tests (1),
 (2) and (3) for Identification described under Fenbufen
 tablets.

Dissolution Carry out the method for dissolution test
 (Appendix X C, method 1), using 900 ml of phosphate BS
 (pH 7.6) as the dissolution medium. Adjust the rotation
 speed at 100 rpm. Withdraw 10 ml of the solution after
 exactly 45 minutes, filter. Measure accurately 2 ml of the
 successive filtrate into a 50 ml volumetric flask, dilute with
 phosphate BS (pH 7.6) to volume, mix well. Measure the
 absorbance of the resulting solution at 285 nm, (Appendix
 IV A) and calculate the content of $C_{16}H_{14}O_3$, taking 868 as
 the value of A (1%, 1 cm). The dissolution for each
 capsules is not less than 70% of the labelled amount.

Other requirements Comply with the general requirements
 for capsules (Appendix I E).

Assay Dissolve a quantity, weighed accurately, of the
 mixed contents obtained in test for weight variation for
 contents equivalent to about 0.4 g of fenbufen in 50 ml of
 neutral ethanol by warming in a hot water bath. Allow to
 cool, add 2 drops of phenolphthalein IS, titrate with sodium
 hydroxide (0.1 ml/L) VS. Each ml of sodium hydroxide
 (0.1 mol/L) VS is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

Category As described under Fenbufen.

Strength 0.15 g.

Storage Preserve in tightly closed containers, protected
 from light.

Fenbufen Tablets

Fenbufen Tablets contain not less than 90.0% and
 not more than 110.0% of the labelled amount of
 Fenbufen ($C_{16}H_{14}O_3$).

Description White or almost white tablets.

Identification To a quantity of the powdered tablets
 equivalent to about 0.2 g of Fenbufen add 20 ml of anhydrous
 ethanol, heat on a water bath to dissolve Fenbufen, allow to
 cool and filter. The filtrate complies with the tests as
 follows.

(1) To 5 ml of the filtrate add 5 drops of Ferric trichloride
 TS, an orange precipitate is produced.

(2) Evaporate 10 ml of the filtrate to dryness on a water bath, add 1 ml of sulfuric acid to the residue, the solution turns gradually to orange-red colour; the colour is disappeared and a white precipitate is produced on diluting with 10 ml of water.

(3) Dilute the filtrate with anhydrous ethanol to produce a solution of 5 µg per 1 ml. The light absorption of the solution exhibits a maximum at 281 nm and a minimum at 238 nm (Appendix IV A).

Dissolution Carry out the method for dissolution test (Appendix X C, method 2) using 900 ml of phosphate BS (pH 7.6) as the dissolution medium. Adjust the rotational speed to 100 rpm. Withdraw 10 ml of solution after exactly 45 minutes and filter. Discard the initial filtrate, measure accurately 2 ml of the successive filtrate to a 50 ml (for 0.15 g strength) or 100 ml (for 0.3 g strength) volumetric flask, dilute with phosphate BS (pH 7.6) to volume and mix well. Measure the absorbance at 285 nm. (Appendix IV A) Calculate the dissolution of $C_{16}H_{14}O_3$ of each tablet, taking 868 as the value of A (1%, 1 cm). Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets. (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of powdered tablets equivalent to about 0.4 g of Fenbufen, with 50 ml of neutral ethanol by heating on a water bath. Allow to cool, add 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.

Category As described under Fenbufen.

Strength (1) 0.15 g (2) 0.3 g

Storage Preserve in tightly closed containers, protected from light.

Fenofibrate

$C_{20}H_{21}ClO_4$ 360.84

[49562-28-9]

Fenofibrate is Isopropyl 2- [p- (p-chlorobenzoyl) phenoxy] -2-methylpropanoate. It contains not less than 98.5% of $C_{20}H_{21}ClO_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless. Very soluble in chloroform; freely soluble in acetone or ether; sparingly soluble in ethanol; practically insoluble in water.

Melting range 78-82°C (Appendix VI C).

Identification (1) The light absorption of a 10 µg per ml solution in dehydrated ethanol exhibits a maximum at 286 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fenofibrate (Appendix XVI).

(3) Weigh about 20 mg, carry out the method for oxygen

flask combustion (Appendix VI C), using 10 ml of 0.4% sodium hydroxide solution as the absorbing liquid. When the process is completed, acidify the solution with dilute sulfuric acid and cool. The solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of ethanol solution A solution of 1.0 g in 25 ml of ethanol (heat gently if necessary) is clear and colourless; any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Sulfate To 1.0 g add 50 ml of water, shake and filter. Carry out the limit test for sulfate (Appendix VIII B), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 2.0 ml of potassium sulfate standard solution (0.040%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of benzene-ethylacetate-glacial acetic acid (90:10:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in a mixture of chloroform-ethanol (9:1) containing (1) 50 mg per ml, (2) 0.15 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum to constant weight at 50°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in test for Residue on ignition; not more than 0.001%.

Assay To about 2 g, accurately weighed, in 10 ml of neutralized ethanol by gentle heating. Add a few drops of phenolphthalein IS and titrate with alcoholic potassium hydroxide (0.1 mol/L) VS until a pink colour is produced. Add 25 ml of alcoholic potassium hydroxide (0.5 mol/L) VS, accurately measured, heat under reflux for 30 minutes. Rinse the condenser with 10 ml of water and allow the solution to cool, add 1 ml of phenolphthalein IS, titrate with hydrochloric acid (0.5 mol/L) VS until the red colour disappears. Perform a blank determination and make any necessary correction. Each ml of alcoholic potassium hydroxide (0.5 mol/L) VS is equivalent to 180.42 mg of $C_{20}H_{21}ClO_4$.

Category Antihyperlipoproteinemic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Fenofibrate Capsules
(2) Fenofibrate Tablets

Fenofibrate Capsules

Fenofibrate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of fenofibrate ($C_{20}H_{21}ClO_4$).

Identification (1) The light absorption of the solution obtained in the Assay (Appendix IV A), exhibits a maximum at 286 nm.

(2) Shake a quantity of the contents equivalent to about 0.1

g of fenofibrate with 10 ml of ether, filter, evaporate the filtrate to dryness. The residue complies with test (3) for Identification described under Fenofibrate.

Other requirements Comply with the general requirements for Ca_2^+ . Appendix I E.

Assay Mix the contents obtained in the test for Weight variation, transfer accurately a quantity equivalent to about 50 mg of fenofibrate to a 100 ml volumetric flask. Carry out the Assay described under Fenofibrate Tablets, beginning at the words "add about 75 ml of dehydrated ethanol".

Category As described under Fenofibrate.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Fenofibrate Tablets

Fenofibrate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of fenofibrate ($\text{C}_{20}\text{H}_{21}\text{ClO}_4$).

Description White or almost white tablets.

Identification (1) The light absorption of the solution obtained in Assay exhibits a maximum at 286 nm (Appendix IV A).

(2) Shake a quantity of powdered tablets equivalent to about 0.1 g of fenofibrate with 10 ml of ether, filter, evaporate the filtrate to dryness. The residue complies with test (3) for Identification described under Fenofibrate.

Related substances Shake a quantity of powdered tablets with a mixture of chloroform-ethanol (9:1) to dissolve the fenofibrate and to produce a solution of 20 mg per ml and filter, using the filtrate as the test solution. Measure accurately a quantity of filtrate, dilute with same solvent to produce a solution of 0.2 mg per ml as a reference solution. Complies with the Related substances described under Fenofibrate, beginning at the words proceeds "carry out the method for thin-layer chromatography".

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 50 mg of fenofibrate into a 100 ml volumetric flask, add 75 ml of dehydrated ethanol, shake thoroughly, dilute with dehydrated ethanol to volume, mix well and filter. Transfer accurately 2 ml of the successive filtrate to another 100 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the solution at 286 nm (Appendix IV A), calculate the content of $\text{C}_{20}\text{H}_{21}\text{ClO}_4$, taking 484 as the value of A (1%, 1 cm).

Category As described under Fenofibrate.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Fenoprofen Calcium

$\text{C}_{30}\text{H}_{26}\text{CaO}_6 \cdot \text{H}_2\text{O}$ 558.64

[53746-45-5]

Fenoprofen Calcium is α -methyl-3-phenoxy-benzene-acetic acid, calcium salt (2:1) dihydrate. It contains not less than 97.5% of $\text{C}_{30}\text{H}_{26}\text{CaO}_6$, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; tasteless. Soluble in ethanol; slightly soluble in methanol; very slightly soluble in water; practically insoluble in chloroform.

Identification (1) Warm to dissolve about 20 mg with 1 ml of acetic acid, add 1 drop of ammonium oxalate TS, a white precipitate is produced, which is soluble in hydrochloric acid.

(2) Dissolve about 0.1 g in 5 ml glacial acetic acid, add methanol to produce 100 ml, mix well. Dilute a quantity of the solution with methanol to produce a solution of 50 μg per ml in methanol. The light absorption of the solution exhibits maxima at 272 nm and 278 nm, a shoulder peak at 266 nm (Appendix IV A).

(3) The infra-red absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fenoprofen calcium (Appendix XVI).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and toluene-glacial acetic (10:1) as the mobile phase. Apply separately to the plate 20 μl each of two solutions in chloroform-methanol (1:1) containing (1) 50 mg per ml, (2) 0.25 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1), is not more intense than the principal spot obtained with solution (2).

Water 5.0%-8.0% (Appendix VIII M, method I A).

Calcium Warm to dissolve about 0.25 g, accurately weighed, with 15 ml of ethanol and 10 ml of water, add 15 ml of sodium hydroxide TS and about 0.1 g of calcon indicator, mix well, titrate with disodium edetate (0.05 mol/L) VS until the colour turns from purplish-red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.004 mg of Ca. It contains not less than 7.3%, and not more than 8.0% of Ca, calculated on the anhydrous basis.

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid and 2 ml of acetic anhydride, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour turns to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.13 mg of $\text{C}_{30}\text{H}_{26}\text{CaO}_6$.

Category Antipyretic and analgesic, non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers

Preparation Fenoprofen Calcium Tablets

Fenoprofen Calcium Tablets

Fenoprofen Calcium Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of Fenoprofen Calcium ($C_{15}H_{14}O_3$).

Description White tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to about 0.1 g of Fenoprofen Calcium in 5 ml of acetic acid, shake and filter; the filtrate complies with the Tests for identification (1) described under Fenoprofen Calcium.

(2) The light absorption of a solution obtained in the Assay exhibits maxima at 272 nm and 278 nm with a shoulder peak at 266 nm. (Appendix IV A).

Other requirements Comply with the general requirements for tablets. (Appendix I A).

Assay Weigh and powder 20 tablets. To a quantity of the powdered tablets equivalent to about 0.2 g of Fenoprofen calcium in a 200 ml volumetric flask add 5 ml of glacial acetic acid, shake for 1 minute then add 100 ml of methanol and shake for 5 minutes, dilute with methanol to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with methanol to volume and mix well. Measure the absorbance of the resulting solution at 272 nm (Appendix IV A), taking 80.7 as the value of A (1%, 1 cm), calculate the content of $C_{15}H_{14}O_3$.

Category As described under Fenoprofen Calcium.

Strength 0.3 g (calculated on the basis of $C_{15}H_{14}O_3$)

Storage Preserve in tightly closed containers.

Fentanyl Citrate

$C_{22}H_{28}N_2O \cdot C_6H_8O_7$ 528.60 [990-73-8]

Fentanyl Citrate is *N*-(1-phenethyl-4-piperidyl)-propionanilide citrate (1:1). It contains not less than 98.0% of $C_{22}H_{28}N_2O \cdot C_6H_8O_7$, calculated on the dried basis.

Description A white crystalline powder; taste, bitter; an aqueous solution yields acid reaction. Freely soluble in hot isopropanol; soluble in methanol; sparingly soluble in water or chloroform.

Melting point 148-151°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 10 ml of trinitrophenol TS with stirring, a precipitate is produced. Filter and wash the precipitate with small portions of water and dry at 105°C. The melting point of the residue is 173-176°C (Appendix VI C).

(2) The infra-red absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fentanyl citrate

(Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of citrates (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Heavy metals Mix 1.0 g with 2 ml of sodium acetate BS (pH 3.5) and add water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.5 g, accurately weighed, in 15 ml of glacial acetic acid, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 52.86 mg of $C_{22}H_{28}N_2O \cdot C_6H_8O_7$.

Category Analgesic.

Storage Preserve in tightly closed containers.

Preparation Fentanyl Citrate Injection

Fentanyl Citrate Injection

Fentanyl Citrate Injection is a sterile solution of fentanyl citrate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of fentanyl ($C_{22}H_{28}N_2O$).

Description A clear, colourless liquid.

Identification (1) The light absorption of the injection exhibits a maximum at 256 nm (Appendix IV A).

(2) Evaporate 20 ml of the injection to about 10 ml, it yields the reaction characteristic of citrates (Appendix III).

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded with silica gel and a mixture of (_____) 400 _____ r. 200 _____ glacial acetic acid 0.6 ml, mix well)-0.2% of anhydrous sodium sulfate in ammonium acetate solution (1→100) (7:3) and adjust to pH 6.5 ± 0.1 with glacial acetic acid as the mobile phase. Detection wavelength is 230 nm and the number of theoretical plates of the column is not less than 2400, calculated with reference to the peak area of fentanyl citrate.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in water to produce a solution of 50 µg per ml, inject 20 µl, accurately measured, into the column and record the chromatogram. Repeat the operation, using the fentanyl citrate CRS instead of the substance being examined, calculate the content of $C_{22}H_{28}N_2O$ with respect to the peak area by the external standard method.

Category As described under Fentanyl Citrate.

Strength 2 ml : 0.1 mg

Storage Preserve in well closed containers, protected from light.

Ferrous Fumarate

$C_4H_2FeO_4$ 169.90

[141-01-5]

Ferrous Fumarate is iron (2+)(E)-2-fumarate. It contains not less than 93.0% of $C_4H_2FeO_4$, calculated on the dried basis.

Description An orange-red or reddish-brown powder; odourless.

Practically insoluble in water or ethanol.

Identification (1) To 50 mg add 100 mg of resorcinol in an evaporating dish, mix well, add 3-5 drops of sulfuric acid and heat gently. Until a deep red semi-solid mass is produced, cool, dilute with 25 ml of water and filter. To 1 ml of filtrate add 10 ml of water, and mix well. An orange-red solution with green fluorescence is produced, which turns to red with fluorescence after made alkaline with a few drops of sodium hydroxide TS.

(2) Heat about 2 g with 100 ml of hydrochloric acid solution (1→8) to dissolve, cool and filter, wash the precipitate three times with 5 ml each of hydrochloric acid solution (1→100), then wash the precipitate with water until the filtrate shows no yellow colour and dry the precipitate at 105°C. Dissolve 0.1 g of the precipitate in 2 ml of sodium carbonate TS, add a few drops of potassium permanganate TS, a dark brown colour is produced.

(3) Dissolve a quantity of the above precipitate in water to produce a solution of about 5 µg per ml. The light absorption of the solution exhibits a maximum at 206 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ferrous fumarate (Appendix XVI).

(5) The filtrate obtained under test (2) yields the reactions characteristic of ferrous salt (Appendix III).

Sulfate To 0.30 g add 4 ml of dilute hydrochloric acid, heat to dissolve, add 25 ml of water immediately, heat to boil, cool, filter, divide the filtrate into two equal portions. To one portion of the filtrate add 5 ml of 25% barium chloride solution, mix, allow to stand for 10 minutes, filter repeatedly until the filtrate is clear. Transfer it to a 50 ml Nessler cylinder, dilute to 42 ml with water, add 3.0 ml of potassium sulfate standard solution and sufficient water to produce 50 ml, mix well and allow to stand for 10 minutes, use it as the reference solution. Transfer the other portion of the filtrate to a 50 ml Nessler cylinder, dilute to 42 ml with water, add 5 ml of 25% barium chloride solution and sufficient water to produce 50 ml, mix well and allow to stand for 10 minutes. Any opalescence produced is not more intense than that of the reference solution (0.2%).

Loss on drying When dried to constant weight at 120°C, loses not more than 1.5% of its weight (Appendix VIII L).

Ferric iron Dissolve 2 g, accurately weighed, in a mixture of 25 ml of water and 4 ml of hydrochloric acid in a 250 ml iodine flask with the aid of heat. Cool to room temperature rapidly, add 3 g of potassium iodide, insert the stopper, mix well and allow to stand in the dark for 5 minutes. Add 75 ml of water, titrate immediately with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of

titration, continue to titrate until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 5.585 mg of ferric iron. It contains not more than 2% of ferric iron.

Lead Mix 0.40 g with 3 ml of nitric acid and 5 ml of perchloric acid in a 50 ml beaker. Boil gently to dryness, cool and add 15 ml of hydrochloric acid solution (1→2). Boil gently for 1 minute, cool and transfer the solution to a separator. Extract with three portions, each of 20 ml, of ether, discard the ether extracts (the solution is to be extracted further if it is still yellow in colour). Heat the acid solution on a water bath to remove the remaining ether, cool, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add 5 drops of sodium sulfide TS and mix well. Any colour produced, is not more intense than that of a reference prepared in a similar manner using 2.0 ml of standard lead solution (0.005%).

Arsenic Mix 0.50 g with 0.5 g anhydrous sodium carbonate, add 4 ml of bromine TS and mix. Evaporate to dryness on a water bath, then ignite at 500-600°C for 2 hours. Dissolve the cooled residue in 10 ml of bromine-hydrochloric acid solution (to 1 ml of potassium bromide-bromine TS add hydrochloric acid to produce 100 ml) and 15 ml of water. Transfer the solution to a distilling flask, add 1 ml of acid stannous chloride TS and distil. Collect the distillate in a receiver containing 5 ml of water. Stop distillation when about 5 ml of liquid is left in the flask. Add sufficient water to the distillate to produce 28 ml, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0004%.

Assay Dissolve about 0.3 g, accurately weighed, in 15 ml of dilute sulfuric acid with the aid of heat. Cool, add 50 ml of freshly boiled and cooled water and 2 drops of o-phenanthroline IS, titrate immediately with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 16.99 mg of $C_4H_2FeO_4$.

Category Antianemia agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ferrous Fumarate Capsules
(2) Ferrous Fumarate Chewable Tablets
(3) Ferrous Fumarate Granules
(4) Ferrous Fumarate Tablets

Ferrous Fumarate Capsules

Ferrous Fumarate Capsules contain not less than 90.0% and not more than 105.0% of the labelled amount of ferrous fumarate ($C_4H_2FeO_4$).

Description Capsules with brown granules.

Identification Powder and dissolve a quantity of the contents in dilute hydrochloric acid, and filter. The filtrate yields the reactions characteristic of ferrous salts (Appendix III).

Ferric iron Powder the contents of 20 capsules, weigh accurately a quantity of the powder equivalent to 2 g of Ferrous Fumarate to an iodine flask, add 25 ml of water and 4 ml of hydrochloric acid to dissolve by heating, cool rapidly to room temperature, add 3 g of potassium iodide and stoppered, mix well, allow to stand in the dark for 5

minutes. Add 75 ml of water and titrate immediately with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS, towards the end of titration and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 14.3 ml of sodium thiosulfate (0.1 mol/L) VS is consumed.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Dissolve a quantity, accurately weighed, of the powdered mixed contents obtained in test for weight variation of contents, in 15 ml of dilute sulfuric acid by gentle heating. Cool, add 50 ml of water and 2 drops of *o*-phenanthroline IS, titrate immediately with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 16.99 mg of $C_4H_2FeO_4$.

Category As described under Ferrous Fumarate.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Ferrous Fumarate Chewable Tablets

Ferrous Fumarate Chewable Tablets contains not less than 90.0% and not more than 105.0% of the labelled amount of ferrous fumarate ($C_4H_2FeO_4$).

Description Grey brown to dark brown tablets; taste, sweet.

Identification Dissolve a quantity of powdered tablets equivalent to about 50 mg of ferrous fumarate with diluted hydrochloric acid. The filtrate yields the reactions characteristic of ferrous salts (Appendix III).

Ferric iron Weigh a quantity of powdered tablets equivalent to about 1 g of ferrous fumarate into an iodine flask, add 25 ml of water and 4 ml of hydrochloric acid, heat to dissolve ferrous fumarate, quickly cool to room temperature. Add 3 g of potassium iodide, insert the stopper tightly, mix well and allow to stand in dark place for 5 minutes. Add 75 ml of water, immediately titrate with sodium thiosulfate (0.1 mol/L) VS. Add 2 ml starch IS towards the end of titration. Continue to titrate until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 7.2 ml of sodium thiosulfate (0.1 mol/L) VS is consumed.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately 20 tablets and powder. Weigh accurately a quantity equivalent to about 0.3 g of ferrous fumarate, add 15 ml of diluted sulfuric acid, heat to dissolve ferrous fumarate, cool, add 50 ml of freshly boiled and cooled water and 2 drops of orthophenanthroline IS, immediately titrate with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 16.99 mg $C_4H_2FeO_4$.

Category As described under ferrous fumarate.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers and protected from light.

Ferrous Fumarate Granules

Ferrous Fumarate Granules contains not less than 90.0% and not more than 105.0% of the labelled amount of ferrous fumarate ($C_4H_2FeO_4$).

Description Grey brown to dark brown granules; odour, fragrant; taste, sweet.

Identification (1) Weigh a quantity of powdered granules equivalent to about 2 g of ferrous fumarate, add 100 ml of hydrochloric acid solution (1→8), heat to boil. Cool, filter and keep the filtrate. Wash the residue with several portions of hydrochloric acid solution (1→100), each of 5 ml. Continue to wash with water until the filtrate clear. Dissolve 0.1 g with 2 ml of sodium carbonate solution after dried at 105°C, add several drops of potassium permanganate TS, a brown colour is produced immediately.

(2) The filtrate obtained in identification (1) yields the reactions characteristic of ferrous salts (Appendix III).

Ferric iron Weigh a quantity of powdered granules equivalent to about 2 g of ferrous fumarate into an iodine flask, add 25 ml of water and 4 ml of hydrochloric acid, heat to dissolve ferrous fumarate, quickly cool to room temperature. Add 3 g of potassium iodide, insert the stopper tightly, mix well and allow to stand in dark place for 5 minutes. Add 75 ml of water, immediately titrate with sodium thiosulfate (0.1 mol/L) VS. Add 2 ml starch IS towards the end of titration. Continue to titrate until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 14.3 ml of sodium thiosulfate (0.1 mol/L) VS is consumed.

Other requirements Except Solubility Test, comply with the general requirements for Granules (Appendix I N).

Assay Weigh accurately a quantity of the mixed powdered contents obtained in the Test for Weight Variation of Contents, equivalent to about 0.3 g of ferrous fumarate, add 15 ml of diluted sulfuric acid, heat to dissolve ferrous fumarate, cool, add 50 ml of freshly boiled and cooled water and 2 drops of orthophenanthroline IS, immediately titrate with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 16.99 mg $C_4H_2FeO_4$.

Category As described under ferrous fumarate.

Strength (1) 1 g±0.1 g (2) 2 g±0.2 g

Storage Preserve in tightly closed containers and protected from light.

Ferrous Fumarate Tablets

Ferrous Fumarate Tablets contain not less than 90.0% and not more than 105.0% of the labelled amount of ferrous fumarate ($C_4H_2FeO_4$).

Description Sugar-coated tablets with reddish-brown core.

Identification Powder the tablets with sugar coating removed. Dissolve the powdered tablets in dilute hydrochloric acid and filter; the filtrate yields the reactions characteristic of ferrous salts (Appendix III).

Ferric iron Powder 10 tablets with sugar coating removed. Dissolve the powdered tablets in 25 ml of water and 4 ml of

hydrochloric acid in an iodine flask with the aid of heat. Cool immediately to room temperature, add 3 g of potassium iodide, insert the stopper, mix and allow to stand in dark for 5 minutes. Add 75 ml of water and titrate immediately with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration, then continue to titrate until the blue colour disappears. Perform a blank determination and make any necessary correction. Not more than 14.3 ml (strength 0.2 g), 7.2 ml (strength 0.1 g) or 3.6 ml (strength 0.05 g) of sodium thiosulfate (0.1 mol/L) VS is consumed.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with sugar coating removed. Dissolve a quantity of the powdered tablets equivalent to about 0.3 g of ferrous fumarate, accurately weighed, in 15 ml of dilute sulfuric acid by heating. Cool, add 50 ml of freshly boiled and cooled water and 2 drops of o-phenanthroline IS, titrate immediately with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 16.99 mg of $C_6H_8FeO_4$.

Category As described under Ferrous Fumarate.

Strength (1) 0.05 g (2) 0.1 g (3) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Ferrous Gluconate

$C_{12}H_{22}FeO_{14} \cdot 2H_2O$ 482.17

[299-29-6]

Ferrous Gluconate is the ferrous salts of D-gluconic acid, dihydrate. It contains not less than 97.0% and not more than 102.0% of $C_{12}H_{22}FeO_{14}$, calculated on the dried basis.

Description A greenish grey or pale yellow powder or granules; odour of caramel; taste, astringent. Freely soluble in hot water; soluble in water; practically insoluble in ethanol.

Identification (1) Dissolve about 0.5 g in 5 ml of water by warming, add 0.7 ml of glacial acetic acid and 1 ml of freshly distilled phenylhydrazine, heat on a water bath for 20 minutes and cool. Scratch the inner surface of the test tube with a glass rod; yellow crystals are produced gradually. (2) Dissolve 0.1 g in 20 ml of water, add potassium ferricyanide TS; a dark blue precipitate is produced.

Acidity Dissolve 1.0 g in 20 ml of water, pH 3.7-6.0 (Appendix VI H).

Clarity and Colour of solution A solution of 0.50 g in 10 ml of cold water freshly boiled is clear, with slightly greenish brown colour.

Chloride Carry out the limit test for chlorides (Appendix III A), using 50 mg. Any opalescence produced is not more intense than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.06%).

Sulfate To 1 ml of 5% ferrous gluconate solution add 3 ml of 3 mol/L acetic acid solution and dilute with water to 15

ml. Carry out the limit test for sulfate (Appendix VIII B), any opalescence produced is not more intense than that of a reference solution, using 1.0 ml of potassium sulfate standard solution (0.2%).

Barium Dissolve 1.0 g in 100 ml of water, filter. Divide the filtrate into two equal portions. To one portion add 5 ml of dilute sulfuric acid; to the other portion add 5 ml of water, allow to stand for 5 minutes. The solutions are equal in clarity.

Calcium Dissolve 2.0 g in 100 ml of water, divide the solution into two equal portions. To one portion add 5 ml of ammonium oxalate TS; to the other portion add 5 ml of water, allow to stand for 5 minutes. The solutions are equal in clarity.

Oxalates Dissolve 5.0 g in the mixture of 10 ml of (6 mol/L) sulfuric acid solution and 40 ml of water, add 50 ml of ether, shake for 5 minutes, separate the water layer, add 20 ml of ether again, shake for 20 minutes. Combine the ether extracts, evaporate to dryness, dissolve the residue with 15 ml of water and filter. Concentrate the filtrate to 5 ml, add 1 ml of acetic acid solution (1 mol/L) and 1 ml of 10% calcium chloride solution; no turbidity is produced within 30 minutes.

Ferric Iron Dissolve 5.0 g, accurately weighed, in a 250 ml of iodine flask with 100 ml of water and 10 ml of hydrochloric acid, add 3 g of potassium iodide, insert the stopper, mix well, allow to stand in the dark for 5 minutes and titrate with sodium thiosulfate (0.1 mol/L) VS, adding 0.5 ml of starch IS towards the end of titration. Continue to titrate until the blue colour disappears. Perform a blank determine and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 5.585 mg of Fe. It contains not more than 1.0% of ferric iron.

Loss on drying When dried to constant weight at 100-105°C for 5 hours, loses not less than 7.0% and not more than 10.5% of its weight (Appendix VIII L).

Heavy metals To a 50 ml Nessler cylinder A. Add sufficient water, 2 ml of dilute acetic acid, 1 g of ascorbic acid, and a few drops of dilute caramel solution to adjust the colour matched with the test preparation, then add 1.25 ml of standard lead solution, dilute with water to 25 ml as the reference solution. To another Nessler cylinder B add 5 ml of a solution of 0.5 g in 20 ml of water, then add 2 ml of dilute acetic acid, 1 g of ascorbic acid and 1 ml of standard lead solution and sufficient water to 25 ml as the test solution. To each cylinder add 10 ml of hydrogen sulfide TS and mix well, allow to stand in the dark for 10 minutes. Compare the colour produced by viewing down the vertical axis of the cylinder against a white background. The colour produced in cylinder B is not more intense than that produced in cylinder A. It contains not more than 0.002% of heavy metals.

Arsenic Dissolve 0.5 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for Arsenic (Appendix VIII J, method 1); not more than 0.0004%.

Assay Dissolve about 1.5 g, accurately weighed, in a conical flask with stopper, with 75 ml of water and 15 ml of 1 mol/L sulfuric acid solution. Add 0.75 g of zinc powder, insert the stopper, allow to stand for about 20 minutes until the colour of solution disappears, filter the solution through NO. 4 sintered glass filter spread with zinc powder. Remove the precipitate, wash the filter with 20 ml of freshly boiled and cooled water. Combine the filtrate and washings, add 0.2 ml of o-phenanthroline IS, titrate with ceric sulfate (0.1 mol/L) VS until the colour of solution turns from

orange yellow to green. Perform a blank determine and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 44.61 mg of $C_{12}H_{22}FeO_{14}$.

Category Antianemia.

Storage Preserve in tightly closed container.

Preparation (1) Ferrous Gluconate capsules
(2) Ferrous Gluconate syrup
(3) Ferrous Gluconate tablets

Ferrous Gluconate Capsules

Ferrous Gluconate Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of Ferrous Gluconate ($C_{12}H_{22}FeO_{14} \cdot 2H_2O$).

Identification The contents of capsules comply with the tests for Identification (1) (2) described under Ferrous Gluconate.

Loss on drying When dried about 1 g of the contents of capsules at 105°C for 5 hours, loses not more than 11.0% of its weight. (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test of weight variation, equivalent to about 1.5 g of ferrous gluconate, carry out the Assay described under Ferrous Gluconate. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 48.22 mg of $C_{12}H_{22}FeO_{14} \cdot 2H_2O$.

Category As described under Ferrous Gluconate.

Strength (1) 0.25 g (2) 0.3 g (3) 0.4 g

Storage Preserve in tightly closed containers.

Ferrous Gluconate Syrup

Ferrous Gluconate Syrup contains not less than 92.0% and not more than 110.0% of the labelled amount of ferrous gluconate ($C_{12}H_{22}FeO_{14} \cdot 2H_2O$).

Description A clear, pale yellowish-brown dense liquid; odour, fragrant of flavours; taste, sour and sweet.

Identification To 0.5 ml add 5 ml of water, the solution yields the reactions characteristic of Ferrous salts (Appendix III).

pH value 3.5-4.5 (Appendix IV H).

Clarity of solution To 10 ml add 50 ml of water, mix well, the solution is clear.

Relative density Not less than 1.25 (Appendix IV A).

Other requirements Complies with the general requirements for syrups (Appendix I K).

Assay Transfer 25 ml, accurately measured, into a conical flask with stopper, add 75 ml of water and 15 ml of dilute sulfuric acid; mix well. Add 0.38 g of zinc powder, allow to stand for 20 minutes, filter with No. 4 sintered glass filter spread with zinc powder, wash the filter with 20 ml of water. Combine the filtrate and washings, add 4 drops of α -phenanthroline IS. Titrate with ceric sulfate (0.1 mol/L) VS until the colour turns from orange-yellow to green.

Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 48.22 mg of $C_{12}H_{22}FeO_{14} \cdot 2H_2O$.

Category As described under Ferrous Gluconate.

Strength (1) 10 ml: 0.25 g (2) 10 ml: 0.30 g

Storage Preserve in tightly closed containers, protected from light.

Ferrous Gluconate Tablets

Ferrous Gluconate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of ferrous gluconate ($C_{12}H_{22}FeO_{14} \cdot 2H_2O$).

Description Sugar coated tablets, with a greyish-green or pale yellow core.

Identification The powdered tablets comply with tests for Identification (1) (2) described under Ferrous Gluconate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 40 tablets (for 0.1 g strength) and 20 tablets (for 0.3 g strength) with sugar coating removed. Dissolve a quantity of the powder equivalent to about 1.5 g of ferrous gluconate, accurately weighed, in a conical flask with a stopper in a mixture of 75 ml of water and 15 ml of 1 mol/L sulfuric acid solution. Add 0.75 g of zinc powder, insert the stopper, allow to stand for 20 minutes until the colour of solution disappears. Filter with No. 4 sintered glass filter spread with zinc powder. Remove the precipitate and wash the filter with 20 ml of freshly boiled and cooled water. Combine the filtrate and washings, add 0.2 ml of α -phenanthroline IS, titrate with ceric sulfate (0.1 mol/L) VS until the colour turns from orange-yellow to green. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 48.22 mg of $C_{12}H_{22}FeO_{14} \cdot 2H_2O$.

Category As described under Ferrous Gluconate.

Strength (1) 0.1 g (2) 0.3 g

Storage Preserve in tightly closed containers, protected from light, stored in dry place.

Ferrous Sulfate

$FeSO_4 \cdot 7H_2O$ 278.01 [7782-63-0]

Ferrous Sulfate contains not less than 98.5% and not more than 104.0% of $FeSO_4 \cdot 7H_2O$.

Description Pale bluish-green prismatic crystals or granules; odourless; taste, salty and astringent; effloresce in dry air and rapidly oxidized in damp air forming yellowish-brown basic ferric sulfate on the surface. Soluble in water; insoluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of ferrous salts and sulfates (Appendix III).

Acidity Dissolve 0.50 g in 10 ml of water, pH 3.0-4.0 (Appendix VI H).

Basic sulfate Dissolve 1.0 g in 2 ml of freshly boiled and cooled water, the solution is clear.

Heavy metals Dissolve 1.0 g in 10 ml of 7 mol/L

hydrochloric acid solution, add 2 ml of 30% hydrogen peroxide, evaporate to about 5 ml on a water bath, cool and transfer to a separator, wash the vessel with 10 ml of 7 mol/L hydrochloric acid in portions, and combine the washings to the same separator. Extract with three portions, each of 20 ml, of methyl isobutyl ketone (add 1 ml of 7 mol/L hydrochloric acid to 100 ml of methyl isobutyl ketone distilled freshly). Heat the water layer on a water bath for 20 minutes, cool, add 1 drop of phenolphthalein IS. Add dropwise concentrate ammonia solution until the solution turns to pale red, then add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic Dissolve 1.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.5 g, accurately weighed, in 15 ml of dilute sulfuric acid and 15 ml of freshly boiled and cooled water, titrate immediately with potassium permanganate (0.02 mol/L) VS until the solution is persistently pink. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 27.80 mg of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Category Anti-anemia agent.

Storage Preserve in tightly closed containers.

Preparation (1) Ferrous Sulfate Sustained-release Tablets
(2) Ferrous Sulfate Tablets

Ferrous Sulfate Sustained-release Tablets

Ferrous Sulfate Sustained Release Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of ferrous sulfate ($\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$).

Description Film coated Tablets with pale bluish green core.

Identification Powder the tablets after removing the film coating. Shake a quantity of the powdered tablets equivalent to 0.2 g of ferrous sulfate with a drop of dilute hydrochloric acid and 20 ml of water, filter. The filtrate yields the reactions characteristic of ferrous salts and sulfates (Appendix III).

Drug release Carry out drug release test (Appendix X D, method 1), using the apparatus described under Dissolution test (Appendix X C, method 1) and 900 ml of 0.1 mol/L hydrochloric acid solution as the release medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 2 and 6 hours respectively and filter (Add 10 ml of the release medium to vessel to compensate the volume immediately). Measure accurately 5 ml of the successive filtrate into a 50 ml volumetric flask, dilute with water to volume. Carry out the method for atomic absorption spectrophotometry (Appendix IV D, method 1), measure directly the content of ferrous in the solution, calculate the drug release of ferrous sulfate from each tablet at 2 and 6 hours, respectively. The drug release of ferrous sulfate complies with the requirement: the quantity released from each tablet is 20%-40% and 50%-75% of the labelled amount at 2 and 6 hours respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay To 3 tablets with film coating removed add 30 ml of dilute sulfuric acid and a quantity of freshly boiled and cooled water in a 200 ml of volumetric flask, shake to dissolve ferrous sulfate. Add freshly boiled and cooled water to volume, mix well. Filter quickly through a piece of dry filter paper. Measure accurately 50 ml of the successive filtrate, add a few drops of *o*-phenanthroline IS, titrate with ceric sulfate (0.1 mol/L) VS immediately. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 27.80 mg of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Category As described under Ferrous Sulfate.

Strength 0.45 g

Storage Preserve in tightly closed containers, stored in a dry place.

Ferrous Sulfate Tablets

Ferrous Sulfate Tablets contain not less than 95.0% and not more than 110.0% of the labelled amount of ferrous sulfate ($\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$).

Description Sugar-coated tablets with pale bluish-green core.

Identification Powder the tablets with sugar coating removed. Weigh accurately a quantity equivalent to about 0.2 g of ferrous sulfate, shake with 1 drop of dilute hydrochloric acid and 20 ml of water to dissolve ferrous sulfate, filter. The filtrate yields the reactions characteristic of ferrous salts and sulfates (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay To 10 tablets in a 200 ml volumetric flask add 60 ml of dilute sulfuric acid and a quantity of freshly boiled and cooled water, shake to dissolve ferrous sulfate. Add freshly boiled and cooled water to volume, shake well, filter quickly with dry filter paper. Measure accurately 30 ml of the successive filtrate, add a few drops of *o*-phenanthroline IS, titrate immediately with ceric sulfate (0.1 mol/L) VS. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 27.80 mg of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$.

Category As described under Ferrous Sulfate.

Strength 0.3 g

Storage Preserve in tightly closed containers, stored in a dry place.

Fleroxacin

$\text{C}_{17}\text{H}_{18}\text{F}_3\text{N}_3\text{O}_3$ 369.34

Fleroxacin is 6,8-Difluoro-1-(2-fluoroethyl)-1,4-dihydro-7-(4-methyl-1-piperazinyl)-4-oxo-3-quinoline carboxylic acid. It contains not less than

98.5% and not more than 102.0% of $C_{17}H_{18}F_3N_3O_3$, calculated on the dried basis.

Description A white or slight yellow crystalline powder; odourless; taste, bitter.

Slightly soluble in chloroform; very slightly soluble in water or methanol; practically insoluble in acetic ether; freely soluble in glacial acetic acid; sparingly soluble in sodium hydroxide TS.

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-ammonia solution (15 : 10 : 2) as mobile phase. Apply separately to the plate 10 μ l each of two solutions in a mixture of chloroform-methanol (4 : 1) containing (1) 1 mg per ml of the substance being examined and (2) 1 mg per ml of fleroxacin CRS. After developing and removal of the plate, dry in air, examine under UV (254 nm). The fluorescence and position of the four principal spots in the chromatogram obtained with solution (1) correspond to that of the principal spots obtained with solution (2).

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of fleroxacin CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fleroxacin (Appendix X VI).

Test (1) or (2) may be used alternatively.

Clarity and colour of solution Dissolve 5 portions each of 0.5 g with 10 ml of sodium dioxide TS, the solutions are clear. Any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B). Any colour produced (for injection) is not more intense than that of reference solution Y₅ or YG₅ (Appendix IX A, method 1).

Related substances Carry out the method described under Assay. Dissolve a quantity of the substance being examined, in the mobile phase to produce solutions of 2.0 mg per ml (solution 1) and 20 μ g per ml (solution 2). Inject 20 μ l of the solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% to 25% of the full scale of the chart. Inject 20 μ l of the above two solutions into the column and record the chromatogram for two times the retention time of the principal peak. The sum of all secondary peak areas in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g in a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of triethylamine phosphate solution (add 5 ml of triethylamine and 7 ml of phosphoric acid to water, and dilute to a volume of 1000 ml)-acetonitrile (82 : 18) as the mobile phase. Detection wavelength is 286 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of fleroxacin. The resolution factor between the peak of fleroxacin and adjacent peaks is not less than 1.5.

Procedure Dissolve about 100 mg, accurately weighed, in

the mobile phase and dilute to 100 ml, mix well. Measure accurately 5 ml of the above solution to a 100 ml volumetric flask, dilute with the mobile phase and mix well. Inject 10 μ l of the solution into the column. Repeat the operation, using fleroxacin CRS instead of the substance being examined, calculate the content of $C_{17}H_{18}F_3N_3O_3$.

Category Quinolone antibiotic.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Fleroxacin Tablets
(2) Fleroxacin Capsules

Fleroxacin Capsules

Fleroxacin capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of fleroxacin ($C_{17}H_{18}F_3N_3O_3$).

Description Capsules containing white or slight yellow granule or powder.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of fleroxacin CRS.

(2) Dissolve a quantity of the content of the capsules in 0.1 mol/L hydrochloric acid to produce a solution of 6 μ g of fleroxacin per ml, filter. The light absorption of the filtrate exhibits maxima at 286 nm and 320 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloride acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 r/min. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with hydrochloride acid solution (9→1000) to produce a solution of 4 μ g of fleroxacin per ml. Dissolve a quantity of fleroxacin CRS in hydrochloride acid solution (9→1000) to produce a solution of 4 μ g per ml. Measure the absorbance of the resulting solutions at 286 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{18}F_3N_3O_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Transfer an accurately weighed quantity of the mixed contents of capsules obtained in the test for Weight variation of contents, equivalent to about 100 mg of fleroxacin to a 100 ml volumetric flask, add a quantity of mobile phase to dissolve, and dilute to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix thoroughly. Inject 10 μ l to the column and proceed as described under Fleroxacin.

Category As described under Fleroxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Fleroxacin Tablets

Fleroxacin Tablets contain not less than 90.0%

and not more than 110.0% of the labeled amount of fleroxacin ($C_{17}H_{18}F_3N_3O_3$).

Description White or slight yellow tablets or film coated tablets with white or slight yellow core.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of fleroxacin CRS.

(2) Dissolve a quantity of the powdered tablets in 0.1 mol/L hydrochloric acid to produce a solution of 6 μ g of fleroxacin per ml, filter. The light absorption of the filtrate exhibits maxima at 286 nm and 320 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloride acid solution (9 \rightarrow 1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with hydrochloride acid solution (9 \rightarrow 1000) to produce a solution of 4 μ g of fleroxacin per ml. Dissolve a quantity of fleroxacin CRS in hydrochloride acid solution (9 \rightarrow 1000) to produce a solution of 4 μ g per ml. Measure the absorbance of the resulting solutions at 286 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{18}F_3N_3O_3$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of powder equivalent to about 100 mg of fleroxacin with mobile phase and dilute to 100 ml, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix thoroughly. Inject 10 μ l to the column and proceed as described under Fleroxacin.

Category As described under Fleroxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Fluconazole

$C_{13}H_{12}F_2N_6O$ 306.28

[86386-73-4]

Fluconazole is 2-(2,4-difluorophenyl)-1,3-bis (1H-1,2,4-triazol-1-yl) propan-2-ol. It contains not less than 98.5% of $C_{13}H_{12}F_2N_6O$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless or slightly characteristic odour; taste, bitter.

Freely soluble in methanol; soluble in ethanol; slightly soluble in dichloromethane, water or acetic acid; insoluble in ether.

Melting range 137-141°C (Appendix VI C).

Identification (1) The light absorption of the solution of 200 μ g per ml in ethanol exhibits maxima at 261 nm and 267 nm, and a minimum at 264 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of fluconazole (Appendix XVI).

(3) Yields the reaction characteristic of organic fluorinated compounds (Appendix III).

Clarity of solution Dissolve 20 mg in 10 ml of water, the solution is clear; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B) (for injection).

Fluorine Weigh accurately about 15 mg and carry out the method for determination of fluorine (Appendix VIII E). It contains not less than 11.1% and not more than 12.4% of fluorine.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (pH 7.0)-methanol (55:45) as the mobile phase. Detection Wavelength is 260 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of fluconazole. Dissolve a quantity of the substance being examined with the mobile phase to produce a solution of about 1 mg per ml as the test solution (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask, dilute by mobile phase to the volume, mix well as the reference solution (2). Inject 10 μ l of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Inject separately accurately 20 μ l each of the solution (1) and (2) into the column and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram of solution (1) is not greater than the area of the principal peak of solution (2).

Chloride Weigh accurately about 20 mg, carry out the method for oxygen flask combustion, using 20 ml of 0.4% sodium hydroxide solution as the absorbing liquid. When the combustion is complete, shake vigorously for 5 minutes, add 10 ml of dilute nitric acid, transfer the solution to a 50 ml Nessler cylinder. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner, using 6.0 ml of sodium chloride standard solution instead of the substance being examined (0.3%).

Loss on drying When dried to constant weight at 105°C, % loss is not more than 0.5% (Appendix VIII D).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.1 g, accurately weighed, in 50 ml of glacial acetic acid, carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 15.31 mg of $C_{13}H_{12}F_2N_6O$.

Category Antifungal.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Fluconazole Capsules
(2) Fluconazole and sodium chloride Injection
(3) Fluconazole Tablets

Fluconazole and Sodium Chloride Injection

Fluconazole and sodium chloride Injection is a sterile isotonic solution of fluconazole in Water for Injection containing sodium chloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of fluconazole ($C_{13}H_{12}F_2N_6O$) and sodium chloride (NaCl).

Description A clear, colourless solution.

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of acetone-dichloromethane (70:30) as the mobile phase. Apply separately to the plate 20 μ l each of the injection and a reference solution containing 2 mg of fluconazole CRS per ml in 0.9% sodium chloride solution. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The light absorption of the solution obtained in the Assay exhibits two maxima at 261 nm and 267 nm, and a minimum at 264 nm (Appendix IV A).

(3) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

Acidity 4.0-6.0 (Appendix VI H).

Heavy metals Evaporate 50 ml of injection to 20 ml and cool, add 2 ml of acetate BS (pH 3.5) and a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00003%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H), using the injection treated by membrane filtration method.

Other requirements Complies with the general requirements for injection (Appendix I B).

Fluconazole Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (pH 7.0)-methanol (55:45) as the mobile phase. Detectable Wavelength is 260 nm. The number of theoretical plates of the column, calculated with respect to the peak of fluconazole, is not less than 2000.

Procedure Measure accurately a quantity of the substance being examined and dilute with mobile phase to produce a solution of about 0.5 mg of fluconazole per ml as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of fluconazole CRS, accurately weighed, and dilute with mobile phase to produce a solution of about 0.5 mg per ml, repeat the operations, calculate the content of $C_{13}H_{12}F_2N_6O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Sodium Chloride Measure accurately 10 ml of the substance being examined, add 40 ml of water, 5 ml of 2% dextrin solution and 5-8 drops of fluorescein IS and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Fluconazole.

Strength (1) 50 ml : fluconazole 0.1 g and sodium chloride

0.45 g

(2) 100 ml : fluconazole 0.1 g and sodium chloride 0.9 g

(3) 100 ml : fluconazole 0.2 g and sodium chloride 0.9 g

Storage Preserve in well closed containers, protected from light.

Fluconazole Capsules

Fluconazole Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of fluconazole ($C_{13}H_{12}F_2N_6O$).

Description Capsules containing white or almost white powder.

Identification (1) To a quantity equivalent to about 0.1 g of fluconazole, add 10 ml of methanol, shake thoroughly to dissolve fluconazole and filter, using the filtrate as solution (1). Dissolve 0.1 g of fluconazole CRS in 10 ml of methanol as solution (2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of dichloromethane-methanol-concentrated ammonia solution (80:20:1) as the mobile phase. Apply separately to the plate 10 μ l of each of the solutions. After developing and removal of the plate, dry in air and examine under ultra-violet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to the principal spot obtained with solution (2).

(2) The light absorption of the solution obtained in the Assay exhibits two maxima at 261 nm and 267 nm, and a minimum at 264 nm.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml (for strength 50 mg) or 1000 ml (for strength 0.1 g, 0.15 g) of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes, filter and discard the initial filtrate, using the successive filtrate as the test solution. Dissolve an accurately weighed quantity of fluconazole CRS in the dissolution medium to produce a solution of about 0.1 mg per ml. Measure the absorbance of the resulting solutions at 261 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_{12}F_2N_6O$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I D).

Assay Triturate and weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 50 mg of fluconazole, to a 100 ml volumetric flask, add a quantity of hydrochloric acid solution (9 → 1000), shake thoroughly to dissolve fluconazole, dilute to volume, mix well and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, dilute with the above solvent to volume, mix well. Dissolve an accurately weighed quantity of fluconazole CRS, in hydrochloric acid solution (1→1000) to produce a solution of about 0.2 mg per ml, mix well. Measure the absorbance of the resulting solutions at 261 nm (Appendix IV A) and calculate the content of $C_{13}H_{12}F_2N_6O$.

Category As described under Fluconazole.

Strength (1) 50 mg (2) 0.1 g (3) 0.15 g

Storage Preserve in tightly closed containers, stored in a

dry place.

Fluconazole Tablets

Fluconazole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of fluconazole ($C_{13}H_{12}F_2N_6O$).

Description White or almost white tablets or film coated tablets with white or almost white core.

Identification (1) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of fluconazole CRS.

(2) Dissolve a quantity of the powdered tablets in ethanol to produce a solution of 0.2 mg of fluconazole per ml and filter. The light absorption of the filtrate exhibits two maxima at 261 nm and 267 nm, and a minimum at 264 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml (for strength 50 mg) or 1000 ml (for strength 0.1 g, 0.15 g) of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes, filter and discard the initial filtrate, using the successive filtrate as the test solution. Dissolve an accurately weighed quantity of fluconazole CRS in the above solvent to produce a solution of about 0.1 mg per ml. Measure the absorbance of the resulting solutions at 261 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_{12}F_2N_6O$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (pH 7.0)-methanol (55 : 45) as the mobile phase. Detection wavelength is 261 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of fluconazole.

Procedure Weighed accurately and powder 10 tablets. Dissolve an accurately weighed quantity (equivalent to about 50 mg of fluconazole) with the mobile phase in a 100 ml volumetric flask and dilute to volume, mix well, filter. Inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity of fluconazole CRS in the mobile phase to produce a reference solution of 0.5 mg of fluconazole CRS per ml. Repeat the operation and calculate the content of fluconazole with respect to the peak area obtained in the chromatogram by the external standard method.

Category as described under Fluconazole.

Strength (1) 50 mg (2) 0.1 g (3) 0.15 g

Storage Preserve in tightly closed containers, protected from light.

Flucytosine

$C_4H_4FN_3O$ 129.09

[2022-85-7]

Flucytosine is 5-fluoropyrimidin-4-amino-2(1H)-one. It contains not less than 98.5% of $C_4H_4FN_3O$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or odour slightly.

Sparingly soluble in water; slightly soluble in absolute ethanol; practically insoluble in chloroform or ether; freely soluble in dilute hydrochloric acid TS or dilute sodium hydroxide TS.

Identification (1) To 5 ml of aqueous solution (1→100) add 0.15 of bromine TS and shake, the colour is discharged. (2) The light absorption of a solution of about 10 μ g per ml in hydrochloric acid (9→100) exhibits a maximum at 286 nm; the absorbance is about 0.71 (Appendix IV A). (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of flucytosine (Appendix XVI).

Fluorouracil Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and chloroform-glacial acetic acid (13 : 7) as the mobile phase. Apply separately to the plate 20 μ l each of two solutions in a mixture of glacial acetic acid-water (8 : 2) containing (1) 50 μ g per ml of fluorouracil CRS, (2) 25 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, and examine under ultraviolet light (254 nm). The fluorescence of the secondary spot in the chromatography obtained with solution (2) is not more intense than that of the principal spot obtained with solution (1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Assay Dissolve about 0.1 g, accurately weighed, in 20 ml of glacial acetic acid, add 10 ml of acetic anhydride, heat slightly, cool. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.91 mg of $C_4H_4FN_3O$.

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light.

Preparation Flucytosine Injection

Flucytosine Injection

Flucytosine Injection is a sterile and isotonic solution of flucytosine in Water for Injection containing a quantity of sodium chloride. It contains not less than 93.0% and not more than 107.0% of the labelled amount of flucytosine ($C_4H_4FN_3O$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Rotate the test tube containing about 1-2 ml of saturated solution of potassium dichromate in sulfuric acid, the solution is spread evenly on the wall; add 1 drop of the substance being examined and heat gently, the solution can no longer be spread evenly on the wall, but attached to it with greasy substance.

(2) To 5 ml add a few drops of bromine TS, perform a blank test at the same time, the colour of bromine in the test solution is discharged or obviously faint than that in the blank.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 286 nm and a minimum at 245 nm (Appendix IV A).

pH value 6.0-8.0 (Appendix VI H).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-glacial acetic acid (13:7) as the mobile phase. Apply separately to the plate 20 μ l each of the substance being examined and a reference solution of 0.1 mg per ml of flucytosine CRS in a mixture of methanol-water (2:1). After developing and removal of the plate, dry in air, examine under ultra-violet light (254 nm). The fluorescence of any secondary spot in the chromatography obtained with the substance being examined is not more intense than that of the principal spot obtained with the reference solution (1.0%).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of rabbit's weight.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Dilute an accurately measured quantity with 0.1 mol/L hydrochloric acid solution to produce a solution of 5 μ g per ml and measure the absorbance at 286 nm (Appendix IV A). Calculate the content of $C_4H_4FN_3O$, taking 709 as the value of A (1%, 1 cm).

Category As described under Flucytosine.

Strength 250 ml:2.5 g

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Fludrocortisone Acetate

$C_{23}H_{31}FO_6$ 422.49

[514-36-3]

Fludrocortisone Acetate is 11 β , 17 α , 21-trihydroxy-9 α -fluoro-pregna-4-ene-3,20-dione-21-acetate. It contains not less than 97.0% and not more than 102.0% of $C_{23}H_{31}FO_6$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder; odourless; tasteless; hygroscopic.

Sparingly soluble in ethanol or chloroform; slightly soluble in ether; insoluble in water.

Melting range 223-232°C, with decomposition (Appendix VI C).

Specific optical rotation +148° to +156°, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Identification (1) Dissolve about 10 mg in 1 ml of methanol by warming, add 1 ml of hot alkaline cupric tartrate TS; a red precipitate is produced.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(3) The infra-red absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fludrocortisone acetate (Appendix XVI).

(4) Yields the reaction characteristic of organic fluorine compounds (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-ether-methanol-water (385:75:40:6) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in chloroform-methanol (9:1) containing (1) 3 mg per ml, (2) 60 μ g per ml of the substance being examined. After developing and removal of the plate, dry in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. Not more than 2 secondary spots are obtained in the chromatogram of solution (1); and no secondary spot is more intense than the principal spot in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (58:42) as the mobile phase. Detection wavelength is 240 nm, and the number of theoretical plates of the column is not less than 4500, calculated with reference to the peak of fludrocortisone acetate. The resolution factor between the peaks of fludrocortisone acetate and internal standard complies with the related requirements.

Internal standard solution Dissolve hydrocortisone in mobile phase to produce a solution of 0.16 mg per ml.

Procedure Dissolve about 18 mg of fludrocortisone acetate CRS, accurately weighed, in 58 ml of methanol in a 100 ml volumetric flask, and dilute with water to volume, mix well, as the reference solution. Transfer 5 ml each of the reference solution and internal standard solution, both accurately measured, in a 50 ml volumetric flask, and dilute with mobile phase to volume, mix well, inject 20 μ l of the resulting solution into the column, record the chromatogram. Repeat the operations using about 18 mg of the substance being examined instead of fludrocortisone acetate CRS. Calculate the content of $C_{23}H_{31}FO_6$ with respect to the peak area in the chromatogram by internal standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers.

Preparation Fludrocortisone Acetate Cream

Fludrocortisone Acetate Cream

Fludrocortisone Acetate Cream contains not less than 85.0% and not more than 115.0% of the labelled amount of fludrocortisone acetate ($C_{23}H_{31}FO_6$).

Description Creamy white cream.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (60 : 40) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of fludrocortisone acetate. The resolution factor between the peaks of fludrocortisone acetate and internal standard complies with the related requirements.

Internal standard solution Dissolve dexamethasone acetate in methanol to produce a solution of about 0.30 mg per ml.

Procedure Dissolve a quantity of fludrocortisone acetate CRS, accurately weighed, in methanol to produce a solution of about 0.125 mg per ml as the reference solution. Transfer 10 ml of the reference solution and 5 ml of internal standard solution, both accurately measured, in a 50 ml volumetric flask, dilute with methanol to volume, mix well, inject 20 μ l of the resulting solution into the column and record the chromatogram. To a quantity of the substance being examined, accurately weighed, equivalent to about 1.25 mg of fludrocortisone acetate add 30 ml of methanol, heat and stir in a water bath at 80°C for 2 minutes. Cool to room temperature, add 5 ml of internal standard solution, accurately measured, dilute with methanol to 50 ml, mix well. Cool the resulting solution in an ice bath for at least 2 hours, filter quickly, discard the initial filtrate, inject 20 μ l of the successive filtrate into the column. Calculate the content of $C_{23}H_{31}FO_6$ with respect to the peak area in the chromatogram by internal standard method.

Category Corticosteroid.

Strength 10 g : 2.5 mg

Storage Preserve in tightly closed containers, stored in a cool place.

Flunarizine Hydrochloride

$C_{26}H_{26}F_2N_2 \cdot 2HCl$ 477.42

[30484-77-6]

Flunarizine Hydrochloride is (*E*)-1-[bis (4-fluorophenyl) methyl]-4-(2-propenyl-3-phenyl) piperazine dihydrochloride. It contains not less than 99.0% of $C_{26}H_{26}F_2N_2 \cdot 2HCl$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; tasteless. Sparingly soluble in methanol or ethanol; slightly soluble in chloroform; very slightly soluble in water; practically insoluble in benzene.

Melting range 204-210°C, with decomposition (Appendix VI C).

Identification (1) Shake 10 mg with 3 ml of ethanol, add 2 drops of potassium hydroxide TS and mix well, add 1 drop of potassium permanganate TS, the violet colour disappears immediately.

(2) Dissolve 6 mg in 5 ml of ethanol and 5 ml of dilute hydrochloric acid solution (24 → 1000) and mix well. Measure a quantity of the solution and dilute with the same dilute hydrochloric acid solution to produce a solution of 12 μ g per ml. The light absorption of the solution exhibits two maxima at 226 nm and 253 nm and two minima at 221 nm and 234 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of flunarizine hydrochloride (Appendix XVI).

(4) Dissolve 5 mg of flunarizine hydrochloride in 1 ml of ethanol, the solution yields the reactions characteristic of chlorides (Appendix III).

(5) Yields the reactions characteristic of organic fluorine compounds (Appendix III).

Acidity Stir 0.25 g with 20 ml of water for 5 minutes and filter, pH is 1.5-3.0 using the filtrate. (Appendix VI H).

Clarity and colour of solution Dissolve 2.5 g in a quantity of a mixture of polyethylene glycol 400-water-ethanol (5:2:3) in a 25 ml volumetric flask by ultrasonic treatment, dilute to volume and mix well. The solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); the absorbance of the solution at 400 nm (Appendix IV A) is not more than 0.07 if any colour is produced.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer solution (dissolve 1.36 g potassium dihydrogen phosphate in 1000 ml of water, add 4 ml of triethylamine, adjust the pH value with phosphoric acid to 3.5) (75:25) as the mobile phase. Detection wavelength is 253 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of flunarizine hydrochloride. The resolution factor between the peaks of flunarizine hydrochloride and adjacent peak complies with the related requirements. Dissolve the substance being examined in the mobile phase to produce a solution of 0.1 mg per ml as the test solution. Measure accurately a quantity of the test solution, and dilute with the mobile phase to produce a solution of 1 μ g per ml as the reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the height of the principal peak is not more than 20% and not less than 10% on the full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution, both accurately measured, into the column, record the chromatogram for twice the retention time of the principal peak. The sum of peak areas due to the impurities is not greater than the principal peak area in the chromatogram obtained with the reference solution.

Flucytosine Injection

Flucytosine Injection is a sterile solution of sodium salt of flucytosine in water and not more than 0.5% of sodium chloride.

Description—It is a white, crystalline powder.

It is (E)-1-[2-(2-propenyl-3-phenyl)-5-oxo-1,2,4-triazin-4-yl]-1H-imidazole-4-carboxamide hydrochloride.

dihydrogen phosphate in 1000 ml of water, add 4 ml of triethylamine, adjust the pH value with phosphoric acid to 3.5) (75:25) as the mobile phase. Detection wavelength is 253 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of flunarizine hydrochloride. The resolution factor between the peaks of flunarizine hydrochloride and adjacent peak complies with the related requirements.

Procedure Dissolve an accurately weighed quantity of the mixed contents obtained in weight variation equivalent to 10 mg of flunarizine in 100 ml volumetric flask with 10 ml of ethanol, shake well. Dilute with hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) to volume, mix well and filter. Measured accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with the same hydrochloric acid solution to volume and mix well. Inject accurately measured 20 µl of the resulting solution into the column. Dissolve an accurately weighed quantity of flunarizine hydrochloride CRS in 100 ml volumetric flask with 10 ml of ethanol, shake well, dilute with the same hydrochloric acid solution to produce a solution of 12 µg per ml. Repeat the operation, calculate the content of $C_{26}H_{26}F_2N_2$ with respect to the peak area obtained in the chromatogram by the external standard method, multiply the result by 0.8473.

Category As described under Flunarizine Hydrochloride.

Strength 5 mg (calculated as $C_{26}H_{26}F_2N_2$)

Storage Preserve in tightly closed containers, protected from light.

Preserve in tightly closed containers, protected from light.

Preparation Flunarizine Hydrochloride Capsules

Flunarizine Hydrochloride Capsules

Flunarizine Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of flunarizine hydrochloride, calculated on the basis of flunarizine ($C_{26}H_{26}F_2N_2$).

Identification (1) Dissolve a quantity of the contents equivalent to about 50 mg of flunarizine hydrochloride in 10 ml of ethanol with shaking. Filter, to 2 ml of the successive filtrate add 2 drops of potassium hydroxide TS and mix well, add 1-2 drops of potassium permanganate TS, the violet colour disappears immediately.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of flunarizine hydrochloride CRS.

(3) Measure 1 ml of the filtrate obtained in test (1) for Identification, it yields the reactions characteristic of chlorides (Appendix III).

Content uniformity Comply with the requirements for content uniformity (Appendix X E).

Transfer the content of 1 capsule to a 100 ml volumetric flask, add 5 ml of ethanol, shake well, and dilute with hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) to volume, mix well and filter. Measure accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, dilute with the same hydrochloric acid solution to volume and mix well. Proceed as described under Assay.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 600 ml of hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, use the successive filtrate as the test solution. Proceed as described under Assay. Calculate the dissolution of $C_{26}H_{26}F_2N_2$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer solution (dissolve 1.36 g potassium

Fluocinonide

$C_{26}H_{32}F_2O_7$ 494.53

[356-12-7]

Fluocinonide is 21-(acetyloxy) 6α, 9-difluoro-11β-hydroxy-16α, 17-[(1-methyl-ethylidene) bis (oxy)]-pregna-1,4-diene-3,20-dione. It contains not less than 97.0% and not more than 103.0% of $C_{26}H_{32}F_2O_7$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless. Sparingly soluble in acetone or dioxane; slightly soluble in ethanol; insoluble in water or petroleum ether.

Specific optical rotation +80° to +88°, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Identification (1) Dissolve about 10 mg in 1 ml of methanol by warming, add 1 ml of hot alkaline cupric tartrate TS; a red precipitate is produced.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(3) The infrared absorption spectrum (Appendix IV C) is

concordant with the reference spectrum of fluocinonide acetate (Appendix XVI).

(4) It yields the reaction characteristic of organic fluorine compounds (Appendix III).

Fluorine Carry out the test for fluorine (Appendix VIII E): not less than 7.0%.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (97:3) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in chloroform-methanol (9:1) containing (1) 3 mg per ml, (2) 60 μ g per ml of the substance being examined. After developing and removal of the plate, dry in air and then at 105°C for 10 minutes, cool and spray with alkaline tetrazolium blue TS. Examine immediately, not more than 2 secondary spots are obtained in the chromatogram of solution (1); and no secondary spot is more intense than the principal spot in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Selenium Carry out the limit test for selenium (Appendix VIII D), using 50 mg of the substance being examined. Complies with the requirement (0.010%).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (60:10:30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of fluocinonide. The resolution factor between the peaks of fluocinonide and internal standard is not less than 4.0.

Internal Standard Solution Dissolve hydrocortisone in mobile phase to produce a solution of 0.12 mg per ml.

Procedure Dissolve about 14 mg of fluocinonide CRS, accurately weighed, in a 100 ml volumetric flask, with 60 ml of methanol and 10 ml of acetonitrile, dilute with water to volume, mix well, use as the reference solution. Measure accurately 5 ml each of the reference solution and the internal standard solution into a 50 ml volumetric flask, dilute with mobile phase to volume, mix well, inject 20 μ l of the resulting solution into the column, record the chromatogram. Repeat the operations using a quantity of the substance being examined instead of fluocinonide CRS. Calculate the content of $C_{26}H_{32}F_2O_7$ with respect to the peak area in the chromatogram by internal standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers.

Preparation Fluocinonide Cream

Fluocinonide Cream

Fluocinonide Cream contains not less than 85.0% and not more than 115.0% of the labelled amount of fluocinonide ($C_{26}H_{32}F_2O_7$).

Description White cream.

Identification The retention time of principal peak of the substance being examined is identical with that of principal

peak of the reference solution in the chromatogram obtained in Assay.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-ether (62:38:2) as the mobile phase. Detection wavelength is 240 nm, and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of fluocinonide. The resolution factor between the peaks of fluocinonide and internal standard complies with related requirements.

Internal Standard Solution Dissolve an accurately weighed quantity of norethisterone CRS in methanol to produce a solution of about 0.15 mg per ml.

Procedure Dissolve an accurately weighed quantity of fluocinonide CRS in methanol to produce a solution of about 0.125 mg per ml as the reference solution. Transfer 10 ml of the reference solution and 5 ml of the internal standard solution, accurately measured, to a 50 ml volumetric flask, dilute with methanol to volume, mix well, inject 20 μ l into the column, record the chromatogram. Weigh accurately a quantity of the substance being examined equivalent to about 1.25 mg of fluocinonide, add 30 ml of methanol, heat in a water bath at 80°C for 2 minutes, shake to dissolve fluocinonide. Cool to room temperature, add 5 ml of internal standard solution, accurately measured, dilute with methanol to volume and mix well. Allow the mixture to cool in an ice bath for at least 2 hours, filter quickly, inject 20 μ l of the successive filtrate into the column. Calculate the content of $C_{26}H_{32}F_2O_7$ with respect to the peak area in the chromatogram by internal standard method.

Category As described under Fluocinonide.

Strength (1) 10 g: 2.5 mg (2) 20 g: 5 mg

Storage Preserve in tightly closed containers, stored in a cool place.

Fluorescein Sodium

$C_{20}H_{10}Na_2O_5$ 376.28

[518-47-8]

Fluorescein Sodium is 3', 6''-dihydroxy-spiro [isobenzofuran-1 (3H), 9'-[9H] xanthene]-3-one disodium salt. It contains not less than 98.5% of $C_{20}H_{10}Na_2O_5$, calculated on the dried basis.

Description An orange-red powder; odourless; almost tasteless; Hygroscopic.

Freely soluble in water; sparingly soluble in ethanol.

Identification (1) Place 1 drop of a solution (1→2000) on a piece of filter paper, a yellow spot is produced, when exposed while moist to bromine vapour for 1 minute and then to ammonia vapour, the spot becomes deep pink.

(2) An aqueous solution is strongly fluorescent, even in extreme dilution; the fluorescence disappears when the

solution is acidified and reappears when it is made alkaline.

(3) The infrared absorption spectrum (Appendix IV A) is concordant with the reference spectrum of fluorescein sodium (Appendix XVI).

(4) The incinerated residue yields the reactions characteristic of sodium salts (Appendix III).

Chloride Dissolve 0.10 g in 50 ml of water, carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.35%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the solution described under test for Chloride. Any opalescence produced is not more pronounced than that of a reference using 2.5 ml of potassium sulfate standard solution (0.50%).

Loss on drying When dried to constant weight at 105°C, loses not more than 7.0% of its weight (Appendix VIII L).

Zinc Dissolve 0.10 g in 10 ml of a saturated solution of sodium chloride, add 2 ml of dilute hydrochloric acid, mix well and filter. Add 1 ml of potassium ferrocyanide TS to the filtrate, no turbidity is produced.

Assay Dissolve about 0.5 g, accurately weighed, in 20 ml of water, add 5 ml of dilute hydrochloric acid and extract with four portions, each of 20 ml, of a mixture of *n*-butanol-chloroform (1:1). Wash the combined extracts with 10 ml of water, extract the washings with 5 ml of a mixture of *n*-butanol-chloroform (1:1), and transfer the combined extracts to a container, previously dried to constant weight at 105°C. Evaporate the extracts to dryness on a water bath in current air. Dissolve the residue in 10 ml of ethanol, evaporate to dryness on a water bath, and dry to constant weight at 105°C, weigh accurately. Each g of residue is equivalent to 1.132 g of $C_{20}H_{10}Na_2O_5$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers.

Preparation Fluorescein Sodium Injection

Fluorescein Sodium Injection

Fluorescein sodium Injection is a sterile solution of fluorescein sodium in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of fluorescein sodium ($C_{20}H_{10}Na_2O_5$).

Description A brown clear liquid.

Identification Complies with tests (1) and (2) for Identification described under Fluorescein Sodium.

pH value 8.0-9.8 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 2.5 ml (for strength 0.3 g) or 2.5 ml of a dilute solution (for strength 0.6 g) (diluted with equal volume of Water for Injection) per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute a quantity equivalent to about 0.5 g of fluorescein sodium with water to 20 ml, shake well. Carry out the Assay described under Fluorescein Sodium, beginning at the words "add 5 ml of dilute hydrochloric acid until fluorescein is precipitated...".

Category As described under Fluorescein Sodium.

Strength (1) 3 ml:0.3 g (2) 3 ml:0.6 g

Storage Preserve in well closed containers.

Fluorouracil

$C_4H_3FN_2O_2$ 130.08

[51-21-8]

Fluorouracil is 5-fluoro-2,4 (1*H*, 3*H*)-pyrimidinedione. It contains not less than 97.0% and not more than 103.0% of $C_4H_3FN_2O_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder.

Sparingly soluble in water; slightly soluble in ethanol; practically insoluble in chloroform; soluble in dilute hydrochloric acid or sodium hydroxide solution.

Identification (1) Shake 5 ml of the water solution (1→100) with 1 ml of bromine TS, the colour of bromine is disappeared; add 2 ml of barium hydroxide TS, a violet precipitate is produced.

(2) Rotate the test tube containing about 1 ml of saturated solution of chromium trioxide in sulfuric acid, the solution is spread evenly on the wall; add about 2 mg of the finely powdered substance being examined, heat gently and rotate the test tube, the solution can no longer be spread evenly on the wall, but attached to it with greasy substance.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 265 nm and a minimum at 232 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix XVI A) is concordant with the reference spectrum of fluorouracil (Appendix XVI).

Chloride Dissolve 2.0 g, with heating, in 100 ml of water, cool and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 50 ml of the filtrate obtained in the test for chlorides. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.02%).

Fluorine Weigh accurately about 15 mg, Carry out the method for determination of fluorine (Appendix VIII E). It contains not less than 13.1% and not more than 14.6% of fluorine.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 0.50 g; not more than 0.002%.

Assay To a quantity, accurately weighed, add 0.1 mol/L hydrochloric acid solution to produce a solution of 10 µg per ml and measure the absorbance at 265 nm (Appendix IV A).

Calculate the content of $C_4H_3FN_2O_2$, taking 552 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Fluorouracil Cream
(2) Fluorouracil Injection

Fluorouracil Cream

Fluorouracil Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of fluorouracil ($C_4H_3FN_2O_2$).

Description A white cream.

Identification Place 1 g of the cream in a beaker, add 35 ml of water and melt by heating on a water bath, cool in an ice bath, filter and evaporate the filtrate to dryness. The residue complies with tests (1) and (2) for Identification described under Fluorouracil.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Place a quantity of the cream, accurately weighed, equivalent to about 0.1 g of fluorouracil in a beaker, add 1 g of sodium chloride and melt by heating on a water bath, add 50 ml of water, boil and allow to cool. Filter and transfer the filtrate to a 200 ml volumetric flask, repeat the extraction three times, wash the filter, transfer the washings into the flask and dilute with water to volume. Carry out the method for determination of nitrogen (Appendix VII D, method 1), using 100 ml of the resulting solution, accurately measured. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 6.504 mg of $C_4H_3FN_2O_2$.

Category As described under Fluorouracil.

Strength (1) 4 g:20 mg (2) 4 g:100 mg

Storage Preserve in tightly closed containers, stored in a cool place.

Fluorouracil Injection

Fluorouracil Injection is a sterile solution of fluorouracil in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of fluorouracil ($C_4H_3FN_2O_2$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 2 ml add 1 ml of bromine TS, shake, the colour of bromine is discharged, then add 2 ml of barium hydroxide TS, a violet precipitate is produced.

(2) Rotate the test tube containing about 1 ml of saturated solution of chromium in trioxide-sulfuric acid, the solution is spread evenly on the wall; Add 2 drops of the injection and heat gently, the solution can no longer be spread evenly on the wall, but attached to it with greasy substance.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 265 nm and a minimum at 232 nm (Appendix IV A).

pH value 8.4-9.2 (Appendix VI H).

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Dilute an accurately measured quantity with hydrochloric acid solution (9→1000) to produce a solution of 10 µg per ml and measure the absorbance at 265 nm (Appendix IV A). Calculate the content of $C_4H_3FN_2O_2$, taking 552 as the value of A (1%, 1 cm).

Category As described under Fluorouracil.

Strength (1) 5 ml:0.125 g (2) 10 ml:0.25 g

Storage Preserve in tightly closed containers, protected from light.

Fluphenazine Decanoate

$C_{32}H_{44}F_3N_3O_2S$ 591.78

[69-23-8]

Fluphenazine Decanoate is 4-[3-[2-(trifluoromethyl)-10-*H*-phenothiazin-10-yl]propyl]-1-piperazine ethanol decanoate. It contains not less than 98.0% and not more than 102.0% of $C_{32}H_{44}F_3N_3O_2S$, calculated on the dried basis.

Description A pale yellow to yellowish-brown viscous liquid; the colour is intensified gradually on exposure to light.

Very soluble in methanol, ethanol, chloroform, anhydrous ether or vegetable oil; insoluble in water.

Identification (1) Mix well about 15-20 mg with 0.1 g of sodium carbonate and 0.1 g of potassium carbonate in a crucible. Ignite at 600°C for 15-20 minutes, cool. Add 2 ml of water to dissolve the residue, acidify with hydrochloric acid solution (1→2). Filter, add 0.5 ml of zirconyl alizarin TS to the filtrate, a yellow colour is produced.

(2) Dissolve about 50 mg in 2 ml of methanol, add 3 ml of 0.1% palladium chloride solution, a red precipitate is produced and the colour is intensified on adding excess palladium chloride solution.

(3) The light absorption of a 10 µg per ml solution in ethanol exhibits a maximum at 260 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fluphenazine decanoate (Appendix XVI).

Colour of acetone solution The colour of a 5% solution in acetone is not more intense than that of reference solution Y_4 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of acetone-cyclohexane-concentrated ammonia solution (80:30:5) as the mobile phase. Apply separately to the plate 20 µl each of two solutions in methanol containing (1) 25 mg per ml of the substance being examined, (2) 0.50 mg per ml of fluphenazine hydrochloride CRS. After developing and removal of the plate, allow it to dry in air and examine under ultraviolet light (254 nm). Then spray the plate with sulfuric acid solution (1→2) and examine in day light. By both methods of visualisation, any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with

solution (2).

Loss on drying When dried in vacuum at 60°C for 3 hours, loses not more than 1.0% of its weight. (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.59 mg of $C_{32}H_{44}F_3N_3O_2S$.

Category Antipsychotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Fluphenazine Decanoate Injection

Fluphenazine Decanoate Injection

Fluphenazine Decanoate Injection is a sterile solution of fluphenazine decanoate in oil for injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of fluphenazine decanoate ($C_{32}H_{44}F_3N_3O_2S$).

Description A clear yellow or orange-yellow oily liquid.

Identification Complies with tests (1), (2) and (3) for Identification described under Fluphenazine Decanoate.

Colour The colour is not more intense than that of the reference solution of Y_{10} (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a plate of 20 cm × 20 cm in size. For the first development use chloroform as the mobile phase. Apply 1 µl of the injection to an appropriate position on right corner at the bottom of the plate and develop until the solvent reaches at a distance of 12 cm from the upper edge of the plate. After removal of the plate, allow it to dry in air. Turn the plate clockwise through an angle of 90°. Apply 10 µl of a 0.02% solution of fluphenazine hydrochloride CRS in methanol to an appropriate position on right corner at the bottom of the plate. For the second development use a mixture of acetone-cyclohexane-concentrated ammonia solution (80 : 30 : 5) as the mobile phase. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). Spray the plate with sulfuric acid solution (1 → 2) and examine in day light. By both methods of visualization, any spot other than the principal spot in the chromatogram obtained with the injection is not more intense than the principal spot obtained with the reference solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve about 5 ml with a "to contain" pipet, accurately measured, in 20 ml of glacial acetic acid, and add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.59 mg of $C_{32}H_{44}F_3N_3O_2S$.

Category As described under Fluphenazine Decanoate.

Strength 1 ml : 25 mg

Storage Preserve in well closed containers, protected from light, stored in a cool place.

Fluphenazine Hydrochloride

$C_{22}H_{26}F_3N_3OS \cdot 2HCl$ 510.44

[69-23-8]

Fluphenazine Hydrochloride is 4-[3-[2-(trifluoromethyl)-10H-phenothiazin-10-yl]propyl]-1-piperazineethanol dihydrochloride. It contains not less than 98.0% and not more than 102.0% of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter; colour changed easily on exposure to light.

Freely soluble in water; sparingly soluble in ethanol; slightly soluble in acetone; insoluble in benzene and ether.

Melting range 226-233°C, with decomposition (Appendix VI C).

Specific absorbance Measure the light absorbance at 255 nm (Appendix IV A) of a solution of 10 µg per ml in hydrochloric acid solution (9 → 1000), the value of A (1%, 1 cm) is 553-593.

Identification (1) Rotate the test tube containing about 1 ml of saturated solution of chromium trioxide in sulfuric acid, the solution is spread evenly on the wall; add about 2 mg of the substance being examined, heat gently and rotate the test tube, the solution can no longer be spread evenly on the wall, but attached to it with greasy substance.

(2) Dissolve 5 mg in 5 ml of sulfuric acid, a pale red colour is produced, which changes to reddish-brown on warming.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of fluphenazine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 20 ml of water, pH 1.9-2.3 (Appendix VI H).

Loss on drying When dried to constant weight at 80°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Ignite 1.0 g, not more than 0.2% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is

equivalent to 25.52 mg of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$.

Category Antipsychotic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Fluphenazine Hydrochloride Tablets
(2) Fluphenazine Hydrochloride Injection

Fluphenazine Hydrochloride Injection

Fluphenazine Hydrochloride Injection is a sterile solution of Fluphenazine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 110.0% of the labelled amount of fluphenazine hydrochloride ($C_{22}H_{26}F_3N_3OS \cdot 2HCl$).

Description A clear, colourless liquid.

Identification (1) Mix a quantity equivalent to about 20 mg of fluphenazine hydrochloride with 100 mg of sodium carbonate and 100 mg of potassium carbonate. Gently, with caution, heat the mixture, then evaporate to dryness, then ignite at 600°C until the incineration complete. Dissolve the residue in 2 ml of water, acidify with hydrochloric acid solution (1:2) and filter. Add 0.5 ml of zirconium alizarin TS to the filtrate; the colour of the solution changes from red to yellow.

(2) To a quantity equivalent to about 3 mg of fluphenazine hydrochloride add a few drops of sulfuric acid; a reddish yellow colour appears which changes to green on warming.

(3) Yields the reactions characteristic of chloride (Appendix III).

pH value 4.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Transfer an accurately measured quantity equivalent to about 50 mg of fluphenazine hydrochloride to a 50 ml beaker. Add 2 ml of 6 mol/L hydrochloric acid solution and mix well. Heat to 70-80°C on a water bath, add dropwise 8 ml of silicotungstic acid TS, allow to stand for 2 minutes. Filter through a tared sintered glass crucible, wash the precipitate with 20 ml of hydrochloric acid solution (1→20) in portions, then with three 5 ml portions of water. Dry to constant weight at 105°C and weigh accurately. Each g of precipitate is equivalent to 0.2721 g of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$.

Category As described under Fluphenazine Hydrochloride.

Strength 2 ml:10 mg

Storage Protected from light.

Fluphenazine Hydrochloride Tablets

Fluphenazine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of fluphenazine hydrochloride ($C_{22}H_{26}F_3N_3OS \cdot 2HCl$).

Description Sugar-coated tablets with white core.

Identification To a quantity of powdered tablets with coating removed equivalent to about 30 mg of fluphenazine hydrochloride add 15 ml of ethanol, shake to dissolve fluphenazine hydrochloride and filter. Evaporate the filtrate to dryness. The residue complies with the tests (1), (2),

(4) for Identification described under Fluphenazine Hydrochloride.

Content uniformity Comply with the requirements (Appendix X E).

Triturate 1 tablet (with coating removed) with 70 ml of hydrochloric acid solution (9→1000), transfer to a 100 ml volumetric flask, shake thoroughly to dissolve fluphenazine hydrochloride, dilute with the same solvent to volume and filter. Measure accurately 10 ml of the successive filtrate to a 25 ml volumetric flask, dilute with the same solvent to volume and mix well. Determine the content of fluphenazine hydrochloride as described under the Assay.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Weigh accurately a quantity of the powder equivalent to about 10 mg of fluphenazine hydrochloride into a 100 ml volumetric flask, add about 70 ml of hydrochloric acid solution (9→1000), shake 30 minutes to dissolve fluphenazine hydrochloride, dilute with the same solvent to volume. Mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with the same solvent to volume and mix well. Measure the light absorbance of the resulting solution at 255 nm (Appendix IV A). Calculate the content of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$, taking 573 as the value of A (1%, 1 cm).

Category As described under Fluphenazine Hydrochloride.

Strength 2 mg

Storage Preserve in tightly closed containers, protected from light.

Flurazepam Hydrochloride

$C_{21}H_{23}ClFN_3O \cdot 2HCl$ 460.81 [1172-18-5]

Flurazepam Hydrochloride is 7-chloro-1-[2-(diethylamino)ethyl]-5-(*o*-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one dihydrochloride. It contains not less than 98.5% of $C_{21}H_{23}ClFN_3O \cdot 2HCl$, calculated on the dried basis.

Description An almost white to pale yellow crystalline powder; almost odourless; taste, bitter; hygroscopic; deteriorated on exposure to light. Very soluble in water; freely soluble in methanol; soluble in ethanol or chloroform.

Identification (1) Dissolve about 10 mg in 1 ml of water, add potassium iodobismuthate TS, an orange red precipitate is produced.

(2) The light absorption of a solution of 10 µg per ml in methanolic sulfuric acid solution (1→36) exhibits three maxima at 239 nm, 284 nm and 363 nm, the ratio of the absorbance at 239 nm to that at 284 nm is 1.95-2.50.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of flurazepam hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic

of chlorides (Appendix III).

Fluorides *Reference solution* Dissolve 221 mg of sodium fluoride, accurately weighed, in 20 ml of water in a 100 ml volumetric flask, add 1 ml of sodium hydroxide solution (1→2500), dilute with water to volume and mix well. Store in a well closed plastic container. (each ml is equivalent to 1 mg of F).

Test solution Dissolve about 1 g, accurately weighed, in sodium citrate BS (pH 5.25) in a 100 ml volumetric flask and dilute to volume, mix well.

Procedure Dilute a quantity of the reference solution with sodium citrate BS (pH 5.25) to produce solutions of 1, 3, 5 and 10 µg per ml as standard solutions. Place a quantity each of the standard solutions and the test solution in separate 150 ml plastic beakers containing stirring rod coated with polytetrafluoro-ethylene. Measure the electric potentials of the solutions with a potentiometer equipped with fluoride selective electrode and calomel electrode (use a saturated solution of potassium chloride in 30% isopropanol as the salt bridge). A calibration curve produced by plotting the concentrations of fluoride (µg/ml) against the corresponding electric potentials (mV) with semilogarithmic paper. Measure the potential of the test solution, the content of fluoride is not more than 0.05%.

Related substances Protected from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of ether-diethylamine (150:4) as the mobile phase. Apply separately to the plate 10 µl each of three solutions in methanol containing (1) 0.10 g of the substance being examined per ml, (2) 0.1 mg of 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one CRS per ml, (3) 0.1 mg of 5-hydro-2-(2-diethylaminoethyl (amino)-2'-fluorobenzophenone hydrochloride CRS per ml. Equilibrate by lining the inner wall of the chromatographic chamber with filter paper, previously soaked by the mobile phase. Place the freshly prepared mobile phase in the chamber, develop immediately. After developing and removal of the plate, allow to stand in air for 5 minutes. Repeat developing with new freshly prepared mobile phase, after removal of the plate, dry in air and examine under ultraviolet light (254 nm). The colour of any secondary spot, corresponding to the spots obtained with reference solution (2) or (3), in the chromatogram obtained with solution (1) is not more intense than that of the principal spot obtained with solution (2) or (3) (0.1%).

Loss on drying When dried at 105°C for 4 hours, loses not more than 1.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of acetic anhydride in a 100 ml beaker on warming, add 5 ml of mercuric acetate TS. Carry out the method for potentiometric titration with glass-calomel electrode system, titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.04 mg of C₂₁H₂₃ClFN₃O • 2HCl.

Category Antianxiety agent.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Flurazepam Hydrochloride Capsules

Flurazepam hydrochloride Capsules

Flurazepam hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of flurazepam hydrochloride (C₂₁H₂₃ClFN₃O • 2HCl).

Identification (1) Shake a quantity of the contents equivalent to about 10 mg of flurazepam hydrochloride with 2 ml of water and filter. The filtrate complies with test (1) and (4) for Identification described under Flurazepam Hydrochloride.

(2) Measure the light absorption of the solution obtained in Assay, the ratio of the absorbance at 239 nm to that at 284 nm is 1.95-2.50.

Content uniformity Protect from light throughout the procedure. Comply with the requirements for content uniformity (Appendix X E). Transfer the content of 1 capsule to a 100 ml volumetric flask, wash the shell with methanolic sulfuric acid solution (1→36), transfer the washings to the same volumetric flask. Shake with about 70 ml of methanolic sulfuric acid solution (1→36) to dissolve flurazepam hydrochloride, dilute to volume with the same solvent, mix well and filter. Transfer 2 ml of the successive filtrate, accurately measured, to a 25 ml volumetric flask, dilute to volume with methanolic sulfuric acid solution (1→36) and mix well. Carry out the procedure described under Assay, beginning at the words "Measure the absorbance of the resulting solution..." (Appendix IV A).

Related substances Protect from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of ether-diethylamine (150:4) as the mobile phase. Apply separately to the plate 20 µl each of the following solutions. For solution (1) shake a quantity of the contents equivalent to about 10 mg of flurazepam hydrochloride with 2 ml of methanol, centrifuge and use the supernatant solution. Solution (2) contains 0.05 mg of 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one CRS per ml in methanol. Solution (3) contains 0.05 mg of 5-hydro-2-(2-diethylaminoethyl (amino)-2'-fluorobenzophenone hydrochloride CRS per ml in methanol. Add the mobile phase to the chromatographic chamber, equilibrate by lining the inner wall of the chamber with filter paper, previously soaked by the mobile phase. Place the freshly prepared mobile phase in the chamber and develop immediately. After developing and removal the plate, allow to stand in air for 5 minutes. Repeat developing with another freshly prepared mobile phase. After removal of the plate, dry in air and examine under ultraviolet light (254 nm). The colour of any secondary spot, corresponding to the spots obtained with reference solution (2) or (3), in the chromatogram obtained with solution (1) is not more intense than that of the principal spot obtained with solution (2) or (3).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Weigh accurately 20 capsules, remove the contents, weigh accurately the shell of each capsule and calculate the average content of the capsules. Weigh accurately a quantity of the mixed contents equivalent to about 10 mg of flurazepam hydrochloride in 100 ml volumetric flask, shake with about 80 ml of methanolic sulfuric acid solution (1→36) to dissolve flurazepam hydrochloride, dilute with methanolic

sulfuric acid solution (1 → 36) to volume, mix well and filter. Dilute a quantity of successive filtrate, accurately measured, with methanolic sulfuric acid solution (1 → 36) to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 239 nm (Appendix IV A). Repeat the operation, using a solution containing 10 µg of flurazepam hydrochloride CRS per ml, in methanolic sulfuric acid solution (1 → 36). Calculate the content of $C_{21}H_{23}ClFN_3O \cdot 2HCl$.

Category As described under Flurazepam Hydrochloride.

Strength 15 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Folic Acid

$C_{19}H_{19}N_7O_6$ 441.40

[59-30-3]

Folic Acid is N-[4-[(2-amino-1,4-dihydro-4-oxo-6-pteridiny] methyl amino] benzoyl]-L-glutamic acid. It contains not less than 95.0% and not more than 102.0% of $C_{19}H_{19}N_7O_6$, calculated on the anhydrous basis.

Description A yellow or orange-yellow crystalline powder; odourless; tasteless.

Insoluble in water, ethanol, acetone, chloroform or ether; freely soluble in dilute solution of sodium hydroxide or sodium carbonate.

Identification (1) Dissolve about 0.2 mg in 10 ml of 0.4% sodium hydroxide solution with shaking, add 1 drop of potassium permanganate TS and mix well; the solution becomes bluish-green and shows a bluish-green fluorescence under ultraviolet light.

(2) The light absorption of a solution containing 10 µg per ml in 0.4% sodium hydroxide solution exhibits maxima at 256 nm, 283 nm and 365 nm \pm 4 nm, the ratio of the absorbance at 256 nm to that at 365 nm is 2.8-3.0 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of folic acid (Appendix XVI).

Water To about 0.1 g, accurately weighed, add 5 ml of a mixture of chloroform-dehydrated methanol (4:1); carry out the determination of water (Appendix VIII M, method 1 A); not more than 8.5%.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. Dissolve 6.8 g of potassium dihydrogen phosphate in 70 ml of 0.1 mol/L potassium hydroxide solution, dilute with water to 850 ml and adjust to pH 6.3 \pm 0.1, then add 80 ml of methanol and dilute with water to 1000 ml as the mobile phase. Detection wavelength is 254 nm.

Procedure Dissolve about 5 mg, accurately weighed, in 15 ml of 0.5% ammonia solution in a 25 ml volumetric flask, dilute with water to volume and mix well. Inject 10 µl into the column and record the chromatogram. Repeat the operation, using folic acid CRS instead of the substance being examined. Calculate the content of $C_{19}H_{19}N_7O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Vitamin.

Storage Preserve in tightly closed containers, protected from light.

Preparation Folic Acid Tablets

Folic Acid Tablets

Folic Acid Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of folic acid ($C_{19}H_{19}N_7O_6$).

Description Yellow or orange-yellow tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.4 mg of folic acid add 20 ml of 0.4% sodium hydroxide solution, shake to dissolve folic acid and filter. The filtrate complies with test (1) for Identification described under Folic Acid, using 10 ml.

(2) Comply with test (2) for Identification described under Folic Acid, using the remaining filtrate obtained in Identification test (1) diluted with an equal volume of 0.4% sodium hydroxide solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E).

(1) Place 1 tablet in a 25 ml volumetric flask, proceed as described under Assay, beginning at the words "transfer to a 25 ml volumetric flask...". (strength 5 mg).

(2) Place 1 tablet in a 10 ml volumetric flask, add 5 ml of 0.5% ammonia solution and heat on a water bath for 20 minutes to dissolve folic acid with shaking. Allow to cool, dilute with water to volume, mix well and filter, take the successive filtrate as the test solution. Dissolve about 10 mg of folic acid CRS, accurately weighed, in 50 ml of 0.5% ammonia solution and mix well. Transfer 2 ml to a 10 ml volumetric flask, dilute with water to volume, mix well, take the solution as the reference solution. Carry out the method described under Assay, inject 10 µl of the resulting solutions separately into the column, calculate the content of $C_{19}H_{19}N_7O_6$ (strength 0.4 mg).

Dissolution (1) Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 6.8) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter, take the successive filtrate as the test solution. Dissolve a quantity of folic acid CRS in phosphate BS (pH 6.8) to produce a solution of 6 µg per ml. Measure the absorbance of the resulting solutions at 281 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{19}N_7O_6$ from each tablet. Not less than 70% of the labelled amount is dissolved (strength 5 mg).

(2) Carry out the dissolution test (Appendix X C, method 3), using 100 ml of phosphate BS (pH 6.8) as the dissolution medium, adjust the rotational speed of the paddle to 70 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, take the successive filtrate as the test solution. Dissolve a quantity of folic acid CRS in phosphate BS (pH 6.8) to produce a solution of 4 µg per ml. Measure the absorbance of the resulting solutions at 281

nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{19}N_7O_6$ from each tablet. Not less than 75% of the labelled amount is dissolved (strength 0.4 mg).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 50 tablets (0.4 mg) or 20 tablets (5 mg). Transfer a quantity, accurately weighed, equivalent to about 5 mg of folic acid to a 25 ml volumetric flask, add 15 ml of 0.5% ammonia solution and heat in a water bath for 20 minutes with shaking to dissolve folic acid. Allow to cool, dilute with water, mix well and filter. Carry out the Assay as described under Folic acid, using the successive filtrate as the test solution. Calculate the content of $C_{19}H_{19}N_7O_6$.

Category As described under Folic Acid.

Strength (1) 0.4 mg (2) 5 mg

Storage Preserve in tightly closed containers, protected from light.

Formaldehyde Solution

Formaldehyde Solution contains not less than 36.0% (g/g) of formaldehyde CH_2O . It contains 10%-12% of methanol to prevent polymerization.

Description A colourless or almost colourless clear liquid; odour, characteristic, pungent and irritating to the mucous membrane of the throat and nose. It easily becomes turbid when kept at a cold place for a long time. Miscible with water or ethanol.

Identification (1) dilute 5 drops with 1 ml of water in a test tube, add 3 drops of ammoniated silver nitrate TS; a grey precipitate, or a silver mirror is formed.

(2) Add a few drops of fuchsin-sulfurous acid TS and dilute hydrochloric acid to a small volume of the solution being examined, a red colour is produced.

Acidity Dilute 5.0 ml with 5 ml of water, add 2 drops of phenolphthalein IS and titrate with sodium hydroxide (0.1 mol/L) VS to pink colour; not more than 1.0 ml of sodium hydroxide (0.1 mol/L) VS is consumed.

Assay To about 1.5 ml, accurately weighed, add a mixture of 10 ml of water, 25 ml of hydrogen peroxide TS and 2 drops of bromothymol blue IS, add sodium hydroxide (1 mol/L) VS dropwise until a blue colour is obtained; then add accurately 25 ml of sodium hydroxide (1 mol/L) VS, put a small glass funnel on the mouth of the conical flask, heat the mixture on a water bath for 15 minutes, shake occasionally, allow it to cool, wash the funnel with water, add 2 drops of bromothymol blue IS and titrate with hydrochloric acid (1 mol/L) VS until a yellow colour is obtained. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 30.03 mg of CH_2O .

Category Antiseptic and Disinfectant.

Storage Preserve in tightly closed containers, protect from freezing.

Fosfomycin Calcium

$C_3H_5CaO_4P \cdot H_2O$ 194.14

Fosfomycin calcium is calcium (-)-(1R, 2S)-1,2-epoxypropyl phosphonic acid monohydrate. It has a potency of not less than 720 Fosfomycin Units per mg, calculated on the anhydrous basis.

Description A white crystalline powder; odorless. Slightly soluble in water; practically insoluble in acetone, chloroform, methanol, ether and benzene.

Specific optical rotation -3.5° to -5.0° , in a solution of 50 mg per ml in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-ethyl acetate-water-glacial acetic acid (4:2:3:1) as the mobile phase. Apply separately to the plate 2 μ l each of solution (1) containing 20 mg per ml of the substance being examined in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) and solution (2) containing 20 mg per ml of fosfomycin RS in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes), after developing and removal of the plate, dry in air and spray with a solution (containing 5 g of phosphomolybdic acid in 100 ml of acetic acid and 5 ml of sulfuric acid), heat at 105°C for 20 minutes. the colour and position of the principal spot in the chromatogram obtained with solution (1) corresponds to that of the principal spot obtained with solution (2).

(2) The infrared absorption spectrum (Appendix VI E) is concordant with the reference spectrum of Calcium fosfomycin.

(3) Yields the flame reaction of calcium salts (Appendix III).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Alkalinity Dissolve 0.1 g in 25 ml of water, pH 8.5-12.0 (Appendix VI H).

Fosfomycin calcium diol substances Dissolve about 0.1 g, accurately weighed, in 100 ml of water and 50 ml of potassium biphthalate BS (pH 6.4) (Dissolve 100 g of potassium biphthalate with 600 ml of water by warming in a 1000 ml volumetric flask, adjust pH to 6.4 ± 0.1 by adding about 40 ml of sodium hydroxide (4 \rightarrow 10), dilute to volume with water). in a 250 ml iodine flask. Add accurately 10 ml of 0.005 mol/L of sodium periodate solution, mix well. Stopper the flask and allow to stand in the dark place for 90 minutes at 25°C . Add 10 ml of 10% potassium iodide solution, stopper the flask and allow to stand in the dark place for 2 minutes. Titrate with sodium thiosulfate (0.01 mol/L) VS, add 1 ml of starch IS towards the end of the titration and continue titrating until the blue colour just disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.01 mol/L) VS is equivalent to 0.5304 mg of $C_3H_7CaO_5P \cdot H_2O$. Not more than 2.0%.

Water 8.5%-12.0% (Appendix VIII M, method 1 A),

dissolve the substance being examined with a mixture of formamide-methanol (1:1).

Heavy metals Dissolve 1.0 g in 2 ml of dilute hydrochloric acid, add 2 ml of dilute acetic acid and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Carry out the Microbiological Assay of Antibiotics (Appendix XI A), using a solution of about 500 Units per ml in sterile water. 1000 fosfomycin units is equivalent to 1 mg of $C_3H_7O_4P$.

Category Antibiotic.

storage Preserve in tightly closed containers, stored in a cool, dark and dry place.

preparation (1) Fosfomycin Calcium Tablets
(2) Fosfomycin Calcium Capsules
(3) Fosfomycin Calcium Granules

Fosfomycin Calcium Capsules

Fosfomycin Calcium Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of fosfomycin ($C_3H_7O_4P$).

Description Capsules containing white or almost white granules or powder.

Identification Dissolve a quantity of the contents of capsules in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) to produce a solution of 20 mg per ml of fosfomycin. Filter, the successive filtrate complies with test (1) for Identification described under Fosfomycin Calcium.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exact 30 minutes and filter. Dilute a quantity of the successive filtrate with 0.1 mol/L hydrochloric acid solution to produce a solution of 0.1 mg per ml of fosfomycin. Filter, measure accurately 5 ml of the successive filtrate in a 25 ml volumetric flask. Weigh accurately a quantity of the mixed contents obtained from the test for weight variation of contents equivalent to about the weight of contents of one capsule, add 0.1 mol/L hydrochloric acid solution, shake, dilute to produce a solution of 0.1 mg per ml of fosfomycin. Filter, measure accurately 5 ml of the successive filtrate in another 25 ml volumetric flask. Add 1 ml of a freshly prepared solution of ammonium persulfate (Dissolve 1 g of ammonium persulfate in 15 ml of water) respectively. Using a little water washing the wall of flask, boiling in water bath for 10 minutes. Add 2 ml of 1% urea solution, boiling in water bath for 10 minutes again, cool to room temperature, add 1.5 ml of 5% ammonium molybdate solution (Dissolve 10 g of ammonium molybdate with 100 ml of 5 mol/L sulfuric acid solution, add water to 200 ml) and 1 ml of 0.5% of sodium sulfite (Dissolve 0.5 g of sodium sulfite with 80 ml of water, add 0.2 g of *p*-methylaminophenol sulfate and 30 g of sodium metabisulfite, add 100 ml of water and mix well), dilute to volume with water, allow to stand for 20 minutes. Measure the absorbance of the resulting solutions at 650 nm using water as blank solution (Appendix IV A). Calculate the dissolution of $C_3H_7O_4P$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To the mixed contents obtained from the test for

weight variation of contents, weigh accurately, add sterile water to produce a solution of about 500 Units per ml and mix well. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under fosfomycin calcium. 1000 fosfomycin units is equivalent to 1 mg of $C_3H_7O_4P$.

Category As described under Fosfomycin Calcium.

Strength Calculated as $C_3H_7O_4P$
(1) 0.1 g (100000 units)
(2) 0.125 g (125000 units)
(3) 0.2 g (200000 units)

storage Preserve in tightly closed containers, stored in a dry place.

Fosfomycin Calcium Granules

Fosfomycin Calcium Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of fosfomycin ($C_3H_7O_4P$).

Description Suspension granules, taste, sweet, fragrant.

Identification (1) Weigh a quantity equivalent to about 0.1 g of fosfomycin to a tube with stopper, add 10 ml of 0.1 mol/L sodium periodate solution and 10 ml of 0.1 mol/L hydrochloric acid solution, warm in a water bath for 20 minutes, cool and filter. Add 1% sodium sulfite dropwise to 4 ml of the successive filtrate until the yellow colour disappears. Add fuchsin sulfurous acid solution, a purple-red colour appears after about 10 minutes.

(2) To produce a solution containing 20 mg per ml of the substance being examined in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) as the test solution and a solution containing 20 mg of per ml of fosfomycin RS in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) as the reference solution, mix equal volumes of the test solution and the reference solution as the mixing solution, filter. Carry out the test (1) for Identification described under Fosfomycin Calcium with the filtrate. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to that of the principal spot obtained with the reference solution, only one spot in the chromatogram is obtained with the mixing solution.

Acidity or alkalinity A suspension of 40 mg per ml in water, pH 6.5-7.5 (Appendix VI H).

Size of granules Carry out the method of granules size test (Appendix IX E). The total weight of granules, which can not pass through No. 5 sieve but can pass through No. 9 sieve should not be more than 10.0 per cent.

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Triturate the mixed contents obtained from the test for weight variation of contents, weigh accurately a quantity of the powder equivalent to about 50 mg of fosfomycin, add sterile water, shake thoroughly to produce a solution of about 500 Units per ml and mix well. Allow it to stand, measure accurately a quantity of the supernatant liquid and carry out the Assay described under Fosfomycin Calcium. 1000 fosfomycin units is equivalent to 1 mg of $C_3H_7O_4P$.

Category As described under Fosfomycin Calcium.

Strength Calculated as $C_3H_7O_4P$
(1) 0.1 g (100000 units)
(2) 0.5 g (500000 units)

storage Preserve in tightly closed containers, stored in a

dry place.

Fosfomycin Calcium Tablets

Fosfomycin Calcium Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of fosfomycin ($C_3H_7O_4P$).

Description White or almost white tablets.

Identification Dissolve a quantity of powdered tablets in 0.2 mol/L disodium edetate solution (sonicate for 30 minutes) to produce a solution of 20 mg per ml of fosfomycin. Filter, the successive filtrate complies with test (1) for Identification described under Fosfomycin Calcium.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L of hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exact 30 minutes and filter. Dilute a quantity of the successive filtrate with 0.1 mol/L hydrochloric acid solution to produce a solution of 0.1 mg per ml of fosfomycin. Filter, measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask. Weigh accurately and powder 10 tablets. Weigh accurately a quantity of powder equivalent to about the average weight of one tablet, add 0.1 mol/L hydrochloric acid solution, shake, dilute to produce a solution of 0.1 mg per ml of fosfomycin. Filter, measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask. Add 1 ml of a freshly prepared solution of ammonium persulfate (Dissolve 1 g of ammonium persulfate in 15 ml of water) respectively. Using a little water to wash the wall of flask, boiling in water bath for 10 minutes. Add 2 ml of 1% urea solution, boiling in water bath for 10 minutes again, cool to room temperature, add 1.5 ml of 5% ammonium molybdate solution (Dissolve 10 g of ammonium molybdate with 100 ml of 5 mol/L sulfuric acid solution, add water to 200 ml) and 1 ml of 0.5% sodium sulfite (Dissolve 0.5 g of sodium sulfite with 80 ml of water, add 0.2 g of *p*-methylaminophenol sulfate and 30 g of sodium metabisulfite, add 100 ml of water and mix well), dilute to volume with water, allow to stand for 20 minutes. Measure the absorbance of the resulting solutions at 650 nm using water as blank solution (Appendix IV A). Calculate the dissolution of $C_3H_7O_4P$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity, add sterile water to produce a solution of about 500 Units per ml and mix well. measure accurately a quantity of the supernatant liquid and carry out the Assay described under Fosfomycin Calcium. 1000 fosfomycin Units is equivalent to 1 mg of $C_3H_7O_4P$.

Category As described under Fosfomycin Calcium.

Strength Calculated as $C_3H_7O_4P$

- (1) 0.1 g (100000 Units)
- (2) 0.2 g (200000 Units)
- (3) 0.5 g (500000 Units)

storage Preserve in tightly closed containers, stored in a dry place.

Fosfomycin Sodium

$C_3H_5Na_2O_4P$ 182.02

Fosfomycin Sodium is disodium (-)-(1R, 2S) - 1,2-epoxypropyl phosphonic acid. It has a potency of not less than 700 Fosfomycin Units per mg, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; taste, salty; readily deliquescent in air. Freely soluble in water; slightly soluble in methanol; practically insoluble in ethanol or ether.

Specific optical rotation -4.2° to -5.5° , in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-ethyl acetate-water-acetic acid glacial (4:2:4:1) as the mobile phase. Apply separately to the plate 2 μ l each of solution (1) containing 20 mg per ml of the substance being examined and solution (2) containing 20 mg per ml of fosfomycin RS in 0.2 mol/L disodium edetate solution. After developing and removal of the plate, dry in air and spray with a solution (containing 5 g of phosphomolybdic acid in 100 ml of acetic acid and 5 ml of sulfuric acid), heat at 105°C for 20 minutes and examine. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2). (2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of fosfomycin CRS. (3) Yields the flame reaction of sodium salts (Appendix III).

Alkalinity Dissolve a quantity in water to produce a solution of 50 mg per ml, pH 9.0-10.5 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 1.1 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Fosfomycin sodium diol substances Dissolve about 0.2 g, accurately weighed, in 100 ml of water and 50 ml of potassium biphthalate BS (pH 6.4) in a 250 ml iodine flask. Add accurately 10 ml of 0.005 mol/L sodium periodate solution, mix well. Stopper the flask and allow to stand in the dark place at 25°C for 90 minutes. Add 10 ml of 10% potassium iodide solution, stopper the flask and allow to stand in the dark place for 2 minutes. Titrate with sodium thiosulfate (0.01 mol/L) VS, add 1 ml of starch IS towards the end of the titration and continue titrating until the blue colour just disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.01 mol/L) VS is equivalent to 0.5001 mg of $C_3H_7Na_2O_5P$. Not more than 0.5%.

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 1.0 g; not more than

0.001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.033 EU per 1000 Fosfomycin Units.

Sterility Dissolve a quantity in a suitable solvent, transfer to not less than 500 ml of 0.9% sterile sodium chloride solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Assay Carry out the Microbiological Assay of Antibiotics (Appendix XI A), using a solution of about 500 Units per ml in sterile water. 1000 Fosfomycin Units are equivalent to 1 mg of $C_3H_7O_4P$.

Category Antibiotic.

Storage Preserve in hermetically sealed containers, stored in a cool, dark and dry place.

Preparation Fosfomycin Sodium for Injection

Fosfomycin Sodium for Injection

Fosfomycin Sodium for Injection is a sterile mixture of fosfomycin sodium and suitable amount of citric acid. It contains not less than 90.0% and not more than 110.0% of the labelled amount of fosfomycin ($C_3H_7O_4P$).

Description A white crystalline powder.

Identification Complies with the tests (1), (3) for Identification described under Fosfomycin Sodium.

Acidity or alkalinity Dissolve a quantity in water to produce a solution containing 50 mg per ml, pH 6.5-8.5 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.15 g of fosfomycin per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Fosfomycin sodium diol substances Carry out the test for Fosfomycin sodium diol substance described under Fosfomycin Sodium, not more than 1.0%.

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin and Sterility Complies with the corresponding requirements described under Fosfomycin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Fosfomycin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Fosfomycin Sodium.

Strength Calculated as $C_3H_7O_4P$
 (1) 1 g (1000000 Units)
 (2) 2 g (2000000 Units)
 (3) 4 g (4000000 Units)

Storage Preserve in well closed containers, stored in a cool and dry place.

Fosfomycin Trometamol

$C_7H_{18}NO_7P$ 259.20

Fosfomycin Trometamol is disodium of fosfomycin and trometamol. It contains $C_7H_{18}NO_7P$ not less than 490 Fosfomycin Units per mg, calculated with reference to the anhydrous substance.

Description A white or almost white powder, odourless, taste, salty, hygroscopic.

Very soluble in water, soluble in methanol and slightly soluble in alcohol, practically insoluble in chloroform.

Specific optical rotation -2.0° to -4.0° , in a solution of 50 mg per ml in water (Appendix IV E).

Identification (1) To about 50 mg, add 2 ml of sodium periodate TS, add several drops of ammonium molybdate TS and nitric acid respectively, heat, a yellow precipitate is produced, which is soluble in ammonia TS after isolation.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-ethyl acetate-water-glacial acetic acid (4:2:3:1) as the mobile phase. Apply separately to the plate 2 μ l each of solution (1) containing 20 mg per ml of the substance being examined and solution (2) containing 20 mg per ml of fosfomycin RS in 0.2 mol/L disodium edetate solution. After developing and removal of the plate, dry in air and spray with a solution (containing 5 g of phosphomolybdic acid in 100 ml of acetic acid and 5 ml of sulfuric acid), heat at 100°C for 20 minutes and examine. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2).

(3) The infrared absorption spectrum is concordant with the reference spectrum of Fosfomycin Trometamol.

Test (1) and (2) may be omitted if test (3) is carried out.

Crystallinity Comply with the requirements for crystallinity test (Appendix IX D).

Acidity Dissolve 1 g in 20 ml of water, pH 3.5-5.5 (Appendix VI H).

Water Not more than 1.0% (Appendix VIII M, method 1).

Fosfomycin Ditrometamol Dissolve 0.25 g in water, accurately weighed, in 25 ml volumetric flask, add 0.1 ml of methyl red-bromocresol green (freshly prepared, used in a week), dilute with water to volume, mix well. Measure the light absorption at 527 nm and 615 nm separately (Appendix IV A). The ratio of the absorbance at 527 nm to that at 615 nm is not less than 1.76 (1 per cent, calculated as Fosfomycin ditrometamol).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 1.0 g. Not more than 0.001%.

Assay Carry out the Microbiological Assay of Antibiotics (Appendix XI A), using a solution of about 500 Units per ml in sterile water. 1000 Fosfomycin Units are equivalent to 1 mg of $C_3H_7O_4P$.

Category Antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Fosfomycin Trometamol Powder

Fosfomycin Trometamol Powder

Fosfomycin Trometamol Powder contains not less than 90.0 per cent and not more than 110.0 per cent of Fosfomycin Trometamol, calculated with reference to Fosfomycin ($C_3H_7O_4P$).

Discription A power, taste sweet.

Identification (1) To a quantity equivalent to about 50 mg of fosfomycin trometamol, add 2 ml of sodium periodate TS, add several drops of ammonium molybdate TS and nitric acid respectively, a yellow precipitate is produced, which is soluble in ammonia TS after isolation.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-ethyl acetate-water-glacial acetic acid (4:2:3:1) as the mobile phase. Apply separately to the plate 2 μ l each of solution (1) containing 20 mg per ml of the substance being examined and solution (2) containing 20 mg per ml of fosfomycin RS in 0.2 mol/L disodium edetate solution. After developing and removal of the plate, dry in air and spray with a solution (containing 5 g of phosphomolybdic acid in 100 ml of acetic acid and 5 ml of sulfuric acid), heat at 100°C for 20 minutes and examine. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2).

Water Not more than 1.0% (Appendix VIII M, method 1).

Acidity Dissolve a quantity of the powder equivalent to about 1 g of fosfomycin in 20 ml of water, pH 3.5-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for power.

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, produce a solution of about 500 Units per ml in sterile water. Carry out the Assay described under Fosfomycin Trometamol.

Category As described under Fosfomycin Trometamol.

Strength 3 g (3000000 Units) calculated as $C_3H_7O_4$.

Storage Preserve in tightly closed containers, stored in a dry place.

Ftibamzone

$C_{14}H_{15}N_7O_2S_2$ 377.45

Ftibamzone is an inclusion compound of 3-

phthalamoyl-2-oxobutylal-1,2-bis-(thiosemicarbazone) and dioxane. It contains not less than 97.0% and not more than 103.0% of $C_{14}H_{15}N_7O_2S_2$, calculated on the dried dioxane-free basis.

Description A yellow, crystalline powder; odourless; taste, slightly bitter; colour intensified gradually on exposure to light.

Freely soluble in dimethylformamide; slightly soluble in dioxane; practically insoluble in ethanol, ether or water; freely soluble in sodium hydroxide solution.

Identification (1) Dissolve about 10 mg in 2 ml of 0.4% sodium hydroxide solution. Acidify slightly with dilute hydrochloric acid and add copper sulfate TS, a brown precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV A) is concordant with the reference spectrum of ftibamzone (Appendix XVI).

Clarity of alkaline solution Dissolve 0.10 g in 5 ml of sodium hydroxide TS, add 15 ml of water, the solution is clear.

Dioxane Carry out the method for gas chromatography (Appendix V E), using a column packed with GDX-102 polymer porous beads; maintain the column temperature at 115°C, the number of theoretical plates of the column is not less than 300, calculated with reference to the peak of dioxane, the resolution factor between the peaks of dioxane and isobutanol (internal standard) is not less than 1.5. Weigh accurately about 50 mg of dioxane in a 25 ml volumetric flask, add accurately 2 ml of 1.5% (ml/ml) isobutanol solution, dilute with water to volume and mix well (solution A). Weigh accurately 0.25 g of the substance being examined in another 25 ml volumetric flask, dissolve in a quantity of 1% sodium hydroxide solution, neutralize with hydrochloric acid solution (9 \rightarrow 100) dropwise. Add accurately 2 ml of 1.5% (ml/ml) isobutanol solution, dilute with water to volume and mix well (solution B). The content of dioxane is not less than 14.0% and not more than 20.0%.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.002%.

Assay Dissolve about 25 mg, accurately weighed, in 5 ml of dimethylformamide in a 50 ml amber volumetric flask and add dilute ethanol to volume. Dilute an accurately measured quantity with dilute ethanol to produce a solution of about 10 μ g per ml and measure the absorbance at 347 nm (Appendix IV A). Repeat the operation using ftibamzone CRS (calculated on the dried, dioxane-free basis) instead of the substance being examined, and calculate the content of $C_{14}H_{15}N_7O_2S_2$.

Category Antivirotic agent.

Storage Preserve in tightly closed containers, protect from light.

Preparation (1) Ftibamzone Cream
(2) Ftibamzone Eye Drops
(3) Ftibamzone Liniment

Ftibamzone Cream

Ftibamzone Cream contains not less than 90.0% and not more than 110.0% of labelled amount of Ftibamzone ($C_{14}H_{15}N_7O_2S_2$).

Description A yellow cream.

Identification (1) To 0.3 g add 5 ml of 0.4% sodium hydroxide, mix well and shake with 10 ml of chloroform in a separator, allow to stand, acidify the aqueous layer with dilute hydrochloric acid to weak acidity, add copper sulfate TS, a brown precipitate is produced.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 347 nm (Appendix IV A).

Other requirement Complies with general requirements for creams (Appendix I F).

Assay Protect from light. Dissolve a quantity equivalent to 25 mg of ftibamzone, accurately weighed, in a 50 ml volumetric flask in about 30 ml of *N*, *N*-dimethylformamide by warming for 5 minutes, allow to stand and dilute to 50 ml with *N*, *N*-dimethylformamide and cool in ice bath for 15 minutes, filter, cool the filtrate to room temperature. Dilute 5 ml of successive filtrate, accurately measured, in a 50 ml volumetric flask, to volume with ethanol and shake well. Dilute 5 ml, accurately measured, of the solution to 25 ml with dilute ethanol. Measure the absorbance of the resulting solution at 347 nm (Appendix IV A). Repeat the operation using ftibamzone CRS (Calculated on dried dioxane-free basis) instead of the substance being examined, calculate the content of $C_{14}H_{15}N_7O_2S_2$.

Category As described under Ftibamzone.

Strength (1) 10 g:0.1 g (2) 10 g:0.3 g

Storage Preserve in well closed containers.

Ftibamzone Eye Drops

Ftibamzone Eye Drops contain not less than 80.0% and not more than 120.0% of the labelled amount of ftibamzone ($C_{14}H_{15}N_7O_2S_2$).

Description Pale yellow suspensions.

Identification (1) Centrifuge the content of 1 vial, discard most of the supernatant liquid. The residue complies, with the test (1) for Identification described under ftibamzone.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 347 nm (Appendix IV A).

pH value 4.0-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for Eye preparations (Appendix I G).

Assay Measure accurately a quantity of mixed eye drops equivalent to about 5 mg of ftibamzone in a 50 ml amber volumetric flask. Add 1 ml of dimethylformamide, shake thoroughly, add dilute ethanol to volume and mix well. Transfer 5 ml, accurately measured, to another 50 ml amber volumetric flask, add dilute ethanol to volume and mix well, measure the absorbance of the resulting solution and that of a solution of 10 µg per ml Ftibamzone CRS in dilute ethanol (calculated on the dried, dioxane-free basis) at 347 nm (Appendix IV A). Calculate the content of $C_{14}H_{15}N_7O_2S_2$.

Category As described under Ftibamzone.

Strength 8 ml : 8 mg

Storage Preserve in well closed containers, protected from light.

Ftibamzone Liniment

Ftibamzone Liniment contains not less than 90.0% and not more than 110.0% of the labelled amount of Ftibamzone ($C_{14}H_{15}N_7O_2S_2$).

Description A clear, pale yellow liquid.

Identification (1) To about 2 ml add 2 ml of water, add dilute hydrochloric acid with stirring to acidify the solution weakly, then add cupric sulfate TS, mix well; a reddish-brown colour is produced in the lower layer.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 345 nm (Appendix IV A).

Other requirements Complies with the general requirements for liniments (Appendix I T).

Assay *Reference solution* To an accurately weighed quantity of Ftibamzone CRS, equivalent to 25 mg of Ftibamzone calculated on dioxane free basis, in a 250 ml amber volumetric flask, add 125 ml of glacial acetic acid to dissolve, dilute with water to volume, and mix well. Dilute 5 ml of the solution, accurately measured, in a 50 ml amber volumetric flask, with glacial acetic acid solution (1→2) to volume and mix well.

Test solution Dilute an accurately measured quantity, equivalent to about 5 mg of Ftibamzone, in a 50 ml amber volumetric flask, with glacial acetic acid solution (1→2) to volume and mix well. Transfer 5.0 ml of the solution, accurately measured, to a 50 ml amber volumetric flask, dilute with glacial acetic acid solution (1→2) to volume and mix well.

Procedure Measure the absorbance of the above two solutions at 345 nm (Appendix IV A), and calculate the content of Ftibamzone.

Category As described under Ftibamzone.

Strength (1) 5 ml:25 mg (2) 10 ml:50 mg

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Ftivazide

$C_{14}H_{13}N_3O_3 \cdot H_2O$ 289.29

Ftivazide is *N*-(3-methoxy-4-hydroxybenzylidene)-*N'* isoniazide monohydrate. It contains not less than 98.0% of $C_{14}H_{13}N_3O_3 \cdot H_2O$.

Description A slightly yellow crystalline powder. Slightly soluble in ethanol; insoluble in water.

Melting range 227-231°C (Appendix VI C).

Identification To 50 mg add 50 mg of 2,4-dinitrochlorobenzene and 3 ml of ethanol, boil in a water bath for 2-3 minutes, cool, then add two drops of 10% sodium hydroxide solution, a red colour is produced.

Acidity Dissolve 0.25 g in 25 ml of water, shake for two minutes and filter. To the filtrate add two drops of sodium hydroxide (0.2 mol/L) VS and two drops of cresol red IS, a pink colour is produced.

Chlorides Dissolve 0.50 g in 25 ml of water, shake for two minutes and filter. To the filtrate add two drops of dilute nitric acid (Appendix VIII A), using 10 ml of filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfates Carry out the limit test for sulfate (Appendix VIII B), using 10 ml of the filtrate obtained in the test for Chlorides. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.05%).

Free isoniazide Dissolve 50 mg in 30 ml of cool water (0°C), shake and filter. To the filtrate add dilute hydrochloric acid TS until the colour of congo red IS changes, then add 0.1 ml of 0.1 mol/L sodium nitrite and mix. 1 drop of the resulting solution produces a blue spot on potassium iodidestarch TP and does not discharge within 5 minutes.

Loss on drying When dried to constant weight at 120°C, loses not more than 7.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 10 ml of acetic anhydride, heat gently, cool. Titrate with perchloric acid (0.1 mol/L) VS, using calomel-glass electrode indicating the end point. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/ml) VS is equivalent to 28.93 mg of $C_{14}H_{13}N_3O_3 \cdot H_2O$.

Category Antituberculosis.

Storage Preserve in tightly closed containers, protected from light.

Preparation Ftivazide Tablets

Ftivazide Tablets

Ftivazide Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of ftivazide ($C_{14}H_{13}N_3O_3 \cdot H_2O$).

Description pale yellow tablets.

Identification A quantity of powdered tablets equivalent to about 50 mg of ftivazide complies with the tests for Identification described under ftivazide.

Other requirement Comply with the general requirements for tablets (Appendix I A).

Assay Weight accurately and powder 20 tablets. Carry out the assay as described under ftivazide, using an accurately weighed quantity of the powder equivalent to about 0.2 g of ftivazide.

Category As described under ftivazide.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Furosemide

$C_{12}H_{11}ClN_2O_5S$ 330.75

Furosemide is 5-(aminosulfonyl)-4-chloro-2 [(2-furanylmethyl) amino]-benzoic acid. It contains not less than 99.0% of $C_{12}H_{11}ClN_2O_5S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; almost tasteless. Soluble in acetone; sparingly soluble in ethanol; insoluble in water.

Melting range 206-210°C, with decomposition (Appendix VI C).

Specific absorbance Dissolve an accurately weighed quantity in 0.4% sodium hydroxide solution to produce a solution of 10 µg per ml. Measure the absorbance at 271 nm (Appendix IV A), the value of A (1%, 1 cm) is 565-595.

Identification (1) To about 25 mg add 5 ml of water, add sodium hydroxide TS dropwise to just dissolved, add 1-2 drops of copper sulfate TS, a green precipitate is produced. (2) Dissolve 25 mg in 2.5 ml of ethanol in a test tube, add 2 ml of dimethylaminobenzaldehyde TS, dropwise, along the wall of test tube; a green colour is produced and becomes deep red gradually.

(3) The light absorption of a 5 µg per ml solution in 0.4% sodium hydroxide solution exhibits maxima at 228 nm and 271 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV A) is concordant with the reference spectrum of furosemide (Appendix XVI).

Clarity and colour of alkaline solution Dissolve 0.50 g in 5 ml of sodium hydroxide TS, add 5 ml of water, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B); any colour produced is not more intense than that of reference solution Y₃ (Appendix IX A, method 1).

Chlorides Shake 2.0 g with 100 ml of water thoroughly and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate obtained in the test for chlorides. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.04%).

Aromatic primary amine Dissolve 0.10 g in methanol in a 25 ml volumetric flask, add methanol to volume, shake thoroughly. Measure accurately 1 ml to another 25 ml

volumetric flask, add 3 ml of dimethylformamide, 12 ml of water and 1 ml of hydrochloric acid (1 mol/L) VS, mix well and cool. Add 1 ml of 0.5% sodium nitrite solution, mix well, allow to stand for 5 minutes. Add 1 ml of 2.5% sulfamic acid, mix well and allow to stand for 5 minutes. Add 1 ml of a 0.5% solution of *N*-(1-naphthyl)-ethylenediamine dihydrochloride in dilute ethanol and sufficient water to volume, mix well, allow to stand for 10 minutes. The absorbance of the resulting solution at 530 nm (Appendix IV A) is not greater than 0.12.

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Not more than 0.002% (Appendix VIII H, method 3), using 0.50 g.

Arsenic Mix 1.0 g with 1 g of calcium hydroxide and a small quantity of water, heat gently at first, then ignite at higher temperature until cineration complete, cool, add 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); complies with the requirements (0.0002%).

Assay Dissolve about 0.5 g, accurately weighed, in 30 ml of ethanol with warming, cool, add 4 drops of cresol red IS and 1 drop of bromothymol blue IS. Titrate with sodium hydroxide (0.1 mol/L) VS until a purple colour is obtained. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 33.07 mg of $C_{12}H_{11}ClN_2O_5S$.

Category Diuretic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Furosemide Injection
(2) Furosemide Tablets
(3) Compound Furosemide Tablets

Furosemide Injection

Furosemide Injection is a sterile solution of furosemide in water for Injection containing sodium hydroxide and sodium chloride. It contains not less than 90.0% and not more than 110.0% of the labelled amount of furosemide ($C_{12}H_{11}ClN_2O_5S$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the tests (1), (2) and (3) for Identification described under Furosemide.

pH value 8.5-9.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 2 ml to a 100 ml volumetric flask, add 0.4% sodium hydroxide solution to volume, mix well. Measure accurately 5 ml of the diluted solution to another 100 ml volumetric flask, add 0.4% sodium hydroxide solution to volume, mix well. Measure the absorbance of the solution at 271 nm (Appendix IV A). Calculate the content of $C_{12}H_{11}ClN_2O_5S$, taking 580 as the value of *A* (1%, 1 cm).

Category As described under Furosemide.

Strength 2 ml:20 mg

Storage Preserve in tightly closed containers, protected from light.

Furosemide Tablets

Furosemide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of furosemide ($C_{12}H_{11}ClN_2O_5S$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to about 80 mg of furosemide in 10 ml of ethanol with shaking, filter and evaporate the filtrate to dryness. The residue complies with tests (1), (2) and (3) for Identification described under Furosemide.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of phosphate BS (pH 5.8) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, measure 5 ml of the successive filtrate and dilute with 0.8% sodium hydroxide solution to 10.0 ml, mix well. Measure the absorbance of the resulting solution at 271 nm (Appendix IV A). Calculate the dissolution of $C_{12}H_{11}ClN_2O_5S$ from each tablet, taking 580 as the value of *A* (1%, 1 cm), not less than 65% for the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 20 mg of furosemide into a 100 ml volumetric flask, add about 60 ml of 0.4% sodium hydroxide solution, shake for 10 minutes. Add 0.4% sodium hydroxide solution to volume, mix well and filter, measure accurately 5 ml of successive filtrate in another 100 ml volumetric flask, dilute with 0.4% sodium hydroxide solution to volume, mix well. Measure the absorbance at 271 nm (Appendix IV A). Calculate the content of $C_{12}H_{11}ClN_2O_5S$, taking 580 as the value of *A* (1%, 1 cm).

Category As described under Furosemide.

Strength 20 mg

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Compound Furosemide Tablets

Compound Furosemide Tablets contain 18.0-22.0 mg of furosemide ($C_{12}H_{11}ClN_2O_5S$) and 2.25-2.75 mg of Amiloride Hydrochloride ($C_6H_8ClN_7O \cdot HCl$) in each tablet.

Formula	Furosemide	20 g
	Amiloride Hydrochloride	2.5 g
	Excipient	a quantity
	to make	1000 tablets

Description Almost white to pale yellow tablets.

Identification (1) To a quantity of powdered tablets (equivalent to about 80 mg of furosemide), add 10 ml of ethanol, shake to dissolve furosemide and amiloride hydrochloride, filter, evaporate the filtrate to dryness. The

residue complies with the test; ① Dissolve about 25 mg of the residues with 2.5 ml of ethanol in the test tube, add to 2 ml of *p*-dimethylaminobenzaldehyde TS along the inner wall of the test tube, a green colour is produced, then turn to red. ② Dissolve about 20 mg of the residues with 20 ml of water, add dropwise excessive nitric acid to precipitate completely, filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

(2) The retention time of principal peaks of the furosemide and Amiloride Hydrochloride in the substance being examined in the chromatogram obtained in the Assay are identical with that the principal peaks of furosemide CRS and Amiloride Hydrochloride CRS in the chromatogram of the reference solution corresponding.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Place 1 tablet in a 100 ml volumetric flask, add 10 ml of methanol and 2 ml of hydrochloric acid (0.1 mol/L) solution, shake to dissolve furosemide and amiloride hydrochloride, dilute with mobile phase to volume, mix well and filter, use the successive filtrate as the test solution. Carry out the procedure as described under the Assay of furosemide and amiloride hydrochloride. Calculate the content of $C_{12}H_{11}ClN_2O_5S$ and $C_6H_8ClN_7O \cdot HCl$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of phosphate BS (pH 5.8) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exact 30 minutes and filter, as the test solution. Transfer 5 ml of the reference solution as described under the assay to a 50 ml volumetric flask, accurately measured, dilute with the dissolution medium to volume, mix well. Carry out the procedure as described under the assay of furosemide and amiloride hydrochloride, calculate the dissolution of $C_{12}H_{11}ClN_2O_5S$ and $C_6H_8ClN_7O \cdot HCl$ from each tablet, Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (Dissolve about 13.6 g of potassium dihydrogen phosphate with 80 ml of water in a 100 ml volumetric flask, adjust pH value to 3.0 with phosphoric acid, dilute with water to volume and mix well)-methanol-water (1:49:50) as mobile phase. Detection wavelength is 286 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of furosemide. The resolution factor between the peaks of furosemide and amiloride hydrochloride complies with the related requirements.

Procedure Weigh and powder 20 tablets. Triturate an accurately weighed quantity of powder equivalent to about 40 mg of furosemide and 5 mg of amiloride hydrochloride into a 200 ml volumetric flask, add 15 ml of methanol and 2 ml of 0.1 mol/L hydrochloric acid solution, ultrasonicate for 15 minute, cool, dilute with the mobile phase to volume, shake well, filter and inject 10 μ l of the successive filtrate into the column. Repeat the operation, using furosemide CRS and amiloride hydrochloride CRS instead of the substance being examined, calculate the content of $C_{12}H_{11}ClN_2O_5S$ and $C_6H_8ClN_7O \cdot HCl$.

Category Diuretic.

Storage Preserve in tightly closed containers, protected from light.

Gadopentetate Dimeglumine Injection

$C_{14}H_{20}GdN_3O_{10} \cdot 2C_7H_{17}NO_5$ 938.01 [86050-77-3]

Gadopentetate Dimeglumine Injection is a sterile solution of meglumine gadopentetate and an equal molecule of meglumine in water for injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of Gadopentetate Dimeglumine ($C_{14}H_{20}GdN_3O_{10} \cdot 2C_7H_{17}NO_5$).

Description A clear, colourless to pale yellow or light yellowish-green liquid.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram of the Assay is identical with that of gadopentetate dimeglumine CRS.

(2) Dilute 5 ml with water to produce 25 ml, mix well. The light absorbance of the solution exhibits a maximum at 275 nm (Appendix IV A).

Specific optical rotation -4.7° to -5.5° (Appendix VI E).

pH value 6.5-8.0 (Appendix VI H).

Colour Not more intense than reference solution Y_4 or YG_4 (Appendix IX A, method 1).

Pentetic acid Transfer accurately 5 ml to a conical flask, add 25 ml of water, 10 ml of acetic acid-sodium acetate BS [using acetic acid-sodium acetate (pH 4.5) BS, adjust pH to 5.0 with sodium hydroxide TS], add 0.5 ml of xylenol orange IS, titrate with gadolinium chloride (0.002 mol/L) VS (dissolve about 0.53 g of gadolinium chloride accurately weighed in water and dilute to 1000 ml) until the solution turns from orange-yellow to orange-red. Perform a blank determination and make any necessary correction. Each ml of gadolinium chloride (0.002 mol/L) VS is equivalent to 0.788 mg of $C_{14}H_{23}N_3O_{10}$. It contains not less than 50 μ g and not more than 400 μ g of pentetic acid per ml.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 3 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a solution of tetrabutylammonium perchlorate (dissolve 1.7 g of tetrabutylammonium perchlorate in 100 ml of acetonitrile, dilute to 1000 ml with water) as mobile phase. Detection wavelength is 195 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of meglumine gadopentetate.

Procedure Measure accurately 2 ml of the injection to a 200 ml volumetric flask, dilute with water to volume, mix well, measure accurately 15 ml of the solution to a 100 ml volumetric flask, dilute with water to volume, mix well.

Inject 20 μl of the resulting solution into the column, record the chromatogram. Dissolve a quantity of meglumine gadopentetate CRS with water to produce a solution of 0.6 mg per ml. Inject 20 μl of the resulting solution into the column, calculate the content of $\text{C}_{14}\text{H}_{20}\text{GdN}_3\text{O}_{10} \cdot 2\text{C}_7\text{H}_{17}\text{NO}_5$ with respect to the peak area obtained in the chromatogram by the external standard method. Multiply the result by 1.263.

Category Diagnostic agent.

Strength Calculated as gadopentetate dimeglumine ($\text{C}_{14}\text{H}_{20}\text{GdN}_3\text{O}_{10} \cdot 2\text{C}_7\text{H}_{17}\text{NO}_5$)

- (1) 10 ml : 4.69 g (2) 12 ml : 5.63 g
(3) 15 ml : 7.04 g (4) 20 ml : 9.38 g

Storage Preserve in well closed containers, protected from light.

Galanthamine Hydrobromide

$\text{C}_{17}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$ 368.27

[1953-04-4]

Galanthamine Hydrobromide is 4 α ,5,9,10,11,12-hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3*a*,3,2-*ef*][2] benzazepin-6-ol hydrobromide. It contains not less than 98.0% of $\text{C}_{17}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste bitter.

Soluble in water; slightly soluble in ethanol; insoluble in acetone, chloroform, ether or benzene.

Specific absorbance Measure the absorbance of a solution of 50 μg per ml in water at 289 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 79.6-86.2.

Identification (1) Transfer about 1 mg to a porcelain evaporating dish, add 1 ml of 0.5% ammonium molybdate solution, evaporate to dryness on a water bath and add 1-2 drops of sulfuric acid, a bluish-green colour is produced. (2) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Clarity of solution A solution of 0.10 g in 10 ml of freshly boiled and cooled water is clear.

Acidity pH 4.5-6.5 (Appendix VI H), using the solution obtained under the test for clarity of solution.

Other alkaloids To 0.10 g each of the substance being examined and galanthamine hydrobromide CRS, add separately 2 drops of ammonia TS and a quantity of methanol to produce 10 ml as the test solution and the reference solution respectively. Carry out the method for thin-layer chromatography (Appendix V B), using aluminium oxide (alkaline, grade III-IV) as the coating substance and ether as the mobile phase. Apply separately to the plate 10 μl each of the two solutions. After developing and removal of the plate, expose it in iodine vapour. The number of spots in the chromatogram obtained with the test solution is not more than those obtained with the reference solution, and the

colour of the secondary spots is not more intense than the corresponding spots obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 36.83 mg of $\text{C}_{17}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$.

Category Anticholinesterase agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Galanthamine Hydrobromide Injection

Galanthamine Hydrobromide Injection

Galanthamine Hydrobromide Injection is a sterile solution of galanthamine hydrobromide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of galanthamine hydrobromide ($\text{C}_{17}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$).

Description A clear, colourless liquid.

Identification Complies with test (1) for Identification described under Galanthamine Hydrobromide.

pH value 4.5-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute a quantity equivalent to about 5 mg of galanthamine hydrobromide with water to produce a solution of 50 μg per ml, mix well. Measure the absorbance at 289 nm (Appendix IV A). Calculate the content of $\text{C}_{17}\text{H}_{21}\text{NO}_3 \cdot \text{HBr}$, taking 82.9 as the value of *A* (1%, 1 cm).

Category As described under Galanthamine Hydrobromide.

Strength (1) 1 ml : 1 mg (2) 1 ml : 2.5 mg
(3) 1 ml : 5 mg

Storage Preserve in well closed containers, protected from light.

Gallium [^{67}Ga] Citrate Injection

Gallium [^{67}Ga] Citrate Injection is a sterile solution of Gallium [^{67}Ga] Citrate without carrier. It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of Gallium-67 at the date and hour stated on the label.

Description A clear, colourless liquid.

Identification (1) Carry out the γ -ray spectrum method (Appendix XIII) using sufficient of sample, the most prominent photons have energies of 0.093, 0.185 and 0.300 MeV. Carry out the determination of measurement of half-life method (Appendix XIII), 74.4-82.2 hours.

(2) The principal spot obtained in the determination of

Radiochemical purity has prominent radioactive peaks with R_f value of 0.90.

pH value 6.0-7.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E) using suitable amount of sample, diluted to at least 100 times of its original volume with water BET. It contains less than 15 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H).

Radionuclidic purity Carry out the determination of radionuclidic purity (Appendix XIII), not less than 99% of the radionuclide due to Ga-67, not more than 0.2% of the radionuclide due to Ga-66.

Radiochemical purity Carry out the determination of radiochemical purity (Appendix XIII, method 1), using sodium acetate-glacial acetic acid (Dissolve 1.36 g of sodium acetate and 0.58 ml of glacial acetic acid with water in a 100 ml volumetric flask, mix well) as the mobile phase. Not less than 95% of the total radioactivity is found in the spot corresponding to gallium [^{67}Ga] citrate.

Radioactive concentration Not less than 37 MBq per ml (Appendix XIII).

Category Diagnostic agent.

Strength (1) 185 MBq (2) 370 MBq (3) 740 MBq

Storage Preserve in tightly closed lead containers, the intensity of radiation on the surface of the container complies with relevant regulation.

Ganciclovir

$\text{C}_9\text{H}_{13}\text{N}_5\text{O}_4$ 255.21

Ganciclovir is 9-[(1,3-dihydroxy-2-propyloxy)methyl] guanine. It contains not less than 99.0% of $\text{C}_9\text{H}_{13}\text{N}_5\text{O}_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; tasteless, hygroscopic. Slightly soluble in water or glacial acetic acid, practically insoluble in methanol, insoluble in chloroform, sparingly soluble in hydrochloric acid solution and sodium hydroxide solution.

Specific absorbance Measure the absorbance of a solution of 10 μg per ml in water at 252 nm (Appendix IV A), the value of A (1%, 1 cm) is 516-548.

Identification (1) The light absorption of a solution of 10 μg per ml in water exhibits maximum at 252 nm, and minimum at 222 nm.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ganciclovir CRS. If necessary, dissolve a quantity of the substance being examined and ganciclovir CRS respectively in water to produce a saturated solution, filter, allow the filtrate to stand below 10°C for one night until the crystals appeared, filter and dry the crystals at 105°C, then perform the

determination (Appendix XVI)

Related substances Dissolve about 15 mg, accurately weighed, in 1 ml of 0.4% sodium hydroxide solution, dilute with the mobile phase to volume in a 50 ml volumetric flask and mix well as the test solution, transfer 1 ml of the solution into a 100 ml volumetric flask, accurately measured, dilute with the mobile phase to volume and mix well as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (5 : 95) as the mobile phase. Detection wavelength is 252 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ganciclovir. Inject 20 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-15% full scale of the chart. Inject separately 20 μl each of the solutions into the column, record the chromatograms for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all peaks other than the principal peak is not more than the area of the principle peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay To about 0.15 g, accurately weighed, add 40 ml of glacial acetic acid, heat to dissolve and allow to cool, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.52 mg of $\text{C}_9\text{H}_{13}\text{N}_5\text{O}_4$.

Category Antiviral.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ganciclovir and Sodium Chloride Injection
(2) Ganciclovir for Injection

Ganciclovir and Sodium Chloride Injection

Ganciclovir and Sodium Chloride Injection is a sterile solution of ganciclovir and sodium chloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $\text{C}_9\text{H}_{13}\text{N}_5\text{O}_4$, and it contains not less than 95.0% and not more than 105.0% of the labelled amount of NaCl.

Description A clear, colourless liquid.

Identification (1) Evaporate a quantity equivalent to about 20 mg of ganciclovir to dryness on a water bath, cool, add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, and evaporate to dryness on a water bath. To the residue add several drops of ammonia TS, a purple-reddish colour is produced immediately, add several drops of sodium hydroxide TS, the purple-reddish colour disappears.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is

identical with that of ganciclovir CRS in the chromatogram of the reference solution.

(3) Yields the flame reaction of sodium salts and the reaction characteristic of chlorides (Appendix III).

pH value 7.0-8.0 (Appendix VI H).

Related substances Dilute a quantity with mobile phase to produce a solution containing 0.3 mg of ganciclovir per ml as the test solution. Carry out the method described under ganciclovir. In the chromatogram obtained with the test solution, the sum of the areas of all peaks other than the principal peak is not more than the area of the peak in the chromatogram obtained with reference solution.

Heavy metals Evaporate 50 ml to about 20 ml and cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.00003%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Ganciclovir Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (5 : 95) as the mobile phase. Detection wavelength is 252 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of ganciclovir.

Procedure Dilute an accurately measured quantity of the injection with mobile phase to produce a solution containing 40 µg of ganciclovir per ml as test solution. Transfer about 25 mg of ganciclovir CRS, accurately weighed, to a 25 ml volumetric flask, add 1 ml of 0.4% sodium hydroxide solution, dilute with the mobile phase to volume, mix well, dilute a quantity with mobile phase to produce a solution containing 40 µg of ganciclovir CRS per ml as reference solution. Inject separately 20 µl each of the reference solution and the test solution into the column. Calculate the content of $C_9H_{13}N_5O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Sodium Chloride To 10 ml, accurately measured, add 40 ml of water, 5 ml of dextrin solution (1→50), 0.1 g of calcium carbonate and 5-8 drops of fluorescein IS and titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category As described under Ganciclovir.

Strength (1) 100 ml : Ganciclovir 0.05 g, Sodium Chloride 0.9 g
(2) 250 ml : Ganciclovir 0.25 g, Sodium Chloride 2.25 g

Storage Preserve in well closed containers.

Ganciclovir for Injection

Ganciclovir for Injection is a sterile, lyophilized preparation of ganciclovir and a quantity of sodium hydroxide. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_9H_{13}N_5O_4$.

Description A white, lyophilized mass or powder; hygroscopic.

Identification (1) To about 20 mg, add 2 ml of hydrochloric

acid and evaporate to dryness on a water bath, add 1 ml of hydrochloric acid and 30 mg of potassium chlorate, and evaporate to dryness on a water bath. To the residue add several drops of ammonia TS, a purple-reddish colour is produced immediately, add several drops of sodium hydroxide TS, purple-reddish colour is disappeared.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ganciclovir CRS.

(3) Dissolve a quantity of the substance being examined in water, neutralize with dilute hydrochloric acid or ammonia TS, a white precipitate is produced, filter, the filtrate yields the flame reaction of sodium salts (Appendix III).

Alkalinity Dissolve a quantity in water to produce a solution of 12.5 mg per ml, pH 10.5-11.5 (Appendix VI H).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Clarity of solution A solution of 10 mg per ml in water is clear; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Related substances Dilute a quantity with mobile phase to produce a solution containing 0.3 mg of ganciclovir per ml as test solution. Carry out the method described under Ganciclovir. In the chromatogram obtained with the test solution, the sum of the areas of all peaks other than the principal peak is not more than the area of the principle peak in the chromatogram obtained with the reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.5 EU per mg of ganciclovir.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method), dissolving in suitable volume of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 5 containers with mobile phase, combine the solution and mix well. Dilute with mobile phase to produce a solution containing 40 µg of ganciclovir per ml as test solution. Carry out the Assay described under Ganciclovir and Sodium Chloride Injection.

Category As described under Ganciclovir.

Strength (1) 0.05 g (2) 0.15 g (3) 0.25 g (4) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Gelatin

Gelatin is obtained by the partial hydrolysis of animal collagen in the skin, bone, tendon and ligament.

Description Pale yellow to yellow, translucent and faintly lustrous granules or thin sheets; odourless. Easily decomposed by microorganisms when moistened. Swells and softens when immersed in water for a long duration, its weight increases gradually five to ten times due to the absorption of water.

Soluble in hot water, acetic acid or a hot mixture of glycerol and water; insoluble in ethanol, chloroform or ether.

Identification (1) Dissolve 0.5 g in 50 ml of water by heating. To 5 ml of the solution add a few drops of a mixture of potassium dichromate TS and dilute hydrochloric acid (4 : 1), an orange flocculent precipitate is produced.

(2) To 1 ml of the solution obtained in Identification (1), add 100 ml of water, mix well, add a few drops of tannic acid TS, an opalescence is produced.

(3) Heat with soda lime, an ammoniacal odour is perceptible.

Acidity Shake to dissolve 1.0 g in 100 ml of hot water, cool to 35°C, pH 3.6-7.6 (Appendix VI H).

Transparency Soak 5.0 g in 90 ml of water, allow to swell and heat in a water bath at 65-70°C, cool and add water to produce 100 ml. Transfer 5 ml to a 25 ml Nessler cylinder, any opalescence produced is not more pronounced than that of the same volume of reference solution (Transfer accurately 30 ml of standard sodium chloride solution to a 50 ml volumetric flask, add 1 ml each of nitric acid and silver nitrate TS, dilute to volume with water, allow to stand in the dark for 5 minutes, match the colour with caramel solution if necessary), compare immediately.

Sulfite Soak 20 g in a long neck round-bottomed flask in 50 ml of water and allow to swell. Add 50 ml of dilute sulfuric acid, connect a condenser immediately and distill with steam. Receive the distillate in 20 ml of hydrogen peroxide TS (previously neutralized to methyl red-methylene blue IS), until 80 ml are collected. Stop distillation, to the distillate add a few drops of methyl red-methylene blue IS, not more than 1.0 ml of sodium hydroxide (0.1 mol/L) VS is required to change the colour to grass green. Perform a blank determination and make any necessary correction.

Loss on drying Transfer about 1 g to a stainless steel or aluminium vessel (about 75 mm in diameter) previously dried to constant weight at 105°C, weigh accurately. Add 10 ml of water and allow to swell. Heat on a water bath and evaporate to dryness, dry to constant weight at 105°C, loses not more than 16.0% of its weight (Appendix VIII L).

Ash Ignite gently 1.0 g, accurately weighed, in a crucible (previously ignited to constant weight) until completely charred, raise the temperature gradually to 600-700°C, incinerate completely to constant weight, the residue is not more than 2.0%.

Heavy metals To the residue obtained in the determination of Ash add 2 ml of hydrochloric acid and 0.5 ml of nitric acid, evaporate to dryness on a water bath. Add 5 ml of acetate BS (pH 3.5) and 20 ml of water, warm for a few minutes, add water to produce 50 ml. To 20 ml of the solution, add 5 ml of water. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.002%.

Arsenic To 1.0 g add 0.5 g of starch, 1.0 g of calcium hydroxide and a small quantity of water, mix well. Dry and ignite slowly until completely charred, incinerate to carbon-free at 500-600°C, allow to cool, dissolve the residue in 8 ml of hydrochloric acid and 20 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0002%.

Gel strength Transfer 1.10 g to a tared conical flask, add 80 ml of water, allow to stand for 2 hours at 15-18°C to swell completely. Heat in a 60°C water bath to dissolve. Allow the solution to cool and add a quantity of water to produce 100 g. Transfer 10 ml of the solution to a test tube of 13 mm in internal diameter, freeze for 6 hours in an ice bath at 0°C. Allow the tube to be inverted for 10 seconds, nothing falls out of the tube.

Microbial limit Carry out the microbial limit test (Appendix XI J), besides that number of bacterial is not more than 1000 and that of yeasts is not more than 100 per g, *Escherichia coli* is absence.

Category Absorbable hemostatic.

Storage Preserve in well closed containers and stored in a dry place.

Preparation Absorbable Gelatin Sponge

Absorbable Gelatin Sponge

Absorbable Gelatin Sponge is obtained by dissolving gelatin in water and the solution is lyophilized and finally sterilized.

Description A white or pale yellow, light, soft, spongy material, water absorbable. Not damaged even on fairly hard kneading.
Insoluble in water.

Absorptivity Immerse a cube (1 cm × 1 cm × 0.5 cm) of the sponge, accurately weighed, in water at 20°C, knead gently until enough water is absorbed, take care not to damage the cube, withdraw from the water by means of small forceps, allow to drain for one minute while lightly held in the forceps, and then weigh accurately. The increase in weight is not less than 35 times of its original weight.

Residue on ignition Not more than 2.0%, using 0.1 g (Appendix VIII N).

Sterility Comply with the requirement for sterility (Appendix XI H).

Category As described under Gelatin.

Strength (1) 2 cm × 2 cm × 0.5 cm
(2) 6 cm × 2 cm × 0.5 cm
(3) 6 cm × 6 cm × 1 cm
(4) 8 cm × 6 cm × 0.5 cm

Storage Preserve in hermetically sealed containers.

Gemfibrozil

$C_{15}H_{22}O_3$ 250.34

[25812-30-0]

Gemfibrozil is 2,2-dimethyl-5-(2,5-xylyloxy) valeric acid. It contains not less than 98.0% and not more than 102.0% of $C_{15}H_{22}O_3$, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; tasteless. Very soluble in chloroform; freely soluble in methanol, ethanol, acetone or hexane; insoluble in water; freely soluble in sodium hydroxide TS.

Melting range 58-61°C (Appendix VI C).

Identification (1) Dissolve about 50 mg in 3 ml of ethanol. To 5 drops of the solution, add 2 drops of each of a 2% potassium iodide solution and a 4% potassium iodate solution, heat on a water bath for 1 minute, cool and add 2 drops of starch IS; a blue colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of gemfibrozil

(Appendix XVI).

Related substances Carry out the method as described under the Assay. Dissolve a quantity of the substance being examined in the mobile phase to produce a solution containing 10 mg per ml and use this solution as a test solution. Dilute a quantity of the solution, accurately measured, with the mobile phase to produce a solution containing 0.2 mg per ml and use this solution as a reference solution. Inject 50 μ l of each of the two solutions, accurately measured, into the column, and record the chromatogram for twice of the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution; the maximum area of all the peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than 10% of the area of the principal peak in the chromatogram obtained with the reference solution.

Water Not more than 0.25% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-glacial acetic acid (75 : 24 : 1) as the mobile phase. Detection wavelength is 276 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of gemfibrozil.

Procedure Dissolve a quantity, accurately weighed, in the mobile phase to produce a solution containing 0.2 mg per ml. Inject 10 μ l of the resulting solution, accurately measured, into the column, and record the peak area correspondingly obtained in the chromatogram. Repeat the operation using gemfibrozil CRS instead. Calculate the content of $C_{15}H_{22}O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Hypolipidaemic.

Storage Preserve in tightly closed containers.

Preparation Gemfibrozil Capsules

Gemfibrozil Capsules

Gemfibrozil Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Gemfibrozil ($C_{15}H_{22}O_3$).

Description Capsules containing a white powder.

Identification (1) Shake a quantity of the contents, equivalent to about 60 mg of Gemfibrozil, with 3 ml of ethanol and filter. The filtrate complies with the test (1) for the Identification described under Gemfibrozil.

(2) Shake a quantity of the contents, equivalent to about 100 mg of Gemfibrozil, with 10 ml of 0.1 mol/L sodium hydroxide solution and filter. Transfer the filtrate to a centrifuge tube, acidify with dilute sulfuric acid until a precipitate is formed, centrifuge and discard the supernatant liquid. Wash the precipitate with a small quantity of water in portions and filter under reduced pressure. Dry the

precipitate over silica gel for 12 hours. The infrared absorption spectrum of the residue (Appendix IV C) is concordant with the reference spectrum of gemfibrozil (Appendix XVI).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of phosphate buffer (dissolve 27.22 g of potassium dihydrogen phosphate and 5.52 g of sodium hydroxide in water to produce 1000 ml, adjust to pH 7.5 and shake thoroughly) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute a quantity of successive filtrate, accurately measured, with 1 mol/L sodium hydroxide solution to produce a solution containing about 70 μ g per ml. Dissolve a quantity of gemfibrozil CRS, accurately weighed, in 1 mol/L sodium hydroxide solution to produce a solution containing 70 μ g per ml. Measure the absorbances of the resulting solutions at 276 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{22}O_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To an accurately weighed quantity of the mixed contents in the test for Weight variation, equivalent to about 50 mg of Gemfibrozil, in a 50 ml volumetric flask, add the mobile phase described in the Assay under Gemfibrozil to dissolve gemfibrozil and dilute with the mobile phase to volume, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 25 ml volumetric flask, dilute with the mobile phase to volume. Carry out the Assay described under gemfibrozil beginning at the words "Inject 10 μ l of the resulting solution, accurately measured, into the column...". Calculate the content of $C_{15}H_{22}O_3$.

Category As described under Gemfibrozil.

Strength (1) 0.15 g (2) 0.3 g

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Gentamycin Sulfate

[1405-41-0]

Gentamycin Sulfate has a potency of not less than 590 Gentamycin Units per mg, calculated on the anhydrous basis.

Description A white or almost white powder; odourless; hygroscopic. Freely soluble in water; insoluble in ethanol, acetone, chloroform or ether.

Specific optical rotation $+107^\circ$ to $+121^\circ$, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 5 mg in 1 ml of water, add 1 ml of 0.1% ninhydrin in *n*-butanol saturated with water and 0.5 ml of pyridine, heat in a water bath for 5 minutes; a purplish-blue is immediately produced.

(2) Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform-methanol-ammonia solution (1 : 1 : 1) (stand for 1 hour) as the mobile phase. Activate the plate at 105°C for 2 hours, apply separately to the plate 2 μ l each of two solutions in water containing (1) 20 mg per ml of the substance being examined and (2) 20 mg per ml of gentamicin RS. After developing and removal of the plate, allow to dry at $20-25^\circ\text{C}$

and expose it to iodine vapor. The colour and position of the principal spots in the chromatogram obtained with solution (1) correspond to that of principal spots obtained with solution (2).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of gentamycin sulfate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity An aqueous solution of 40 mg per ml, pH 4.0-6.0 (Appendix VI H).

Clarity and colour of solution To 5 portions add water respectively to produce solutions of 80 mg per ml, the solutions are clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Sulfates Dissolve 0.125 g, accurately weighed, in 100 ml of water and adjust the solution to pH 11 with concentrated ammonia solution. Add accurately 10.0 ml of 0.1 mol/L barium chloride VS and five drops of phthalein purple IS. Titrate with 0.05 mol/L disodium edetate (Notice: keep the pH value at 11 during the titration) until the colour of the solution begins to change, add 50 ml of alcohol and continue the titration until the violet-blue colour disappear. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of SO₄, not less than 32.0% and not more than 35.0%, calculated on the anhydrous basis.

Water Not more than 15.0% (Appendix VIII M A, method 1).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 0.5 EU per 1000 Gentamycin Units.

Gentamicin C components Carry out the method for high-performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (pH adaptive value is within 0.8-8.0) and a mixture of 0.2 mol/L trifluoroacetic acid-methanol (92 : 8) as the mobile phase. The flow rate is 0.6 ml per minute. The temperature of the drift tube of evaporative light-scattering detector (ELSD) is at 110°C, the flow rate of the carrier gas is 2.8 L per minute and impactor is off (these parameters can be adjusted if necessary). Dissolve an amount of gentamycin CRS and micronomicin CRS in water to obtain a solution containing 0.2 mg each of the two substances per ml. Inject 10 µl of the solution into the column. The elution order of the five major components in the chromatogram from the second peak is C_{1a}, C₂, micronomicin, C_{2a}, C₁ respectively. The resolution factors among the peaks of C₂, micronomicin and C_{2a} comply the related requirements. The relative standard deviation (RSD) of the areas of micronomicin for replicate injections is less than 2.0%.

Procedure Dissolve about 20, 50, 100 mg of micronomicin CRS, accurately weighted, with the mobile phase to volume in three 100 ml volumetric flasks respectively as reference solution (1), (2), (3). Inject 20 µl each of the three solutions into the column. Based on the corresponding concentrations (C) and areas (A) of micronomicin in reference solution (1), (2), (3), the linear regression equation of logA versus logC can be determined. The correlation coefficient (r) of the regression equation should be greater than 0.99. Dissolve a quantity of the substance

being examined, accurately weighted, in the mobile phase to produce solutions of 2.5 mg of gentamycin per ml. Inject 20 µl of the solution into the column. Calculate the corresponding concentrations of gentamycin C components (X_{C_{1a}}, X_{C₂}, X_{C_{2a}}, X_{C₁}) with respect to the regression equation of micronomicin and the corresponding peak areas of C_{1a}, C₂, C_{2a}, C₁ in the chromatogram of the substance being examined. The ratio of gentamycin C components was calculated based on the following formula:

$$C_x(\%) = \frac{X_{C_x}}{X_{C_{1a}} + X_{C_2} + X_{C_{2a}} + X_{C_1}} \times 100\%$$

where C_x (%) is the ratio of gentamycin C_x (C_{1a}, C₂, C_{2a}, C₁);

X_{C_x} is the corresponding concentrations of C_{1a}, C₂, C_{2a}, C₁.

C₁ is 25%-50%, C_{1a} is 15%-40%, C₂+C_{2a} is 20%-50%.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 1000 Units per ml and carry out the method for microbiological assay of antibiotics (Appendix XI A). The confidence-limit rate is not more than 7%. 1000 Units is equivalent to 1 mg of gentamycin.

Category Aminoglycoside antibiotics.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Gentamycin Sulfate Eye Drops
(2) Gentamycin Sulfate Granules
(3) Gentamycin Sulfate Injection
(4) Gentamycin Sulfate Sustained-release Tablets
(5) Gentamycin Sulfate Tablets

Gentamycin Sulfate Eye Drops

Gentamycin Sulfate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled potency of Gentamycin. It may contain suitable preservatives.

Description A clear, colourless liquid.

Identification Comply with the tests (1), (2) and (4) for Identification described under Gentamycin Sulfate.

pH value 5.0-7.0 (Appendix VI H).

Colour of solution The eye drops are colourless; any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Measure accurately a quantity and carry out the Assay described under Gentamycin Sulfate.

Category As described under Gentamycin Sulfate.

Strength 8 ml : 40000 Units

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Gentamycin Sulfate Granules

Gentamycin Sulfate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of gentamycin.

Description Soluble granules.

Identification (1) To a quantity of the powder add water to produce a solution of about 1 mg of gentamycin per ml. The solution complies with the test (1) for Identification described under Gentamycin Sulfate, using 1 ml.

(2) Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform-methanol-ammonia solution (1 : 1 : 1) as the mobile phase. Activate the plate at 105°C for 2 hours, apply separately to the plate 5 µl each of three solutions in water containing (1) 1 mg of gentamycin of the substance being examined per ml, (2) 1 mg of gentamycin of gentamycin RS per ml and (3) 1 mg of gentamycin each of the substance being examined and gentamycin sulfate RS per ml. After developing and removal of the plate, allow to dry at 20-25°C and expose it to iodine vapor. The number of the principal spots in the chromatogram obtained with solution (3) correspond to that of the principal spots obtained with solution (2); the number, colour and position of the principal spots in the chromatogram obtained with solution (1) correspond to that of the principal spots obtained with solution (3).
(3) Comply with test (3) for Identification described under Gentamycin Sulfate.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighed quantity of the mixed contents obtained in weight variation in sterile water to produce a solution of 100 Units per ml and carry out the Assay described under Gentamycin Sulfate.

Category As described under Gentamycin Sulfate.

Strength (1) 10 mg (10000 Units)
(2) 40 mg (40000 Units)

Storage Preserve in tightly closed containers, stored in a cool, dark and dry place.

Gentamycin Sulfate Injection

Gentamycin Sulfate Injection is a sterile aqueous solution of gentamycin sulfate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Gentamycin.

Description A clear, colourless or almost colourless liquid.

Identification Comply with the tests (1), (2) and (4) for Identification described under Gentamycin Sulfate.

pH value 3.5-6.0 (Appendix VI H).

Colour of solution The solution is colourless; any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, Method 1).

Sterility Transfer the samples to not less than 500 ml of 0.9% sterile sodium chloride solution. Carry out the test for sterility (Appendix XI H, membrane filtration method).

Bacterial endotoxin Comply with the corresponding requirements described under Gentamycin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Gentamicin C components Dilute an accurately measured

volume of the mixed sample solution ($n \geq 10$) with water to obtain a solution of 1.5 mg per ml, carry out the method described under Gentamycin sulfate, C_1 is 25%-50%, C_{1a} is 15%-40%, $C_{2a} + C_2$ is 20%-50%.

Assay Measure accurately a quantity and carry out the Assay described under Gentamycin Sulfate.

Category As described under Gentamycin Sulfate.

Strength (1) 1 ml : 20000 Units
(2) 1 ml : 40000 Units
(3) 2 ml : 80000 Units

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Gentamycin Sulfate Sustained-release Tablets

Gentamycin Sulfate Sustained-release Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of gentamycin.

Description White or almost white tablets.

Identification To a quantity of powdered tablets equivalent to about 40 mg of gentamycin, add 4 ml of water, shake thoroughly to dissolve and filter. The filtrate complies with the tests (1), (2) and (4) for Identification described under Gentamycin Sulfate.

Drug release Carry out the method for drug release (Appendix X D, method 1), using the equipment described under the dissolution test (Appendix X C, method 1) using 0.1 mol/L hydrochloric acid solution as the release medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 5 ml of the solution at exactly 2, 4 and 6 hours respectively, filter and supply 5 ml of the same release medium accordingly in the vessel immediately. Measure accurately 3 ml of the successive filtrate to a test tube with stopper, add 2.2 ml of isopropanol, 0.8 ml of phthalaldehyde TS, stopper tightly, mix well. Heat in a water bath at 60°C for 15 minutes and cool. Determine the absorption spectra of the resulting solution within the range of 300-400 nm (Appendix IV A) and transform it into first derivative spectra (a plot of the gradient of the absorption curve (rate of change of the absorbance with wavelength)). Measure the absorbance of first derivative spectra at the maximum peak valley within 350-360 nm. Dissolve an accurately weighed quantity of the 10 powdered tablets equivalent to about the average weight of one tablet in a quantity of 0.1 mol/L hydrochloric acid solution in a 500 ml volumetric flask, shake thoroughly, dilute to volume and mix well. Measure accurately 25 ml of the supernatant liquid to a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, and mix well. Filter, measure accurately 3 ml of the successive filtrate to a test tube with stopper as a reference solution, measure the absorbance in the same manner as the test solution. Calculate the content of gentamycin sulfate dissolved from each tablet at 2, 4 and 6 hours separately with respect to the absorption of first derivative spectra of the test solutions and that of the reference solution. The dissolution of gentamycin sulfate complies with the requirement; the quantity dissolved from each tablet is 45%-70%, 60%-80% and over 80% of the labelled amount at 2, 4 and 6 hour, respectively. If 1 tablet in 6 tablets at each test time fails to pass the test, but the average quantity dissolved lies in the specified range, it still complies with the requirement. If the amount of gentamycin sulfate dissolved from 1 tablet at last test time is less than

10% of the specified quantity, repeat the test with 6 further tablets. The average quantity dissolved from 12 tablets at each test time all lie in the specified range and not more than 2 of 12 tablets is less than 10% of the specified quantity at the last test time, it complies with the requirement.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.1 g of gentamycin. Add a quantity of sterile water, shake thoroughly to dissolve gentamycin sulfate, dilute to produce a suspension of about 1000 Units per ml, mix well and allow it to stand. Filter, measure accurately a quantity of the successive filtrate and carry out the Assay described under Gentamycin Sulfate.

Category As described under Gentamycin sulfate.

Strength 40 mg (40000 Units)

Storage Preserve in tightly closed containers, Stored in a dry place.

Gentamycin Sulfate Tablets

Gentamycin Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of gentamycin.

Description White tablets or sugar coated tablets.

Identification To a quantity of powdered tablets (equivalent to about 40 mg of gentamycin, with coating removed) add 2 ml of water, shake well and filter. The filtrate complies with the tests (1), (2) and (4) for Identification described under Gentamycin Sulfate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.1 g of gentamycin; or triturate 4 sugar coated tablets with sterile water, shake thoroughly. Dilute with sterile water to produce a suspension of about 1000 Units per ml, mix well and allow it to stand. Measure accurately a quantity of the supernatant and carry out the Assay described under Gentamycin Sulfate.

Category As described under Gentamycin Sulfate.

Strength (1) 20 mg (20000 Units)
(2) 40 mg (40000 Units)

Storage Preserve in tightly closed containers, protected from light and stored in a cool and dry place.

Glacial Acetic Acid

$C_2H_4O_2$ 60.05

[64-19-7]

Glacial Acetic Acid contains not less than 99.0% (g/g) of $C_2H_4O_2$.

Description A clear colourless liquid or colourless crystalline mass; odour, strong and characteristic.

Miscible with water, ethanol, glycerin or most of the volatile oils and fatty oils.

Congeeing point Not less than 14.8°C (Appendix VI D).

Identification (1) Mix 1 ml with 1 ml of water, neutralize with sodium hydroxide TS, add ferric chloride TS, a deep red colour is produced. Boil, a reddish-brown precipitate is produced which dissolves in hydrochloric acid to form a yellow solution.

(2) Heat a small quantity with a few ml of sulfuric acid and ethanol, an odour of ethyl acetate is produced.

Chloride Dilute 10 ml with 20 ml of water. Carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference using 4.0 ml of sodium chloride standard solution (0.0004%).

Sulfate To 20 ml add 1 ml of 1% anhydrous sodium carbonate solution, evaporate to dryness on a water bath. Carry out the limit test for sulfates (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of potassium sulfate standard solution (0.0005%).

Formic acid and readily oxidizable substances Dilute 5 ml with 10 ml of water. To 5 ml of the resulting solution add 2.5 ml of potassium dichromate (0.01667 mol/L) VS and 6 ml of sulfuric acid, allow to stand for 1 minute, add 20 ml of water, cool to 15°C, add 1 ml of potassium iodide TS, a deep yellow or brown colour is produced immediately.

Reducing substances To 2 ml add 10 ml of water and 0.10 ml of potassium permanganate (0.02 mol/L) VS, mix well, allow to stand for 30 minutes, the pink colour is not entirely discharged.

Non-volatile substances Evaporate 20 ml in a tared evaporating dish to dryness on a water bath, dry at 105°C to constant weight, the residue is not more than 1 mg.

Heavy metals Evaporate 10 ml to dryness on a water bath, add 2 ml of acetate BS (pH 3.5) and 15 ml of water, heat gently to dissolve, add a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0002%.

Assay Transfer about 2 ml to a tared conical flask with stopper. Weigh accurately, add 40 ml of freshly boiled and cooled water and 3 drops of phenolphthalein IS, titrate with sodium hydroxide (1 mol/L) VS. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 60.05 mg of $C_2H_4O_2$.

Category Corrosive.

Storage Preserve in tightly closed containers.

Glibenclamide

$C_{23}H_{28}ClN_3O_5S$ 494.01

[10238-21-8]

Glibenclamide is 1-{ 4-[2-(5-chloro-2-methoxybenzamido) ethyl] benzenesulfonyl}-3-cyclohexylurea.

It contains not less than 99.0% of $C_{23}H_{28}ClN_3O_5S$ calculated on the dried basis.

Description A white crystalline powder; almost odourless; tasteless.

Sparingly soluble in chloroform; slightly soluble in methanol or ethanol; insoluble in water or ether.

Melting range 170-174°C, with decomposition (Appendix VI C).

Identification (1) The light absorption of a 0.10 mg per ml solution in ethanol exhibits maxima at 274 and 300 nm, minima at 272 nm and 278 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glibenclamide (Appendix XVI).

(3) Mix 0.1 g with 0.2 g of potassium nitrate. Heat gently until it is thoroughly charred and then ignite until the incineration is complete, cool, add 10 ml of water to dissolve the residue and filter. The filtrate yields the reactions characteristic of chlorides and of sulfates (Appendix III).

Chloride Boil 1.0 g with 50 ml of water, cool rapidly, filter, add water to make the filtrate 50 ml. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the solution. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the solution obtained in the test for chloride. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.040%).

Related substances Dissolve 25 mg, weighed accurately, in a 25 ml volumetric flask with methanol with ultrasonication and dilute to volume with methanol, mix well. Measure accurately 5 ml to a 10 ml volumetric flask, dilute to volume with mobile phase, mix well as the test solution. Measure accurately 1 ml to a 200 ml volumetric flask; dilute to volume with mobile phase as the reference solution (1). Dissolve 15 mg of each of 4-[2-(5-chloro-2-methoxy-benzamido) ethyl] benzenesulfonamide CRS and 4-[2-(5-chloro-2-methoxy-benzamido) ethyl] benzenesulfonyl-*N*-methyl carbamate CRS, weighed accurately, in 10 ml methanol with ultrasonicate respectively, dilute with mobile phase to produce each of a solution of 3 µg per ml as reference solution (2) and (3). Detection wavelength is 300 nm. Carry out the method described under Assay, inject 20 µl of reference solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-15% of the full scale of the chart. Inject 20 µl of reference solution (1), (3) and test solution separately, record the chromatogram. Record the chromatogram of test solution for twice the retention time of the principal peak. The area of the peak obtained with test solution corresponding to the principal peak of reference solution (2) and (3) is not greater than the area of the principal peak in the chromatogram obtained with reference solution (2) and (3). The sum of the areas of all peaks other than the principal peak obtained with test solution is not greater than the area of the principal peak in the chromatogram obtained with reference solution (1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals

(Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition, not more than 0.001%.

Assay Carry out the method for high Performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. The mobile phase is methanol-ammonium dihydrogen phosphate solution (Dissolve 1.725 g of ammonium dihydrogen phosphate with water in a 300 ml volumetric flask, adjust pH 3.5 ± 0.05 with phosphate) (5 : 3). Detection wavelength is 274 nm, and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of glibenclamide and the resolution factor between peaks of glibenclamide and internal standard complies with the related requirements.

Internal standard solution Dissolve 10 mg of butyl *p*-hydroxybenzoate in 6 ml methanol in a 100 ml volumetric flask with ultrasonication, dilute to volume with mobile phase, mix well.

Procedure Dissolve about 20 mg of glibenclamide CRS, weighed accurately, in 12 ml of methanol in a 50 ml volumetric flask with ultrasonication, dilute to volume with mobile phase, mix well. Measure accurately 25 ml and 5 ml of the internal standard solution in a 50 ml volumetric flask, dilute to volume with mobile phase, mix well. Inject 20 µl into the column, record the chromatogram. Repeat the operation using 20 mg of the substance being examined instead of the glibenclamide CRS. Calculate the content of $C_{23}H_{28}ClN_3O_5S$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Hypoglycaemic.

Storage Preserve in tightly closed containers.

Preparation Glibenclamide Tablets

Glibenclamide Tablets

Glibenclamide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of glibenclamide ($C_{23}H_{28}ClN_3O_5S$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 10 mg of glibenclamide add a quantity of ethanol to dissolve glibenclamide and filter, dilute the filtrate with ethanol to 100 ml. The solution complies with test (1) for Identification described under Glibenclamide.

(2) A quantity of the powdered tablets equivalent to about 0.1 g of glibenclamide, complies with test (3) for Identification described under Glibenclamide.

Related substances Weigh accurately a quantity of the powdered tablets, equivalent to about 25 mg of glibenclamide, to a 25 ml volumetric flask, add a quantity of methanol, ultrasonicate to dissolve, dilute to volume with methanol and mix well. Filter, measure accurately 5 ml of the successive filtrate to a 10 ml volumetric flask, dilute to volume with mobile phase, mix well as the test solution. Measure accurately 1 ml in 100 ml volumetric flask, dilute to volume with mobile phase, mix well, carry out the test of related substances described under Glibenclamide, beginning at the words "as the reference solution (1)..."

Content uniformity Comply with the requirement (Appendix X E). Triturate 1 tablet with 40 ml of ethanol in portions and transfer to a 50 ml volumetric flask. Heat on a water bath for 10 minutes and shake to dissolve glibenclamide, cool to room temperature, dilute to volume with ethanol, mix well

and filter. Measure separately the absorbances of the successive filtrate at 300 nm and 340 nm (Appendix IV A), calculate the difference of the two absorbances as ΔA . Dissolve a quantity of glibenclamide CRS, measured accurately, in ethanol to produce a solution of about 50 μg per ml, and take the same operation above to get the ΔA , calculate the content of $\text{C}_{22}\text{H}_{29}\text{FO}_5$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of 0.02% trometamol as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter, using the successive filtrate as the test solution. Weigh accurately about 10 mg of glibenclamide CRS in a 100 ml volumetric flask, add 10 ml of ethanol, ultrasonicate to dissolve, dilute to volume with the dissolution medium and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute to volume with dissolution medium, mix well as the reference solution. Measure the absorbances of the resulting solutions at 225 nm (Appendix IV A), calculate the dissolution of $\text{C}_{23}\text{H}_{28}\text{ClN}_3\text{O}_5\text{S}$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 20 mg of glibenclamide to a 50 ml volumetric flask, add 12 ml of ethanol, sonicate to dissolve, add mobile phase and dilute to volume, mix well, filter, transfer 25 ml of successive filtrate and 5 ml of the internal standard in 50 ml volumetric flask with mobile phase and dilute to volume, mix well, Inject about 20 μl into the column, carry out the test for Assay described under Glibenclamide.

Category As described under Glibenclamide.

Strength 2.5 mg

Storage Preserve in well closed containers.

Gliclazide

$\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3\text{S}$ 323.41

[21187-98-4]

Gliclazide is 1-(3-Azabicyclo [3.3.0]-oct-3-yl)-3-(p-tolylsulfonyl) urea. It contains not less than 98.5% of $\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3\text{S}$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; tasteless.

Soluble in chloroform; sparingly soluble in methanol; slightly soluble in ethanol; insoluble in water.

Melting range 162-166°C (Appendix VI C).

Identification (1) To a small quantity add pyridine dropwise until it almost dissolves, and then add 5 drops of cupric sulfate TS, shake; a bluish violet colour is produced. (2) The light absorption of a solution of 10 μg per ml in ethanol exhibits a maximum at 228 nm (Appendix IV A). (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of gliclazide (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-chloroform-methanol (6 : 4 : 2) as the mobile phase. Apply separately to the plate 10 μl each of two solutions in chloroform containing (1) 20 mg per ml and (2) 0.2 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with a solution of ninhydrin and stannous chloride in ethanol (to 0.4 g of ninhydrin and 40 mg of stannous chloride add 20 ml of ethanol, shake to dissolve, prepare the solution freshly before use), after drying, spray with the same solution again, heat at 120°C for 30 minutes. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 50 ml of glacial acetic acid. Carry out method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.34 mg of $\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3\text{S}$.

Category Hypoglycaemic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Gliclazide Tablets (II)

Gliclazide Tablets (II)

Gliclazide Tablets (II) contain not less than 93.0% and not more than 107.0% of the labelled amount of gliclazide ($\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3\text{S}$).

Description White tablets.

Identification (1) Shake and extract a quantity of powdered tablets equivalent to about 0.4 g of gliclazide with two 10 ml portions of chloroform, filter and evaporate to dryness on a water bath. The residue, after drying at 105°C, complies with test (1) for Identification described under Gliclazide. (2) Dissolve a quantity of the residue obtained above in ethanol to produce a solution containing 10 μg per ml. The light absorption of the resulting solution exhibits a maximum at 228 nm (Appendix IV A).

Dissolution Carry out the method for dissolution test (Appendix X C, method 1), using 1000 ml of phosphate buffer (pH 8.6) (Dissolve 42.0 g of sodium hydroxide in 5000 ml of carbon dioxide-free water and shake thoroughly as solution A. Dissolve 136.0 g of potassium dihydrogen phosphate in 5000 ml of carbon dioxide-free water and shake thoroughly as solution B. To the mixture of 2300 ml of solution A and 2500 ml of solution B add 3150 ml of ethanol (3000 ml of dehydrated ethanol), mix well, dilute with carbon dioxide-free water to 10000 ml and mix well. The pH of the resulting solution is 8.60 ± 0.05) as the dissolution medium and adjust the rotation speed of the basket to 150 rpm. Withdraw a sample of 8 ml of the solution at exactly 60 and 180 minutes respectively, filter, use the successive filtrate as the test solution, and supply with 8 ml of

phosphate buffer (pH 8.6) accordingly in the vessel immediately. Weigh accurately 20 mg of gliclazide CRS into a 250 ml volumetric flask, add a quantity of dissolution medium, shake to dissolve it in a warm water bath. Cool, dilute with dissolution medium to volume and mix well as the reference solution. Transfer 5 ml each of the above solutions, accurately measured, to two 25 ml volumetric flasks respectively, dilute with dissolution medium to volume and mix well. Measure the absorbances of the resulting solutions at 226 nm. Calculate the content of $C_{15}H_{21}N_3O_4S$ dissolved from each tablet at 60 and 180 minutes separately. Not more than 50% and not less than 75% of the labelled amount is dissolved in 60 and 180 minutes respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powdered tablets equivalent to about 80 mg of gliclazide add 50 ml of chloroform, shake for 30 minutes to dissolve gliclazide. Filter through a sintered-glass filter (No. 4), wash the filter with 25 ml of chloroform in portions, combine the filtrate and washings, and evaporate to dryness in vacuum at a temperature below 40°C. Dissolve the residue in 40 ml of glacial acetic acid, carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.34 mg of $C_{15}H_{21}N_3O_4S$.

Category Hypoglycaemic.

Strength 80 mg

Storage Preserve in tightly closed containers, protected from light.

Glipizide

$C_{21}H_{27}N_5O_4S$ 445.54

Glipizide is 1-cyclohexyl-3-[[p-[2-(5-methylpyrazine-2-carboxamido) ethyl] phenyl]-sulfonyl] urea. It contains not less than 98.5% of $C_{21}H_{27}N_5O_4S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; almost flavourless. Slightly soluble in acetone, chloroform and dioxane; very slightly soluble in ethanol; insoluble or practically insoluble in water; freely soluble in dilute sodium hydroxide solution.

Melting range 203-208°C (Appendix VI C).

Identification (1) To 50 mg add 5 ml of dioxane, heat on water bath to dissolve it, add 1 ml of 0.5% 2,4-dinitrofluorobenzene solution in dioxane, boil it for 2 to 3 minutes, a brilliant yellow colour is produced.

(2) The light absorption of a solution of about 25 µg per ml in phosphate BS (pH 7.4) exhibits two maxima at 222 nm and 275 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glipizide (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L sodium dihydrogen phosphate solution (adjust pH to 6.00 ± 0.05 by 2.0 mol/L sodium hydroxide solution)-methanol (55 : 45) as the mobile phase. Detection wavelength is 225 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of glipizide and the resolution factor between the peaks of glipizide and 4-[2-(5-methylpyrazine-2-carboxamido) ethyl] should comply with the requirement. Dissolve about 25 mg of the substance being examined, weighed accurately, in 25 ml of methanol to a 50 ml volumetric flask, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume as solution (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (2). Dissolve about 12.5 mg of 4-[2-(5-methylpyrazine-2-carboxamido) ethyl] CRS, weighed accurately, in methanol to a 50 ml volumetric flask and dilute with methanol to volume, mix well as solution (3). Measure accurately 1 ml of solution (3) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (4). Inject 20 µl of solution (2) into the column, adjust the attenuation so that the peak height in the chromatogram is 10%-25% of full scale of the chart. Inject separately accurately 20 µl each of the solution (1), (2) and (4) into the column and record the chromatogram for twice the retention time of the principal peak. If there is any peak in the chromatogram obtained with solution (1) corresponding to the principal peak in the chromatogram obtained with solution (4), its area is not greater than the area of the principal peak in the chromatogram obtained with solution (4), the area of any peak other than the principal peak and the peak mentioned above is not greater than 1/2 of the area of principal peak in the chromatogram obtained with solution (2), the sum of the areas of such peaks is not greater than the area of the principal peak obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.4 g, accurately weighed, in 50 ml of dimethylformamide, add 2 drops of quinaldine red IS, titrate with sodium methoxide (0.1 mol/L) VS until the colour changes from red to colourless. Perform a blank determination and make any necessary correction. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 44.55 mg of $C_{21}H_{27}N_5O_4S$.

Category Antidiabetic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Glipizide Capsules (2) Glipizide Tablets

Glipizide Capsules

Glipizide Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of glipizide ($C_{21}H_{27}N_5O_4S$).

Description Capsules containing white or almost white powder.

Identification (1) The retention time of principle peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of glipizide CRS.

(2) Dissolve a quantity of the contents of the capsules in methanol to produce a solution of about 10 µg per ml and filter. The light absorption of the filtrate exhibits two maxima at 226 nm and 274 nm (Appendix IV A).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer the content of 1 capsule to a 100 ml volumetric flask (for strength 5 mg) or 50 ml volumetric flask (for strength 2.5 mg), wash the shell with 50 ml (for strength 5 mg) or 25 ml (for strength 2.5 mg) of methanol, transfer the washings to the volumetric flask, treated by ultrasonic for 15 minutes to dissolve glipizide, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, mix well and filter, use the successive filtrate as test solution. Carry out the method as described under the Assay. Calculate the content of $C_{21}H_{27}N_5O_4S$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml (for strength 5 mg) or 125 ml (for strength 2.5 mg) of phosphate BS (pH 7.8-8.0) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exact 45 minutes and filter. Measure the absorbance of the successive filtrate at 274 nm (Appendix IV A). Weigh accurately about 20 mg of glipizide CRS, dissolve in methanol in a 50 ml volumetric flask, add methanol to volume, mix well. Transfer 5 ml of the resulting solution to a 100 ml volumetric flask, dilute to volume with phosphate BS (pH 7.8-8.0) and mix well, measure the absorbance in the same manner. Calculate the dissolution of $C_{21}H_{27}N_5O_4S$ from each capsule. Not less than 70% of the labelled amount is dissolved.

Related substances Dissolve a quantity of the contents of the capsules equivalent to about 25 mg of glipizide in a 50 ml volumetric flask, add 25 ml methanol to dissolve glipizide, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, mix well, filter, use the successive filtrate as the test solution. Accurately measure 1 ml of the test solution, into a 100 ml volumetric flask, add mobile phase to volume and mix well, take the solution as the reference solution (a). Dissolve about 12.5 mg of impurity A 4-[2-(5-methylpyrazine-2-formamido) ethyl] benzene sulphonamide CRS, accurately weighed, in methanol in a 50 ml volumetric flask, dilute with methanol to volume, mix well. Dilute 1.0 ml to 100.0 ml with mobile phase and mix well as the reference solution (b). Carry out the method as described under Assay. Inject 20 µl of the reference solution (a) into the column. Adjust the attenuation so that the principle peak height in the chromatogram is 10%-25% of full scale of the chart. Inject separately 20 µl each of the test solution, the reference solution (a) and (b) into the column, and record the chromatogram for twice the retention time of the principle peak. The area of impurity A peak in the chromatogram obtained with the test solution is not greater than twice of area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0%), the sum of areas of the secondary peaks other than the impurity A, and the principal peak is not greater than twice area of the principal peak in the chromatogram obtained with the reference solution (a).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L sodium dihydrogen phosphate solution (adjust to pH 6.00 ± 0.05 with 2.0 mol/L sodium hydroxide solution)-methanol (55 : 45) as the mobile phase. Detection

wavelength is 225 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of glipizide.

Procedure Weigh accurately 20 capsules, mix well the contents of the capsules, transfer a quantity, equivalent to about 5 mg of glipizide accurately weighed, in a 100 ml volumetric flask, add 50 ml of methanol, treated by ultrasonic for 15 minutes to dissolve glipizide, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, shake well and filter, inject 20 µl of the successive filtrate into the column, record the chromatogram. Transfer about 25 mg of glipizide CRS, accurately weighed, to a 50 ml volumetric flask, add a quantity of methanol, shake thoroughly to dissolve glipizide and dilute to volume with methanol, mix well. Transfer 5 ml, accurately measured, to another 50 ml volumetric flask, add 20 ml methanol and dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, mix well. Repeat the operation as described above. Calculate the content of $C_{21}H_{27}N_5O_4S$ with respect to the peak area obtained in the chromatogram by external standard method.

Category As described under Glipizide.

Strength (1) 2.5 mg (2) 5 mg

Storage Preserve in tightly closed containers, protected from light.

Glipizide Tablets

Glipizide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of glipizide $C_{21}H_{27}N_5O_4S$.

Description White tablets or coated tablets.

Identification (1) To powder equivalent to 50 mg of glipizide add 10 ml of dioxane, heat on water bath to dissolve glipizide, add 1 ml of 0.5% 2,4-dinitro-fluorobenzene solution in dioxane, boil it for 2 to 3 minutes, a brilliant yellow colour is produced.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the powdered tablets containing 25 mg of glipizide, weighed accurately, in 25 ml of methanol to a 50 ml volumetric flask, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume and filter, take the successive filtrate as solution (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (2). Dissolve about 12.5 mg of impurity A 4-[2-(5-methylpyrazine-2-carboxamido) ethyl] CRS, weighed accurately, in methanol in a 50 ml volumetric flask and dilute with methanol to volume, mix well as solution (3). Measure accurately 1 ml of solution (3) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (4). Inject 20 µl of solution (2) into the column, adjust the attenuation so that the peak height in the chromatogram is 10%-25% of full scale of the chart. Inject separately accurately 20 µl each of the solution (1), (2) and (4) into the column and record the chromatogram for twice the retention time of the principal peak. In the chromatogram obtained with solution (1), the area of the peak chromatogram to impurity A is not greater than twice area of the corresponding peak in the chromatogram obtained with solution (4) (1.0%). The sum of the areas of any peak

other than the principal peak and the peak corresponding to impurity A is not greater than twice the area the principal peak of solution (2).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Take 1 tablet with phosphate BS (pH 7.4) in a mortar and transfer with phosphate BS (pH 7.4) in portions to a 50 ml (for strength 2.5 mg) or 100 ml (for strength 5 mg) volumetric flask. Carry out the method as described under Assay, beginning at the words "mix well, filter and take the successive filtrate as the test solution (1)" and calculate the content of $C_{21}H_{27}N_3O_4S$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml of phosphate BS (pH 7.4) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes, filter and take successive filtrate as the test solution. Measure 12 mg of glipizide CRS in a 50 ml of volumetric flask, add a quantity of phosphate BS (pH 7.4), heat on water bath to dissolve glipizide and cool; dilute to volume with phosphate BS (pH 7.4) and mix well. Transfer 5 ml to a 200 ml volumetric flask, dilute to volume with phosphate BS (pH 7.4) and mix well as reference solution. Measure the absorbances of the resulting solutions at 222 nm (Appendix IV A). Calculate the dissolution of $C_{21}H_{27}N_3O_4S$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L sodium dihydrogen phosphate solution (adjust pH to 6.00 ± 0.05 by 2.0 mol/L sodium hydroxide solution)-methanol (55 : 45) as the mobile phase. Detection Wavelength is 225 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of glipizide.

Procedure Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 5 mg of glipizide in a 100 ml volumetric flask, add 50 ml of methanol, for 15 minutes of ultrasonic processing until glipizide is dissolved. Dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, mix well. Filter and take the successive filtrate as solution (1). Inject 20 μ l of solution (1) into the column and record the chromatogram. Dissolve a quantity of glipizide CRS, accurately weighed, in a quantity of methanol in a 50 ml volumetric flask with shaking and dilute to volume with methanol, mix well as solution (2). Measure accurately 5 ml of solution (2) to a 50 ml volumetric flask and add 20 ml of methanol, dilute with 0.1 mol/L sodium dihydrogen phosphate solution to volume, mix well and repeat the operation as described above, calculate the content of $C_{20}H_{24}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Glipizide.

Strength (1) 2.5 mg (2) 5mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Gliquidone

$C_{27}H_{33}N_3O_6S$ 527.64

33342-05-1

Gliquidone is 1-cyclohexyl-3-*p*-[2-(3,4-dihydro-7-methoxy-4,4-dimethyl-1,3-dioxo-2-(1*H*)-isoquinolyl) ethyl] phenylsulphonylurea. It contains not less than 98.0% and not more than 102.0% of $C_{27}H_{33}N_3O_6S$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; tasteless.

Freely soluble in chloroform; sparingly soluble in acetone; slightly soluble in ethanol or methanol; practically insoluble in water.

Melting point 178-182°C (Appendix VI C).

Identification (1) To about 10 mg add 5 drops of phenylhydrazine, heat until the solution becomes clear, allow to cool and add 0.5 ml of ammonia TS, 0.5 ml of 10% nickel sulfate solution and 1 ml of chloroform, shake thoroughly, allow to stand: a violet-red colour is produced in the lower layer solution.

(2) The retention time of principal peak of gliquidone in the substance being examined in the chromatogram obtained in the Assay is identical with that of gliquidone CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of gliquidone (Appendix XVI).

Chloride To 2.0 g add 100 ml of water, heat to boil, cool quickly and filter, to the filtrate add a quantity of water to produce 100 ml, mix well. Carry out the limit test for chloride (Appendix VIII A), using 25 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.014%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 25 ml of the filtrate obtained under the limit test for chloride. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.04%).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase with the aid of ultrasonication, to produce solutions of 2 mg per ml (solution 1) and 20 μ g per ml (solution 2). Dissolve a quantity of isoquinoline impurity CRS, accurately weighed, in mobile phase to produce a solution of 10 μ g per ml (solution 3). Carry out the method for high performance liquid chromatography as described under Assay, inject 20 μ l of solution (2) into the column, adjust the attenuation so that the principal peak height in chromatogram is 10%-20% of the full scale of the chart. And then inject separately 20 μ l each of solutions (1), (2) and (3) into the column, and record the chromatogram for twice the retention time of the principal peak. Calculate the content of isoquinoline impurity with respect to the peak area obtained in the chromatogram by the external standard method. The isoquinoline impurity is not more than 0.75%. The sum of the areas of all peaks

other than the principal peak and the peak of isoquinoline impurity in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium dihydrogen phosphate solution (dissolve 1.725 g of ammonium dihydrogen phosphate in 300 ml of water, adjust pH to 3.5 ± 0.1 with phosphoric acid)-acetonitrile (3 : 5) as the mobile phase. Detection wavelength is 310 nm. Dissolve a quantity of gliquidone CRS and isoquinoline impurity CRS in mobile phase with the aid of ultrasonication, to produce a solution of each of 50 µg per ml, inject 20 µl into the column, record the chromatogram. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of gliquidone, the resolution factor between the peaks of gliquidone and isoquinoline impurity complies with the related requirements.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase with the aid of ultrasonication to produce a solution of 0.1 mg per ml, inject 20 µl into the column and record the chromatogram. Repeat the operation, using gliquidone CRS instead of the substance being examined, calculate the content of $C_{27}H_{33}N_3O_6S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Hypoglycaemic.

Storage Preserve in tightly closed containers.

Preparation Gliquidone Tablets

Gliquidone Tablets

Gliquidone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of gliquidone ($C_{27}H_{33}N_3O_6S$).

Description White tablets.

Identification (1) The light absorption of a solution obtained in Assay exhibits a maximum at 310 nm and a minimum at 280 nm (Appendix IV A). Dilute the solution 10 times with methanol, the light absorption exhibits a maximum at 222 nm.

(2) Dissolve a quantity of the powdered tablets in a quantity of mobile phase with the aid of ultrasonication, to produce a solution of 0.1 mg per ml, filter and use the filtrate as the test solution. Dissolve a quantity of gliquidone CRS in a quantity of mobile phase with the aid of ultrasonication, to produce a solution of 0.1 mg per ml as the reference solution. Carry out the method for high performance liquid chromatography as described under Related substances, inject separately 20 µl of each of the solutions mentioned above into the column, and record the chromatogram. The retention time of principal peak of gliquidone in the substance being examined in the chromatogram obtained is identical with that of gliquidone CRS.

Dissolution Carry out the dissolution test (Appendix XC, method 2), using 500 ml of phosphate BS (dissolve 10 g of disodium hydrogen phosphate in 1000 ml of water, adjust the pH value to 8.5 with phosphoric acid) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 45 minutes and filter. Use the successive filtrate as the test solution. Dissolve about 30 mg, accurately weighed, of gliquidone CRS in 10 ml of dimethylformamide in a 100 ml volumetric flask, and dilute to volume with the dissolution medium, mix well. Measure accurately 10 ml into a 50 ml volumetric flask, dilute to volume with the dissolution medium, mix well as the reference solution. Measure the absorbances of the two resulting solutions at 314 nm (Appendix IV A), calculate the dissolution of $C_{27}H_{33}N_3O_6S$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Related substances Dissolve a quantity of the powdered tablets in a quantity of mobile phase with the aid of ultrasonication, to produce a solution of 2 mg per ml, filter and use the filtrate as solution (1). Measure accurately 1 ml into a 100 ml volumetric flask, dilute to volume with mobile phase, mix well as solution (2). Dissolve a quantity of isoquinoline impurity CRS, accurately weighed, in mobile phase to produce a solution of 10 µg per ml (solution 3). Carry out the procedure described under Related substances in Gliquidone. Calculate the content of isoquinoline impurity with respect to the peak area obtained in the chromatogram by the external standard method. The isoquinoline impurity is not more than 1.0%. The sum of the areas of all peaks other than the principal peak and the peak of isoquinoline impurity in the chromatogram obtained with solution (1) is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets, equivalent to about 50 mg of gliquidone, into a 100 ml volumetric flask, add about 70 ml of methanol, treat with the aid of ultrasonication in a water bath for 15 minutes to dissolve gliquidone, allow to cool and dilute to volume with methanol, mix well and filter. Measure accurately 10 ml of the successive filtrate, into a 50 ml volumetric flask, dilute to volume with methanol, mix well. Dissolve a quantity, accurately weighed, of gliquidone CRS, in methanol to produce a solution of 0.1 mg per ml. Measure the absorbances of the resulting solutions at 310 nm (Appendix IV A), calculate the content of $C_{27}H_{33}N_3O_6S$.

Category As described under Gliquidone.

Strength 30 mg

Storage Preserve in tightly closed containers, and protected from light.

Glucose

$C_6H_{12}O_6 \cdot H_2O$ 198.17

[77029-61-9]

Glucose is D-(+)-glucopyranose monohydrate.

Description Colourless crystals or a white crystalline or granular powder; odourless; taste, sweet. Freely soluble in water; slightly soluble in ethanol.

Specific optical rotation Dissolve about 10 g, weighed accurately, in a quantity of water and 0.2 ml of ammonia TS in a 100 ml volumetric flask and dilute with water to volume. Mix well and allow to stand for 10 minutes. The specific optical rotation of the resulting solution is $+52.5^{\circ}$ – $+53.0^{\circ}$ at 25°C (Appendix VI E).

Identification (1) Dissolve about 0.2 g in 5 ml of water, add dropwise hot alkaline cupric tartrate TS; a red precipitate of cuprous oxide is produced. (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glucose (Appendix XVI).

Acidity Dissolve 2.0 g in 20 ml of water, add 3 drops of phenolphthalein IS and 0.20 ml of sodium hydroxide (0.02 mol/L) VS; a pink colour is produced.

Clarity and colour of solution Dissolve 5.0 g in hot water, cool, dilute to 10 ml with water; the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B). Any colour produced is not more intense than that of a solution prepared by diluting 1.0 ml of a reference solution (mix 3 ml of standard cobaltous chloride CS and 3 ml of standard potassium dichromate CS with 6 ml of standard copper sulfate CS and add sufficient water to produce 50 ml) with water to 10 ml.

Clarity of ethanolic solution To 1.0 g add 30 ml of 90% ethanol and reflux on a water bath for about 10 minutes; the solution is clear.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.60 g. Any opalescence produced is not more pronounced than that of a reference using 6.0 ml of sodium chloride standard solution (0.01%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.01%).

Sulfites and soluble starch Dissolve 1.0 g in 10 ml of water, add 1 drop of iodine TS; a yellow colour is produced.

Loss on drying When dried to constant weight at 105°C , loses not more than 9.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Protein Dissolve 1.0 g in 10 ml of water, add 3 ml of sulfosalicylic acid solution, no precipitate is produced.

Iron Dissolve 2.0 g in 20 ml of water, add 3 drops of nitric acid, boil gently for 5 minutes. Allow to cool, dilute to 45 ml with water, add 3 ml of ammonium thiocyanate solution (30→100) and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner of iron standard solution (0.001%).

Heavy metals Dissolve 4.0 g in 23 ml of water, add 2 ml of sodium acetate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Arsenic Dissolve 2.0 g in 5 ml of water, add 5 ml of dilute sulfuric acid and 0.5 ml of potassium bromide-bromine TS. Heat on a water bath for about 20 minutes and maintain the presence of excess of bromine. Add a quantity of potassium bromide-bromine TS, if necessary. Replace the evaporated water constantly and cool, then add 5 ml of hydrochloric acid and dilute with water to 28 ml. The solution complies with

the limit test for arsenic (Appendix VIII J, method 1) (0.0001%).

Microbial Limit Carry out the microbial limit test (Appendix XI J), besides that number of bacterial is not more than 1000 and that of yeasts is not more than 100 per g, escherichia coli is absence.

Category Nutrient.

Storage preserve in tightly closed containers.

Preparation (1) Glucose Injection
(2) Glucose and Sodium Chloride Injection

Glucose Injection

Glucose Injection is a sterile solution of glucose in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of glucose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$).

Description A clear, colourless or almost colourless liquid; taste, sweet.

Identification Add a few drops of the injection to hot alkaline cupric tartrate TS; a red precipitate of cuprous oxide is produced.

pH value 3.2–5.5 (Appendix VI H).

5-Hydroxymethylfurfural Transfer an accurately measured volume equivalent to 1.0 g of glucose to a 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance at 284 nm (Appendix IV A); the absorbance is not greater than 0.32.

Heavy metals Measure a volume equivalent to 3 g of glucose, evaporate to about 20 ml and cool if necessary. Add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%, calculated with reference to the content of glucose.

Bacterial Endotoxin Comply with the test for Bacterial Endotoxin (Appendix XI E), less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a volume equivalent to 10 g of glucose to a 100 ml volumetric flask, add 0.2 ml of ammonia TS dilute with water to volume and mix well (injections of 10% strength or less may be used directly with the addition of ammonia TS), allow to stand for 10 minutes. Carry out the determination of optical rotation (Appendix VI E). The observed rotation in degree multiplied by 2.0852, represents the weight in g of $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$, in the volume taken for Assay.

Category As described under Glucose.

Strength

(1) 10 ml : 2 g	(2) 20 ml : 5 g

Glucose and Sodium Chloride Injection

Glucose and Sodium Chloride Injection is a sterile

solution of glucose and sodium chloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of glucose ($C_6H_{12}O_6 \cdot H_2O$) and sodium chloride (NaCl).

Description A clear, colourless liquid.

Identification (1) Complies with test for Identification described under Glucose Injection.

(2) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 3.5-5.5 (Appendix VI H).

5-Hydroxymethylfurfural Dilute 2 ml, accurately measured with water to 50 ml, mix well. Measure the absorbance of the resulting solution at 284 nm (Appendix IV A); the absorbance is not greater than 0.25.

Heavy metals Evaporate 40 ml to about 20 ml, cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Bacterial Endotoxin Comply with the test for Bacterial Endotoxin (Appendix XI E), less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Glucose Carry out the determination of optical rotation (Appendix VI E). The observed rotation in degree multiplied by 2.0852 represents the weight in g of $C_6H_{12}O_6 \cdot H_2O$ of the testing volume.

Sodium chloride Measure accurately 20 ml, add 30 ml of water, 5 ml of dextrin solution (1→50), 2 ml of 2.5% borax solution and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Category Body fluid supplement.

Strength

- (1) 100 ml : Glucose 5 g and Sodium Chloride 0.9 g
- (2) 100 ml : Glucose 10 g and Sodium Chloride 0.9 g
- (3) 250 ml : Glucose 12.5 g and Sodium Chloride 2.25 g
- (4) 250 ml : Glucose 25 g and Sodium Chloride 2.25 g

Glutamic Acid

$C_5H_9NO_4$ 147.13

[56-86-0]

Glutamic Acid is L-2-amino-pentane-1,5-dioic acid. It contains not less than 98.5% of $C_5H_9NO_4$, calculated on the dried basis.

Description White crystals or a crystalline powder; taste, slightly sour. Soluble in hot water; slightly soluble in

water; insoluble in ethanol, acetone or ether.

Specific optical rotation +31.5° to +32.5°, in a solution of 70 mg per ml 2 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glutamic acid (Appendix XVI).

Transmittance of solution Dissolve 1.0 g in 20 ml of 2 mol/L hydrochloric acid solution, measure the transmittance at 430 nm (Appendix IV A), not less than 98.0%.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfate Shake to dissolve 0.50 g with 2 ml of dilute hydrochloric acid TS and 5 ml of water. Carry out the limit test for sulfates (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference solution using 1 ml of potassium sulfate standard solution (0.02%).

Ammonium salt Carry out the limit test for ammonium salt (Appendix VIII K), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acid Dissolve a quantity in 0.5 mol/L hydrochloric acid solution to produce a solution of 20 mg per ml as test solution. Dilute an accurately measured quantity with 0.5 mol/L hydrochloric acid solution to produce a solution of 0.1 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-water-glacial acetic acid (2 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions. After developing and removal of the plate, dry in air, spray with ninhydrin solution in acetone (1→50) and heat at 80°C until the colour is produced. Examine the spots immediately. Any spot other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron To 2.0 g add 6 ml of dilute hydrochloric acid TS and a quantity of water, heat to dissolve, cool, dilute to 25 ml with water. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.0005%).

Heavy Metals Carry out the limit test for heavy metals (Appendix VIII H) using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Dissolve 2.0 g in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens To a quantity add Sodium Chloride Injection to produce a solution of 20 mg per ml. Heat to dissolve and cool to 37°C. Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of rabbit's weight (For Parenteral Administration).

Assay Dissolve 0.25 g, weigh accurately, in 50 ml of boiling water. Cool, add 5 drops of bromothymol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS until the colour changes from yellow to bluish green. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 14.71

mg of $C_5H_9NO_4$.

Category Amino acids.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Glutamic Acid Tablets
(2) Sodium Glutamate Injection
(3) Potassium Glutamate Injection

Glutamic Acid Tablets

Glutamic Acid Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of glutamic acid ($C_5H_9NO_4$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 5 mg of glutamic acid add 5 ml of water, heat to dissolve the glutamic acid and filter. Add to the filtrate about 5 mg of ninhydrin, heat, the solution exhibits a blue to violet-blue colour.

(2) Dissolve a quantity of the powdered tablets with sodium hydroxide TS and filter, neutralize the filtrate with hydrochloric acid, filter, wash the crystals with water and dry. Dissolve the crystals and glutamic acid CRS separately in hot water to produce solutions of 2.5 mg per ml. Carry out the method for ascending paper chromatography (Appendix V A), using *n*-butanol-acetic acid-ethanol-water (4 : 1 : 1 : 2) as the mobile phase. Apply separately to the paper 5 μ l each of the two solutions. After developing and removal of the paper, dry in air, spray with ninhydrin solution (dissolve 20 mg of ninhydrin in 10 ml of acetone, add 0.4 ml of glacial acetic acid) and dry in hot air. The colour and position of the principle spot in the chromatogram obtained with the substance being examined correspond to that of the principle spot obtained with the reference substance.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 2), using 1000 ml of phosphate BS (pH 7.2) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute the successive filtrate with phosphate BS (pH 7.2) to produce a solution of 0.3 mg per ml, as the test solution. Dissolve a quantity of glutamic acid CRS, accurately weighed, in phosphate BS (pH 7.2) to produce a reference solution of 0.3 mg per ml. Transfer 1 ml each of the two solutions to 50 ml volumetric flask, add 1 ml each of 0.5% ninhydrin solution and phosphate BS (pH 7.2), mix well, warm for 20 minutes in a water bath, cool in air, dilute with phosphate BS (pH 7.2) to volume and mix well. Measure the absorbances of the resulting solutions at 567 nm (Appendix IV A), calculate the dissolution of glutamic acid from each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A) except that the tablets disintegrate within 30 minutes.

Assay Weigh accurately and pulverize 10 tablets, dissolve an accurately weighed quantity of the powder equivalent to about 0.4 g of glutamic acid in 50 ml of boiling water. cool, add 0.5 ml of bromothymol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS until the colour changes from yellow to bluish green. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 14.71 mg of $C_5H_9NO_4$.

Category As described under Glutamic Acid.

Strength (1) 0.3 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Strong Glutaryl Solution

Strong Glutaryl Solution is a solution of glutaryl in water. It contains not less than 95.0% and not more than 105.0% of the labelled amount of glutaryl ($C_5H_8O_2$).

Description A clear, yellowish liquid; odour, characteristic and pungent.

Freely miscible with water or ethanol.

Identification (1) Heat 1 ml in a test tube with 1 ml of ammoniated silver nitrate TS on a water bath for several minutes, a fine grey precipitate is produced or a silver mirror is produced on the tube wall.

(2) To 5 drops add a 1% solution of salicylic acid in sulfuric acid, a brownish-red colour is produced.

Clarity To 5.0 ml add water to a volume of 50 ml and shake well, the solution is clear; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

pH value 2.5-3.5 (Appendix VI H).

Free acid To 5 ml, accurately measured, add 5 ml of water and 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS until a pink colour is produced and persists for 15 seconds. The sodium hydroxide (0.1 mol/L) VS consumed is not more than 3.8 ml.

Assay To a quantity equivalent to about 0.2 g of glutaryl, accurately weighed, add 20 ml of 6.5% triethanolamine solution and 25 ml of a neutral solution of hydroxylamine hydrochloride (dissolve 17.5 g of hydroxylamine hydrochloride in 75 ml of water, dilute with isopropanol to 500 ml, shake well, add 15 ml of ethanolic solution of 0.04% bromophenol blue and titrate with 6.5% solution of triethanolamine until a bluish green colour is produced), shake well and allow to stand for 1 hour. Titrate with sulfuric acid (0.25 mol/L) VS until a bluish green colour is produced. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.25 mol/L) VS is equivalent to 25.03 mg of $C_5H_8O_2$.

Category Antiseptic and disinfectant.

Strength (1) 20% (g/g) (2) 25% (g/g)

Storage Preserve in tightly closed containers, protected from light, stored in a dark and cool place.

Preparation Dilute Glutaryl Solution

Dilute Glutaryl Solution

Dilute Glutaryl Solution is a dilution of Strong Glutaryl Solution in suitable amount of stabilizer. It contains 1.80%-2.20% (g/ml) of glutaryl ($C_5H_8O_2$).

Description A clear, colourless or slightly yellow liquid; odour, characteristic.

Identification Complies with the tests for Identification described under Strong Glutaryl Solution.

pH value 3.0-4.0 (Appendix VI H).

Assay Carry out the Assay described under Strong Glutaral Solution, using 10 ml, accurately measured. Each ml of sulfuric acid (0.25 mol/L) VS is equivalent to 25.03 mg of $C_5H_8O_2$.

Category, Storage As described under Strong Glutaral Solution.

Glycerol

$C_3H_8O_3$ 92.09

[56-81-5]

Glycerol is 1,2,3-propanetriol. It contains not less than 95.0% of $C_3H_8O_3$.

Description A clear, colourless, syrupy liquid; taste, sweet, followed by a warm feeling; hygroscopic; the aqueous solution (1→10) exhibits a neutral reaction. Miscible with water or ethanol; slightly soluble in acetone; insoluble in chloroform or ether.

Relative density Not less than 1.2569 at 25°C (Appendix VI A).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glycerol (Appendix XVI).

Colour Place 50 ml in a Nessler cylinder, its colour is not more intense than that of a reference solution (dilute 0.2 ml of standard potassium dichromate CS with water to 50 ml).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 5.0 g. Any opalescence produced is not more pronounced than that of a reference using 7.5 ml of sodium chloride standard solution (0.0015%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 10 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.002%).

Fatty acids and esters Mix 40 g with 40 ml of freshly boiled and cooled water, add accurately 10 ml of sodium hydroxide (0.1 mol/L) VS and boil the mixture for 5 minutes. Cool, add a few drops of phenolphthalein IS, and titrate the excess sodium hydroxide with hydrochloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction; not more than 4.0 ml of sodium hydroxide (0.1 mol/L) VS is consumed.

Acrolein, glucose and ammonium compounds Mix 5 ml with 5 ml of 10% potassium hydroxide solution; no yellow colour is produced when kept for 5 minutes at 60°C, no odour of ammonia is perceptible.

Readily carbonizable substances Carry out the limit test for readily carbonizable substance (Appendix VIII O), using 5.0 ml, allow to stand for 1 hour; any colour produced is not more intense than that of a reference solution (mix 0.2 ml of standard cobaltous chloride CS, 1.6 ml of standard potassium dichromate CS and 8.2 ml of water).

Residue on ignition Heat 20.0 g to kindling, allow to burn without further heating, cool. Carry out the test for residue on ignition; not more than 2 mg (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 10.0 g. Any colour produced is not more intense than that of a reference, using 2.0 ml of standard iron solution (0.0002%).

Heavy metals Dissolve 5.0 g in 2 ml of acetate BS (pH 3.5), add a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0002%.

Assay Dissolve about 0.1 g, accurately weighed, in 45 ml of water, add 25 ml of 2.14% sodium periodate solution, mix well, allow to stand in dark for 15 minutes. Add 5 ml of 50% glycol solution, mix well and allow to stand in dark for 20 minutes. Add 0.5 ml of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 9.21 mg of $C_3H_8O_3$.

Category Lubricating laxative.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Glycerol Suppositories

Glycerol and Fructose Injection

Glycerol and Fructose Injection is a sterile mixture of Glycerol, Fructose and Sodium Chloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of glycerol ($C_3H_8O_3$); not less than 93.0% and not more than 107.0% of the labelled amount of fructose ($C_6H_{12}O_6$) and sodium chloride (NaCl), respectively.

Formula	Glycerol	100 g
	Fructose	50 g
	Sodium chloride	9 g
	Water for injection	a sufficient quantity
	To make	1000 ml

Description A clear, colourless liquid.

Identification (1) Measure 10 ml, add 0.1 g of resorcinol and 1 ml of hydrochloric acid, heat in a water bath for 3 minutes, a red colour is produced.

(2) The retention time of three principal peaks in the substance being examined in the chromatogram obtained in the Assay are identical with that of sodium chloride CRS, fructose CRS and glycerol CRS correspondingly.

(3) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 3.0-6.0 (Appendix VI H).

5-Hydroxymethylfurfural Measure 5.0 ml, add to 20.0 ml in water and mix well. Measure the absorbance at 284 nm (Appendix IV A) and the absorbance is not more than 0.30.

Heavy metals Measure 10 ml, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.00025%.

Arsenic Measure 4 ml, add 5 ml of hydrochloric acid and 19 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.00005%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form and 0.04 mol/L phosphoric acid solution as the mobile phase. Detection wavelength is 200 nm and column temperature is 50°C. The substances are eluted in the following order: sodium chloride, fructose, glycerol and internal standard. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of sodium chloride. The resolution factor between the peaks complies with the related requirements.

Internal standard solution Measure accurately 15 ml of 1, 2-propylene glycol in a 100 ml volumetric flask, dilute to volume with the mobile phase and mix well.

Procedure Measure accurately 5 ml and 10 ml of internal standard solution in a 100 ml volumetric flask, dilute to volume with the mobile phase and mix well. Inject 20 µl of the resulting solution, accurately measured, into the column. Dissolve a quantity of sodium chloride CRS, fructose CRS and glycerol CRS in water, accurately weighed, dilute with the mobile phase to produce a solution of 9 mg, 50 mg, and 100 mg per ml, respectively. Measure accurately 5 ml of the resulting solution and 10 ml of internal standard solution in a 100 ml volumetric flask, dilute to volume with the mobile phase, mix well, measure in the same manner. Calculate the content of $C_3H_8O_3$, $C_6H_{12}O_6$ and NaCl, respectively.

Category Dehydrant.

Strength (1) 250 ml (2) 500 ml

Storage Preserve in well closed containers.

Glycerol for Injection

$C_3H_8O_3$ 92.09 [56-81-5]

Glycerol for Injection is 1,2,3-propanetriol. It contains not less than 98.0% of $C_3H_8O_3$.

Description A clear, colourless viscous liquid; taste, sweet; hygroscopic; the aqueous solution (1 → 10) exhibits a neutral reaction.

Miscible with water or ethanol; slightly soluble in acetone; insoluble in chloroform or ether.

Relative density Not less than 1.257 at 25°C (Appendix VI A).

Refractive index 1.470-1.475 (Appendix VI F).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glycerol (Appendix XVI).

Acidity or alkalinity Dilute 25.0 g to 50 ml with water, add 0.5 ml of phenolphthalein IS, the solution is colourless. Then add 0.2 ml of 0.1 mol/L sodium hydroxide solution, the solution is pink.

Colour Transfer 50 ml to a Nessler cylinder; any colour produced is not more intense than that of a reference solution prepared by diluting 0.2 ml of potassium dichromate CS to 50 ml with water.

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 5.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.0006%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 10 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of

potassium sulfate standard solution (0.002%).

Aldehydes and reducing substances Transfer 3.75 g to a Nessler cylinder with stopper, dilute to 15 ml with water and mix. Add 1.0 ml of decolorised pararosaniline (weigh 0.1 g of pararosaniline hydrochloride ($C_{19}H_{18}ClN_3$) into a conical flask with stopper, add 60 ml of water and 10 ml of 7.5% sodium metabisulfite solution, then add 4.5 ml of dilute hydrochloric acid with gentle stirring. Insert the stopper and shake until completely dissolved, dilute to 100 ml with water and mix, allow to stand for 12 hours before use), mix, insert the stopper, and allow to stand for 1 hour. Any colour produced is not more intense than that of a reference solution operated in the similar manner using 7.5 ml of formaldehyde solution (5.0 µg of formaldehyde (CH_2O) per ml) and 7.5 ml of water (The test is not valid unless the reference solution is red).

Fatty acids and esters To 40 g add 40 ml of freshly boiled and cooled water, add 10 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, and mix well. Boil for 5 minutes and cool. Add several drops of phenolphthalein IS, titrate with hydrochloric acid (0.1 mol/L) VS until the pink colour disappears. Perform a blank determination and make any necessary correction. Not more than 2.0 ml of sodium hydroxide (0.1 mol/L) VS is required.

Readily carbonizable substances Carry out the limit test for readily carbonizable substances (Appendix VIII O), using 5.0 ml, allow to stand for 1 hour. Any colour produced is not more intense than that of an equal volume of a reference solution prepared by mixing 0.2 ml of cobaltous chloride CS, 1.6 ml of potassium dichromate CS and 8.2 ml of water.

Sugar Mix 5.0 g with 5 ml of water, add 1 ml of dilute sulfuric acid, warm on a water bath for 5 minutes. Add 3 ml of 2 mol/L carbonate-free sodium hydroxide solution and 1 ml of cupric sulfate TS dropwise, mix well. The solution is blue and clear, continue to warm on a water bath for 5 minutes, the solution is still blue and no precipitate is produced.

Residue on ignition Heat 20.0 g. When the substance ignites, stop heating. After combustion, allow to cool; not more than 2 mg (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 20.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.00005%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 5.0 g; not more than 0.0002%.

Arsenic Mix 6.65 g with 23 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.00003%.

Assay Mix about 0.1 g, accurately weighed, with 45 ml of water, add 25 ml of 2.14% (g/ml) sodium periodate solution, accurately measured, mix well, and allow to stand in a dark place for 15 minutes. Add 5 ml of 50% (g/ml) ethylene glycol and mix well, allow to stand in a dark place for 20 minutes. Add 0.5 ml of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 9.21 mg of $C_3H_8O_3$.

Category Pharmaceutical aid.

Storage Preserve in well closed containers, stored in a dry place.

Glycerol Suppositories

Formula	Glycerol	1820 g
	Sodium stearate	180 g
	To make	1000 suppositories

Process Heat glycerol in a steam bath to 120°C, add powdered and dried sodium stearate and stir the mixture at a temperature of 85–95°C until sodium stearate is dissolved to form a clear solution. Filter, pour into the moulds. Allow to cool and remove the suppositories.

Description Colourless or almost colourless, transparent or translucent suppositories.

Other requirements Comply with the general requirements for suppositories (Appendix I D), except the disintegration test.

Category Lubricating laxative.

Storage Preserve in tightly closed containers, stored at a temperature below 30°C.

Glycine

$\text{C}_2\text{H}_5\text{NO}_2$ 75.07

[56-40-6]

Glycine is 2-aminoethanoic acid. It contains not less than 99.0% of $\text{C}_2\text{H}_5\text{NO}_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, sweet.

Soluble in water; practically insoluble in ethanol or ether.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glycine (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of water, pH 5.6–6.6 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.007%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 2.5 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.5 ml of potassium sulfate standard solution (0.006%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G),

using 1.50 g. Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.02 EU per mg of glycine (for parenteral administration).

Assay Dissolve about 70 mg, accurately weighed, in 1.5 ml of dehydrated formic acid, add 25 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 7.507 mg of $\text{C}_2\text{H}_5\text{NO}_2$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Glycine Irrigation Solution

Glycine Irrigation Solution

Glycine Irrigation Solution is a sterile solution of glycine in Water for Irrigation. It contains not less than 95.0% and not more than 105.0% of the labelled amount of glycine ($\text{C}_2\text{H}_5\text{NO}_2$).

Description A clear, colourless liquid.

Identification (1) Evaporate 35 ml to about 5 ml on a water bath, add 1 ml of dilute hydrochloric acid and 5 drops of 50% sodium nitrite solution. Effervescence occurs.

(2) Dilute a quantity with water to produce a solution containing 2.5 mg per ml as test solution. Prepare a reference solution of 2.5 mg of glycine CRS per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of propanol-concentrated ammonia solution (7 : 3) as the mobile phase. Apply separately to the plate 2 µl each of above two solutions, after developing and removal of the plate, dry in air, spray with ninhydrin TS, heat at 105°C for 10 minutes. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with reference solution.

pH value 4.5–6.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Other requirements Complies with the general requirements for irrigation solutions (Appendix I S).

Assay Transfer accurately 10 ml to a conical flask, add 10 ml of water and 10 ml of formaldehyde solution previously adjusted to pH 9.0, mix well. Add 5 drops of a mixed indicator solution prepared by dissolving 75 mg of phenolphthalein and 25 mg of thymol blue in 100 ml of ethanol-water (1 : 1). Titrate with sodium hydroxide (0.1 mol/L) VS until the colour changes to faint violet. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 7.507 mg of $\text{C}_2\text{H}_5\text{NO}_2$.

Category As described under Glycine.

Strength 2000 ml : 30 g

Storage Preserve in tightly closed containers, protected from light.

Glycopyrrolate

$C_{19}H_{28}BrNO_3$ 398.34

[596-51-0]

Glycopyrrolate is 3-hydroxy-1, 1-dimethylpyrrolidinium bromide α -cyclopentylmandelate. It contains not less than 99.0% of $C_{19}H_{28}BrNO_3$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Freely soluble in water, methanol or ethanol; practically insoluble in chloroform or ether.

Melting range 191-195°C (Appendix VI C), melts within a range of 2°C.

Identification (1) Dissolve about 50 mg in 5 ml of dilute acetic acid, add several drops of potassium iodobismuthate TS; an orange precipitate is produced.

(2) The light absorption of a solution of 0.5 mg per ml in water exhibits two maxima at 258 nm and 264 nm, and two minima at 254 nm and 261 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of glycopyrrolate (Appendix XVI).

(4) Yields the reactions characteristic of bromides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-water-dehydrated methanol (74 : 16 : 10) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions in ethanol containing (1) 50 mg per ml and (2) 0.2 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, spray with dilute potassium iodobismuthate TS and examine immediately. Not more than three spots, other than the principal spot in the chromatogram, obtained with solution (1) are observed. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 25 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.83 mg of $C_{19}H_{28}BrNO_3$.

Category Anticholinergic.

Storage Preserve in well closed containers.

Preparation Glycopyrrolate Tablets

Glycopyrrolate Tablets

Glycopyrrolate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of glycopyrrolate ($C_{19}H_{28}BrNO_3$).

Description White tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to about 10 mg of glycopyrrolate in methanol to produce a solution containing 0.5 mg of glycopyrrolate per ml and filter. The light absorption of the successive filtrate exhibits two maxima at 258 nm and 264 nm, and two minima at 255 nm and 262 nm.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of glycopyrrolate CRS.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 25 ml (for strength 0.5 mg) or 50 ml (for strength 1 mg) volumetric flask, add a quantity of water, shake to dissolve glycopyrrolate and dilute with water to volume. Mix well and filter through 0.8 μ m membrane. Measure the successive filtrate and carry out the procedure as described under the Assay. Calculate the content of $C_{19}H_{28}BrNO_3$.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 500 ml of water as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Use the successive filtrate as the test solution. Dissolve an accurately weighed quantity of glycopyrrolate RS in water to produce a solution of about 1 μ g (for strength 0.5 mg) or 2 μ g (for strength 1 mg) per ml as the reference solution. Carry out the procedure as described under Assay, inject accurately 20 μ l of each of the two solutions separately into the column. Calculate the dissolution of $C_{19}H_{28}BrNO_3$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium pentanesulfonate solution (dissolve 0.2 g of sodium pentanesulfonate and 1.0 g of anhydrous sodium sulfate in 615 ml of water, add 3.0 ml of 0.5 mol/L sulfuric acid solution)-acetonitrile-methanol (615 : 235 : 150) as the mobile phase. Detection wavelength is 222 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of glycopyrrolate. The resolution factor between the peak of glycopyrrolate and its adjacent impurity peaks complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to 2 mg of glycopyrrolate into a 100 ml volumetric flask, add a quantity of water, shake to dissolve glycopyrrolate, dilute to volume with water and mix well. Filter through 0.8 μ m membrane and use the successive filtrate as the test solution. Dissolve an accurately weighed quantity of glycopyrrolate CRS in water to produce a solution of 20 μ g per ml as the reference solution. Inject accurately 20 μ l of each of the two solutions separately into the column and record the

chromatogram. Calculate the content of $C_{19}H_{28}BrNO_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Glycopyrrolate.

Strength (1) 0.5 mg (2) 1 mg

Storage Preserve in tightly closed containers.

Granisetron Hydrochloride

$C_{18}H_{24}N_4O \cdot HCl$ 348.87

[107007-99-8]

Granisetron Hydrochloride is 1-Methyl-N-(9-methyl-endo-9-azabicyclo [3.3.1] non-3-yl)-1H-indazole-3-carboxamide monohydrochloride. It contains not less than 98.0% and not more than 102.0% of granisetron hydrochloride, calculated on the dried basis.

Description White or almost white crystalline powder; odourless, taste bitter.

Freely soluble in water; sparingly soluble in methanol, slightly soluble in ethanol; sparingly soluble in 0.1 mol/L hydrochloric acid solution.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of granisetron hydrochloride CRS.

(2) The light absorption of a solution of 10 μg per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 302 nm, and a minimum at 251 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of granisetron hydrochloride (Appendix XVI).

(4) Yields the reactions characteristic of chlorides (Appendix III).

Acidity The solution obtained in the test for Clarity of solution, pH 4.0-6.5 (Appendix VI H).

Clarity of solution Dissolve 0.10 g in 10 ml of water, the solution is clear.

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce solutions of 0.5 mg per ml as test solution and 5 μg per ml as reference solution. Inject 20 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject separately 20 μl each of the test solution and the reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with cyano silane group bonded silica gel and a mixture of 0.05 mol/L sodium acetate solution containing 0.25% of triethylamine (adjust to pH 6.0 with glacial acetic acid)-methanol (50 : 50) as the mobile phase. Detection wavelength is 302 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of granisetron hydrochloride.

Procedure Dissolve an accurately weighed quantity of the substance being examined, in mobile phase to produce a solution of 0.1 mg per ml, inject 20 μl of the resulting solution into the column. Repeat the operation, using granisetron hydrochloride CRS instead of the substance being examined, calculate the content of $C_{18}H_{24}N_4O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antiemetics for sickness caused by chemotherapy and radiotherapy.

Storage Preserve in tightly closed container, protected from light.

Preparation (1) Granisetron Hydrochloride Tablets
(2) Granisetron Hydrochloride Injection

Granisetron Hydrochloride Injection

Granisetron Hydrochloride Injection is a sterile solution of Granisetron Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of granisetron ($C_{18}H_{24}N_4O$).

Description A clear, colourless or almost colourless liquid.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of granisetron hydrochloride CRS.

(2) The light absorption of a solution of 10 μg per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 302 nm, and a minimum at 251 nm (Appendix IV A).

(3) Yields the reactions characteristic of chlorides (Appendix III).

pH value 4.5-7.0 (Appendix VI H).

Related substances Dilute the injection with mobile phase to produce a solution of about 0.5 mg per ml as the test solution. Dilute a quantity of above solution, accurately measured, with mobile phase to produce a solution of 5 μg per ml as reference solution. Carry out the method as described under Assay. Inject 20 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 20 μl each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of the principal peak. The sum of the secondary peak is not greater than the

area of the principal peak in the chromatogram obtained with the reference solution.

Bacterial endotoxins Carry out the test for bacterial endotoxins (Appendix XI E); less than 20 EU per mg of griseofulvin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity, dilute with mobile phase to produce a solution of about 80 µg per ml. Carry out the assay as described under griseofulvin hydrochloride, and multiply the result by 0.8955.

Category As described under Griseofulvin Hydrochloride.

Strength Calculated as $C_{18}H_{24}N_4O$
(1) 1 ml : 1 mg (2) 3 ml : 3 mg

Storage Preserve in well closed container, protected from light.

Granisetrone Hydrochloride Tablets

Granisetrone Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of granisetrone ($C_{18}H_{24}N_4O$).

Description White or almost white tablets.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of granisetrone hydrochloride CRS.

(2) The light absorption of a solution of 10 µg per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 302 nm, and a minimum at 251 nm (Appendix IV A).

(3) Shake a quantity of powdered tablets with water, filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Related substance Shake a quantity of finely powdered tablets with mobile phase to dissolve granisetrone hydrochloride. Dilute with the mobile phase to produce a solution of about 0.5 mg per ml, filter, taking the successive filtrate as the test solution. Dilute a quantity of above solution, accurately measured, with mobile phase to produce a solution of 5 µg per ml as reference solution. Carry out the method as described under Assay. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 20 µl each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of the principal peak. The sum of the secondary peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 100 ml volumetric flask, add 50 ml of 0.1 mol/L hydrochloric acid solution, shake to disintegrate. Dissolve granisetrone hydrochloride with constant shaking for 30 minutes, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, filter, taking the successive filtrate as test solution. Dissolve an accurately weighed quantity of granisetrone hydrochloride CRS in 0.1 mol/L hydrochloric acid solution, to produce a solution of 10 µg per ml as reference solution. Measure the absorbance of the resulting solutions at 302 nm (Appendix IV A). Calculate the content of $C_{18}H_{24}N_4O$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 8 mg of granisetrone, dissolve in mobile phase to produce a solution of 80 µg per ml, and filter. Measure accurately a quantity of the successive filtrate and carry out the assay as described under griseofulvin hydrochloride, multiply the result by 0.8955.

Category As described under Griseofulvin Hydrochloride.

Strength 1 mg (calculated as $C_{18}H_{24}N_4O$)

Storage Preserve in tightly closed container, protected from light.

Griseofulvin

$C_{17}H_{17}ClO_6$ 352.77

[126-07-8]

Griseofulvin is 7-chloro-2',4,6-trimethoxy-6'-β-methylspiro [benzofuran-2 (3H), 1'-[2] cyclohexene]-3,4'-dione. It contains not less than 95.0% of $C_{17}H_{17}ClO_6$, calculated on the dried basis.

Description A white, or almost white fine powder; odourless; taste slightly bitter.

Freely soluble in dimethylformamide; slightly soluble in dehydrated ethanol; very slightly soluble in water.

Melting range 218-224°C (Appendix VI C).

Specific optical rotation +352° to +367°, in a solution of 10 mg per ml in dimethylformamide (Appendix IV E).

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of griseofulvin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of griseofulvin (Appendix XVI).

Particle size Moisten 10 mg with 2-4 drops of water, add 20 glass beads, shake for 3-5 minutes, add 10 ml of a 5% solution of acacia, shake thoroughly for 10 minutes. Withdraw the resulting solution with a dropper immediately from the bottom, wipe the outside of the dropper with filter paper; add vertically a drop on Blood Cell Counting Chamber and examine under a microscope; particles of low to 5 µm in maximum dimension are not less than 85% and particles of 50 µm may be occasionally observed, particles of up to 50 µm are not more than 5.

Related substances Dissolve an accurately weighed quantity in the mobile phase to produce a solution of 0.5 mg per ml as the test solution; measure accurately 1 ml of the above solution in a 100 ml volumetric flask and dilute with mobile phase to volume, mix well, as the reference solution. Carry out the method described under Assay, inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Inject separately 10 µl each of the test solution and the reference solution and record the chromatogram for twice the retention time of principle peak. The relative retention time for griseofulvin is 1.0 and for dechlorogriseofulvin is about 0.7. The area of dechlorogriseofulvin is not greater than 2.5 times that of the

principal peak in the chromatogram obtained with the reference solution (2.5 per cent). The relative retention time for dehydrogriseofulvin is about 1.1. The area of dehydrogriseofulvin is not greater than 0.75 times that of the principal peak in the chromatogram obtained with the reference solution (0.75 per cent). The sum of the areas of all other impurity peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). (Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.)

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII M).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-acetonitrile-methanol (57 : 38 : 5) as the mobile phase, adjust the pH to 3.7 ± 0.2 with phosphoric acid. The wavelength of the detector is 254 nm and the number of theoretical plates of the column is not less than 800, calculated with reference to the peak of griseofulvin.

Procedure Dissolve about 50 mg of the substance being examined, accurately weighed, in dehydrated ethanol and dilute to volume in a 50 ml volumetric flask, mix well. Measure accurately 5.0 ml to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well, inject 10 µl into the column. Repeat the operation using griseofulvin CRS instead of the substance being examined, calculate the content of C₁₇H₁₇ClO₆.

Category Antifungus.

Storage Preserve in tightly closed containers.

Preparation Griseofulvin Tablets

Griseofulvin Tablets

Griseofulvin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of griseofulvin (C₁₇H₁₇ClO₆).

Description White, or almost white tablets.

Identification The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of griseofulvin CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 0.54% sodium lauryl sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 60 minutes and filter. Measure accurately a quantity of the successive filtrate and dilute with methanol-water (4 : 1) to produce a solution of about 5.6 µg per ml. Measure the absorbance at 291 nm (Appendix IV A). Calculate the dissolution of C₁₇H₁₇ClO₆ from each tablet, taking 686 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Related substances Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powder equivalent to about 50 mg of griseofulvin, in a 100 ml volumetric flask add a quantity of mobile phase, sonicate for 30 minutes, cool, dilute with mobile phase to volume, mix well, as the

test solution. Carry out the method described under Griseofulvin. The area of dechlorogriseofulvin is not greater than 2.5 times that of the principal peak in the chromatogram obtained with the reference solution (2.5%). The area of dehydrogriseofulvin is not greater than 0.75 times area of the principal peak in the chromatogram obtained with the reference solution (0.75%).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powder equivalent to about 100 mg of griseofulvin, accurately weighed, in a 100 ml volumetric flask add a quantity of dehydrated ethanol, sonicate for 30 minutes, cool, dilute with dehydrated ethanol to volume and mix well. Filter with a 0.45 µm membrane, measure accurately 5.0 ml of the successive filtrate to a 50 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the Assay described under Griseofulvin.

Category As described under Griseofulvin.

Strength (1) 0.1 g (2) 0.25 g

Storage Preserve in tightly closed containers.

Guanethidine Sulfate

(C₁₀H₂₂N₄)₂ · H₂SO₄ 494.69

[60-02-6]

Guanethidine Sulfate is 2-[hexahydro-1 (2H-azocinyl)] ethyl guanidine sulfate (2 : 1). It contains not less than 98.0% of (C₁₀H₂₂N₄)₂ · H₂SO₄, calculated on dried basis.

Description White crystals or a crystalline powder; odourless; taste, bitter.

Freely soluble in hot water; soluble in water; slightly soluble in ethanol; very slightly soluble in chloroform or ether.

Identification (1) Dissolve about 30 mg in 20 ml of water, add 2 ml of sodium hydroxide TS and 25 ml of trinitrophenol TS, a yellow precipitate is produced. Wash the precipitate with water and dry at 100°C, it melts at 156-162°C, with decomposition (Appendix VI C).

(2) Dissolve about 10 mg in 10 ml of water. Add 2 ml of an alkaline α-naphthol solution, prepared by dissolving 0.5 g of α-naphthol, 3 g of sodium hydroxide and 8 g of sodium carbonate in water to make 50 ml. Then add 1 ml of 2,3-butanedione solution (1 → 2000), mix well, and allow to stand at room temperature, a red colour develops.

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Alkalinity pH of a 0.2% solution in water is 9.0-10.0 (Appendix VI H).

Loss on drying When dried in vacuum at 60°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 16.49 mg of $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Guanethidine Sulfate Tablets

Guanethidine Sulfate Tablets

Guanethidine Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of guanethidine sulfate $[(C_{10}H_{22}N_4)_2 \cdot H_2SO_4]$.

Description White tablets.

Identification Add 50 ml of ethanol to a quantity of powdered tablets equivalent to 0.1 g of guanethidine sulfate, shake well. Filter and evaporate the filtrate to dryness. The residue complies with the tests for Identification described under Guanethidine Sulfate.

Other requirements Comply with the general requirements for Tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity, equivalent to 0.15 g of guanethidine sulfate in a Kjeldahl flask add 10 g of potassium sulfate, 0.3 g of anhydrous cupric sulfate, 0.2 g of yellow mercuric oxide and 20 ml of sulfuric acid. Heat gently until frothing subsides. Raise the temperature and boil the mixture briskly until a clear, green solution is obtained. Continue the heating for 1 hour, cool, add cautiously 300 ml of water along the inner wall of the flask, mix well and allow to cool. Add a mixture of 80 ml of sodium hydroxide solution (1→2) and 5 ml of sodium thiosulfate solution (1→2) along the inner wall of the flask to form a layer beneath the acid solution. Carry out the method for determination of nitrogen (Appendix VI D, method 1), beginning at the words "add a few pieces of Zinc granules...". Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 6.184 mg of $(C_{10}H_{22}N_4)_2 \cdot H_2SO_4$.

Category As described under Guanethidine Sulfate.

Strength (1) 10 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Halcinonide

$C_{24}H_{32}ClFO_5$ 454.97

[3093-35-4]

Halcinonide is 21-chloro-9-fluoro-11β-hydroxy-16α,17-[(1-methylethylidene) dioxy] pregn-4-ene-3,20-dione. It contains not less than 97.0% and not more than 102.0% of $C_{24}H_{32}ClFO_5$, calculated on the dried basis.

Description A white or light yellow crystalline powder; odourless.

Soluble in chloroform; slightly soluble in methanol or ethanol; insoluble in water.

Specific optical rotation $+150^\circ$ to $+159^\circ$, in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Halcinonide (Appendix XVI).

(2) Yields the reaction characteristic of fluorinated compounds (Appendix III).

(3) Weigh about 15 mg, carry out the method for oxygen-flask combustion (Appendix VII C), using 20 ml of water as the absorbing liquid. The resulting solution yields the reactions characteristic of chlorides (Appendix III).

Fluorine content Carry out the limit test for fluorine (Appendix VIII E), the content of fluorine is not less than 3.4% and not more than 4.4%.

Related substances Carry out the method as described under Assay. Dissolve about 12.5 mg of the substance being examined, weighed accurately, in 19 ml of methanol in a 25 ml volumetric flask, dilute with water to volume and mix well as the test solution (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as the reference solution (2). Inject 20 μl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 50% of full scale of the chart. Inject separately accurately 20 μl each of the solution (1) and (2) into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak are not greater than 0.5 and 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection Wavelength is 240 nm. The number of the theoretical plates

of the column is generally 8000, calculated with reference to the peak of halcinonide. The resolution factor between the peaks of halcinonide and adjacent impurities should agree with the requirement.

Procedure Dissolve about 25 mg of the substance being examined, accurately weighed, in 74 ml of methanol in a 100 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 5 ml of the solution into a 50 ml volumetric flask, dilute with mobile phase to volume, mix well as the test solution. Inject 20 μ l of solution into the column and record the chromatogram. Repeat the operation using halcinonide CRS instead of the substance being examined, calculate the content of $C_{24}H_{32}ClFO_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in a tightly closed containers, protected from light.

Preparation (1) Halcinonide Cream
(2) Halcinonide Film
(3) Halcinonide Ointment
(4) Halcinonide Solution

Halcinonide Cream

Halcinonide Cream contains not less than 85.0% and not more than 115.0% of the labelled amount of halcinonide ($C_{24}H_{32}ClFO_5$).

Description White cream.

Identification In the chromatograms obtained in the Assay, the principal peak of the substance being examined is identical to that of halcinonide CRS in retention time.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 2000. The resolution factor between the peaks of halcinonide and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of progesterone in mobile phase to produce a solution of 0.15 mg per ml.

Procedure Dissolve a quantity of the cream, equivalent to about 1.25 mg of halcinonide, accurately weighed, in about 30 ml of methanol in a 50 ml volumetric flask and put on an 80°C water bath for 2 minutes and shake until halcinonide is dissolved, cool to room temperature, add accurately 5 ml of internal standard solution, dilute with methanol to volume, mix well and put in a ice water bath for at least 2 hours. Filter immediately and cool to room temperature, take the successive filtrate as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve about 12.5 mg of halcinonide CRS, accurately weighed, in methanol in a 100 ml volumetric flask and dilute with methanol to volume, mix well. Measure accurately 10 ml of the solution and 5 ml of internal standard solution into a 50 ml volumetric flask, dilute with methanol to volume, mix well as the reference solution. Repeat the operation using the reference solution, calculate the content of $C_{24}H_{32}ClFO_5$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Halcinonide.

Strength 10 g : 10 mg

Storage Preserve in tightly closed containers, protected from light and stored in cool place.

Halcinonide Film

Halcinonide film contains not less than 90.0% and not more than 110.0% of the labelled amount of halcinonide ($C_{24}H_{32}ClFO_5$).

Description A clear, colourless, slightly viscous liquid.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of halcinonide CRS.

Other requirements Comply with the general requirements for Films (Appendix I T).

Assay Dissolve a quantity of films equivalent to about 2.5 mg of halcinonide in the mobile phase in a 100 ml volumetric flask, dilute with the mobile phase to volume, mix well. Carry out the Assay described under Halcinonide. Inject 20 μ l of the resulting solution into the column and record the chromatogram. Dissolve about 25 mg of halcinonide CRS, accurately weighed, in 74 ml of methanol in a 100 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 5 ml of the solution into a 50 ml volumetric flask, dilute with the mobile phase to volume, mix well. Measure in the same manner, calculate the content of $C_{24}H_{32}ClFO_5$.

Category As described under Halcinonide.

Strength 10 g : 10 mg

Storage Preserve in tightly closed containers and stored in a cool place.

Halcinonide Ointment

Halcinonide Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of halcinonide ($C_{24}H_{32}ClFO_5$).

Description A white creamy ointment.

Identification (1) Dissolve a quantity equivalent to 2 mg of halcinonide with 50 ml of cyclohexane and 25 ml of methanol in a separator with shaking. Separate the lower layer into another separator containing 50 ml of 5% potassium aluminum sulfate solution. Extract the upper layer twice with 15 ml and 10 ml of a mixture of methanol-10% sodium chloride solution (5 : 1). Combine the lower layer into the above separator, extract with chloroform (50, 25, 5, 5 ml) for four times. Combine the chloroform extracts, filter through a funnel containing about 10 g of anhydrous sodium sulfate, collect the filtrate in a beaker, evaporate to dryness on a water bath. Dissolve the residue in 1 ml of chloroform-methanol (9 : 1) and use the resulting solution as the test solution. Dissolve a quantity of halcinonide CRS in chloroform-methanol (9 : 1) to make a solution of 2 mg per ml as the reference solution. Carry out the method of thin-layer chromatography (Appendix V B), using silica gel G as coating substance and chloroform-methanol (3 : 1) as the mobile phase. Apply 10 μ l each of above two solutions separately on the same plate. After developing and removal

of the plate, dry in air and heat at 105°C for 10 minutes, spray with alkaline tetrazolium blue TS and examine immediately. The colour and position of the principal spot of the two solutions should be identical in the chromatogram.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of halcinonide CRS.

Test (1) or (2) can be used alternatively.

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 2000. The resolution factor between the peaks of halcinonide and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of progesterone in mobile phase to produce a solution of 0.15 mg per ml.

Procedure Dissolve a quantity of the cream, equivalent to about 1.25 mg of halcinonide, accurately weighed, in about 30 ml of methanol in a 50 ml volumetric flask and put on an 80°C water bath for 2 minutes and shake until halcinonide is dissolved, cool to room temperature, add accurately 5 ml of internal standard solution, dilute with methanol to volume, mix well and put in a ice water bath for at least 2 hours. Filter immediately and cool to room temperature, take the successive filtrate as the test solution. Inject 20 µl into the column and record the chromatogram. Dissolve about 12.5 mg of halcinonide CRS, accurately weighed, in methanol in a 100 ml volumetric flask and dilute with methanol to volume, mix well. Measure accurately 10 ml of the solution and 5 ml of internal standard solution into a 50 ml volumetric flask, dilute with methanol to volume, mix well as the reference solution. Repeat the operation using the reference solution, calculate the content of $C_{24}H_{32}ClFO_5$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Halcinonide.

Strength 10 g : 10 mg

Storage Preserve in tightly closed containers, stored in cool place.

Halcinonide Solution

Halcinonide Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of halcinonide ($C_{24}H_{32}ClFO_5$).

Description A colourless, clear, slightly viscous liquid.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of halcinonide CRS.

Content Complies with the requirement of limit test for content (Appendix X F).

Microbial limit Complies with the requirements of microbial limit tests (Appendix XI J).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilanized silica gel and a mixture of methanol-water-ether (76 : 24 : 4) as the mobile phase. The detection wavelength is 238 nm. The theoretical plate should be not

lower than 2500, calculated with the reference to halcinonide. The resolution of halcinonide and the internal standard complies with the requirement. Dissolve a quantity of progesterone, accurately weighed, in methanol to make a solution of about 0.15 mg per ml as the internal standard solution.

Procedure Dissolve a quantity, accurately weighed of halcinonide CRS in methanol to make a solution of about 0.1 mg per ml. Measure accurately 10 ml of the solution and 5 ml of internal standard solution into a 50 ml volumetric flask and dilute to volume with methanol, shake well. Inject 20 µl into the column, record the chromatogram. Repeat the operation using a quantity of the substance being examined instead of Halcinonide CRS. Calculate the content of $C_{24}H_{32}ClFO_5$ correspondingly.

Category As described under Halcinonide.

Strength (1) 0.1% (2) 0.025%

Storage Preserved in tightly closed containers, protected from light.

Haloperidol

$C_{21}H_{23}ClFNO_2$ 375.87

[52-86-8]

Haloperidol is 4-[4-(4-chlorophenyl)-4-hydroxy-1-piperidinyl]-1-(4-fluorophenyl)-1-butanone. It contains not less than 98.5% of $C_{21}H_{23}ClFNO_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Soluble in chloroform; sparingly soluble in ethanol; slightly soluble in ether; practically insoluble in water.

Melting range 149-153°C (Appendix VI C).

Specific absorbance Protect from light throughout the procedure. Measure the absorbance of a solution of 15 µg per ml in a mixture of hydrochloric acid solution (9→100)-methanol (1 : 99) at 244 nm (Appendix IV A), the value of A (1%, 1 cm) is 338-360.

Identification (1) Rotate the test tube containing about 1 ml of saturated solution of chromium trioxide in sulfuric acid, the solution is spread evenly on the wall; add 2 mg of the substance being examined, heat gently, rotate the test tube, the solution can no longer be spread evenly on the wall, but attached to the wall with greasiness.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of haloperidol (Appendix XVI).

(3) Weigh about 20 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 5 ml of sodium hydroxide TS as the absorbing liquid. When the absorption is complete, acidify the liquid with dilute nitric acid, boil gently for 2 minutes, the resulting solution yields the reactions characteristic of chlorides (Appendix III).

Clarity of acidic solution Dissolve, with heating, 50 mg in 10 ml of lactic acid solution (0.5→100), the resulting solution is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the

coating substance and a mixture of chloroform-ethanol (8 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in chloroform containing (1) 10 mg per ml and (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. examine immediately. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2).

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay To about 0.2 g, accurately weighed, add 20 ml of glacial acetic acid and heat gently to dissolve. Allow to cool, add 2 drops of naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 37.59 mg of $C_{21}H_{23}ClFNO_2$.

Category Antipsychotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Haloperidol Tablets
(2) Haloperidol Injection

Haloperidol Injection

Haloperidol Injection is a sterile solution of Haloperidol in Water for Injection containing a quantity of lactic acid. It contains not less than 90.0% and not more than 110.0% of the labelled amount of haloperidol ($C_{21}H_{23}ClFNO_2$).

Description A clear, colourless solution.

Identification (1) Complies with test (1) for Identification described under Haloperidol, using 3 drops.
(2) Protect from light throughout the procedure. The light absorption of the solution obtained in the Assay exhibits a maximum at 244 nm and a minimum at 232 nm (Appendix IV A).

pH value 2.8-3.6 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protect from light throughout the procedure. Dilute a quantity, accurately measured, with a mixture of hydrochloric acid solution (9→100)-methanol (1 : 99) to produce a solution of 10 μ g of haloperidol per ml. Measure the absorbance of the resulting solution at 244 nm (Appendix IV A). Calculate the content of $C_{21}H_{23}ClFNO_2$, taking 353 as the value of A (1%, 1 cm).

Category As described under Haloperidol.

Strength 1 ml : 5 mg

Storage Preserve in well closed containers, protected from light.

Haloperidol Tablets

Haloperidol Tablets contain not less than 90.0%

and not more than 110.0% of the labelled amount of haloperidol ($C_{21}H_{23}ClFNO_2$).

Description Sugar-coated tablets with white cores.

Identification (1) Add 2 ml of chloroform to a quantity of powdered tablets equivalent to about 2 mg of haloperidol, shake, filter. Evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Haloperidol.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 244 nm and a minimum at 232 nm (Appendix IV A).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-ethanol (8 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of the following solutions: shake an accurately weighed quantity of the powdered tablets equivalent to about 10 mg of haloperidol with 10 ml of chloroform, filter, evaporate the filtrate to dryness and dissolve the residue in 1.0 ml of chloroform (solution 1); dilute a quantity of solution (1) with chloroform to produce a solution of 0.20 mg per ml (solution 2). After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS, examine immediately. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Content uniformity Protect from light throughout the procedure. Comply the requirements (Appendix X E), triturate 1 tablet with the coating removed with 1 ml of hydrochloric acid solution (9→100) for 2 minutes. Transfer in portions with the aid of 30 ml of methanol to a 50 ml volumetric flask, heat on a water bath with shaking to dissolve haloperidol, cool, add methanol to volume and mix well, filter. Measure accurately 5 ml of the successive filtrate to a 20 ml volumetric flask, add a mixture of hydrochloric acid solution (9→100)-methanol (1 : 99) to volume and mix well. Proceed as directed in the Assay and calculate the content of $C_{21}H_{23}ClFNO_2$.

Dissolution Protect from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 3), using 200 ml of hydrochloric acid (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate (for strength 4 mg) with the same volume of dissolution medium. Dissolve 25 mg of haloperidol CRS, accurately weighed, in a mixture solution of hydrochloric acid (9→100)-methanol (1 : 99) and dilute to volume in a 100 ml volume flask, mix well. Transfer 2 ml, accurately measured, to a 50 ml volume flask, dilute with hydrochloric acid (9→1000) to volume and mix well. Measure the absorbances of the resulting solutions at 248 nm (Appendix IV A), calculate the dissolution of $C_{21}H_{23}ClFNO_2$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder 20 tablets with coatings removed, weigh accurately a quantity of the powder equivalent to about 10 mg of haloperidol to a 100 ml volumetric flask, add 1 ml of hydrochloric acid solution (9→100), shake for 2 minutes and add 60 ml of methanol. Heat on a water bath with shaking to dissolve haloperidol, cool, add methanol to volume and mix well. Filter, measure accurately 10 ml of the successive filtrate to a 100 ml volumetric flask, add a mixture of hydrochloric acid solution (9→100)-methanol (1 : 99) to volume and mix well. Measure the absorbance of

the resulting solution at 244 nm (Appendix IV A). Calculate the content of $C_{21}H_{23}ClFNO_2$, taking 353 as the value of A (1%, 1 cm).

Category As described under Haloperidol.

Strength (1) 2 mg (2) 4 mg

Storage Preserve in tightly closed containers, protected from light.

Halothane

$C_2HBrClF_3$ 197.38 [151-67-7]

Halothane is 2-bromo-2-chloro-1,1,1-trifluoro ethane. It contains 0.01% (g/g) of thymol as stabilizer.

Description A clear, colourless, mobile, dense liquid; odour similar to chloroform; taste sweet. Miscible with ethanol, chloroform, ether or fixed oil; slightly soluble in water.

Relative density 1.871-1.875 (Appendix VI A).

Identification (1) To 1 ml in a test tube add 2 ml of sulfuric acid, the sample forms a layer under the acid (distinction from Methoxyflurane).

(2) Yields the reactions characteristic of organic fluoride compound (Appendix III).

Acidity Shake 20 ml with 20 ml of water for 3 minutes. Separate the water layer, add 2 drops of bromocresol purple IS and 0.10 ml of sodium hydroxide (0.01 mol/L) VS, a purple colour is produced.

Halides and free halogens Shake 15 ml with 30 ml of freshly boiled and cooled water for 3 minutes, then carry out the following tests.

(1) To 5 ml of the water layer add 5 ml of water, 1 drop of nitric acid and 0.2 ml of silver nitrate TS. Any opalescence produced is not more pronounced than that of the reference solution (to 5 ml of the water layer add 5 ml of water and 1 drop of nitric acid).

(2) To 10 ml of the water layer add 1 ml of cadmium iodide TS and 2 drops of starch IS, no blue colour is produced.

Thymol Dilute 1 ml, accurately measured, of a solution of 0.225% thymol in carbon tetrachloride to 10 ml with carbon tetrachloride and measure accurately 0.5 ml of this solution to a 25 ml stoppered Nessler cylinder (1). Dilute 1 ml, accurately measured, of a solution of 0.225% thymol in carbon tetrachloride to 15 ml with carbon tetrachloride and measure accurately 0.5 ml of this solution to a second 25 ml stoppered Nessler cylinder (2). Measure accurately 0.5 ml of the substance being examined to a third 25 ml stoppered Nessler cylinder (3). To each of the three cylinders add 5 ml of carbon tetrachloride and 5 ml of titanium sulfate TS, shake vigorously for 30 seconds, and allow to stand until the layers have separated. The intensity of the yellowish-brown colour of the lower layer in cylinder (3) lies between those produced in cylinders (1) and (2) (0.008%-0.0012%).

Non-volatile substances Evaporate 50 ml on a water bath and dry the residue at 105°C for 2 hours, the residue weighs not more than 1 mg.

Volatile impurities Carry out the method for gas chromatography (Appendix V E), using the substance being

examined and that containing 0.010% (ml/ml) of dichloromethane (internal standard), use trioctyl phosphate (25%) as the stationary phase. The number of theoretical plates of the column is not less than 750. Maintain the column temperature at 48-50°C. Record the peaks until the principal peak appears in the chromatogram. The results comply with the requirements.

Category Inhalant anaesthetic.

Strength (1) 20 ml (2) 100 ml

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Heavy Magnesium Carbonate

Heavy Magnesium Carbonate is a hydrated basic magnesium carbonate. It contains not less than 40.0% and not more than 43.5% of MgO .

Description A white, granular powder; odourless; almost tasteless.

Practically insoluble in water or ethanol; the aqueous solution exhibits weak alkaline reaction and dissolves in dilute acids with effervescence.

Identification It dissolves in dilute hydrochloric acid with effervescence; the solution yields the reactions characteristic of magnesium salts (Appendix III).

Chlorides Dissolve 0.2 g in 0.4 ml of nitric acid and quantity of water to produce 25 ml. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfates Dissolve 0.10 g in 1 ml of hydrochloric acid and a quantity of water, dilute to 25 ml with water. Carry out the limit test for sulfates (Appendix VIII B), using 10 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.5%).

Calcium oxide Weigh accurately about 0.5 g and carry out the test for calcium oxide described under magnesium oxide, not more than 0.6%.

Soluble salts Boil 1.0 g in 50 ml of water for 5 minutes, filter, evaporate the filtrate to dryness on a water bath, and dry for 1 hour at 105°C, the residue is not more than 10 mg (1.0%).

Acid-insoluble substances To 5 g add 75 ml of water, and add a small amount of hydrochloric acid in portions with stirring until no more is dissolved. Boil for 5 minutes and filter, wash the residue with water until the washing is free from chloride. Ignite the residue to constant weight; not more than 2.5 mg (0.05%).

Iron Boil 0.25 g in 5 ml of dilute nitric acid for 1 minute, allow to cool, dilute to 35 ml with water. Carry out the limit test for Iron (Appendix VIII G). Any colour produced is not more intense than that of a reference using 5.0 ml of iron standard solution (0.02%).

Heavy metals Boil 0.50 g in 5 ml of dilute hydrochloric acid and 10 ml of water for 5 minutes, cool and filter. To the filtrate add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution is pale red; add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. To the resulting solution add 0.5 g of ascorbic acid. Carry out the limit test for Heavy metals (Appendix VIII H, method 1), compare the colour of the two solutions after 5

minutes; not more than 0.003%.

Arsenic To 1.0 g add a quantity of water and hydrochloric acid dropwise to dissolve the substance being examined. add 5 ml of hydrochloric acid in excess and a quantity of water to produce 28 ml. Complies with the limit test for Arsenic (Appendix VIII J, method 1) (0.0002%).

Assay Dissolve about 1 g accurately weighed and moistened with 5 ml of water in 30 ml of sulfuric acid (0.5 mol/L) VS, accurately measured. Add 1 drop of methyl orange IS, titrate with sodium hydroxide (1 mol/L) VS. Each ml of sulfuric acid (0.5 mol/L) /VS is equivalent to 20.15 mg of MgO and 28.04 mg of CaO, calculate the difference between the total volume (ml) of sulfuric acid (0.5 mol/L) VS and the volume consumed by calcium oxide.

Category Antacid.

Storage Preserve in tightly closed containers.

Heparin Sodium

Heparin Sodium is the sodium salt of a sulfated glycosaminoglycan prepared from the intestinal mucosa of pigs, or oxen. It has a potency of not less than 150 Units per mg, calculated on the dried basis.

Description A white or almost white powder; hygroscopic. Freely soluble in water.

Specific optical rotation Not less than +35., in a solution of 40 mg per ml in water (Appendix VI E).

Identification (1) Dissolve separately the substance being examined and Heparin RS in water to produce a solution of 2.5 mg per ml. Carry out the method for electrophoresis (Appendix V F, method 3). The ratio of the distance migrated by the principal band obtained with substance being examined to the distance migrated by the principal band obtained with Heparin RS is 0.9-1.1.

(2) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, pH 5.0-7.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.50 g in 10 ml of water is clear and colourless, any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1). The absorbance of the solution at 640 nm (Appendix IV A) is not more than 0.018.

Light absorption The light absorption of a solution of 4 mg per ml in water exhibits maxima at 260 nm and 280 nm; the absorbance is not more than 0.20 and 0.15 respectively (Appendix IV A).

Viscosity Triturate an accurately weighed quantity equivalent to about 400000 Units with water, transfer the liquid to a previously dried and weighed 10 ml volumetric flask, wash the mortar with water and add the washings to the flask. Place the flask in a water bath at 25°C, add water (25°C) to volume and mix well. Weigh accurately and calculate the density of the solution. Filter the solution if necessary, through a 0.45 µm filter membrane. The kinetic viscosity of the solution at 25°C ± 0.1°C (Appendix VI G, method 1) is not more than 0.030 Pa · s.

Nitrogen content Carry out the method for determination of nitrogen (Appendix VII D, method 2): The total nitrogen content is not less than 1.3% and not more than 2.5%, calculated on the dried basis.

Sulfur Carry out the method for oxygen flask combustion (Appendix VII C), using a 1000 ml combustion flask and 0.1 ml of concentrated hydrogen peroxide solution and 10 ml of water as the absorbing liquid. When the combustion is complete, cool on ice bath for 15 minutes, heat gently to boil for 2 minutes and cool. Add 50 ml of ethanol-ammonium acetate buffer solution (pH 3.7), 30 ml of ethanol and 0.3 ml of 0.1% alizarin red solution as indicator solution. Titrate with barium perchlorate (0.05 mol/L) VS until the colour changes to orange-red. Each of barium perchlorate (0.05 mol/L) VS is equivalent to 1.603 mg of S. It contains not less than 10.0%.

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not less than 28.0% and not more than 41.0% (Appendix VIII N), using 0.50 g.

Potassium salt Test preparation (B): Dissolve 0.10 g in a 100 ml volumetric flask with water and dilute to volume, mix well.

Reference Preparation (A): Dissolve 191 mg of potassium chloride (AR), previously dried at 150°C for 1 hour and accurately weighed in a 1000 ml volumetric flask with water and dilute to volume, mix well. Transfer 5.0 ml of the solution to a 50 ml volumetric flask, add test preparation (B) to volume and mix well. Carry out the method for atomic absorption spectrophotometry (test for impurities) (Appendix IV A), the absorbance of the solutions, measured at 766.5 nm, complies with the requirement.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the substance obtained in the test for Residue on ignition; not more than 0.003%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.015 EU per Unit of heparin.

Assay Carry out the biological assay of heparin (Appendix XII D), the estimated potency is not less than 91% and not more than 110% of the labelled potency.

Category Anticoagulant.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation (1) Heparin Sodium Injection
(2) Heparin Sodium Cream

Heparin Sodium Cream

Heparin Sodium Cream contains not less than 86% and not more than 116% of the labelled amount of heparin sodium.

Description A white cream.

Identification (1) Dissolve a quantity equivalent to about 700 Units of heparin sodium in 10 ml of 60% ethanol by warming on a water bath and cool in a refrigerator at 4°C for 5 hours. Filter, use the filtrate as the test solution. Dissolve a quantity of heparin sodium RS in water to produce a reference solution containing 1.25 mg per ml. Apply separately to a gel plate 2 µl each of above two solutions. Carry out the method for electrophoresis (Appendix V F, method 3). The ratio of the mobility of the principal spot in the electrophoretogram obtained with the test solution to that in the electrophoretogram obtained with the reference solution is 0.9 to 1.1.

(2) The test solution obtained in identification test (1) yields the flame reaction characteristic of sodium salts

(Appendix III).

Acidity or alkalinity Dissolve 1 g in 10 ml of water, mix well. pH 6.5-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Dissolve about 2 g, accurately weighed, in 30 ml of dehydrated ethanol by warming on a water bath, allow to cool. Transfer the solution to a 100 ml volumetric flask, dilute with 0.9% sodium chloride solution to volume, mix well, cool in a refrigerator at 4°C overnight and filter. Evaporate 50 ml of the successive filtrate, accurately measured, on a water bath until no smell of ethanol. Transfer the remaining solution to a 50 ml volumetric flask, dilute with 0.9% sodium chloride solution to volume and mix well. Carry out the biological assay of Heparin (Appendix XI D), it complies with the requirement for potency.

Category Anticoagulant.

Strength (1) 20 g : 5000 Units of heparin sodium
(2) 20 g : 7000 Units of heparin sodium
(3) 25 g : 8750 Units of heparin sodium

Storage Preserve in tightly closed containers, stored in a cool place.

Heparin Sodium Injection

Heparin Sodium Injection is a sterile solution of Heparin Sodium in Water for Injections. It has a potency of not less than 86% and not more than 116% of the labelled potency.

Description A clear, colourless or pale yellow liquid.

Identification Yields the reactions characteristic of sodium salts (Appendix III).

pH value 5.5-8.5 (Appendix VI H).

Bacterial endotoxin Complies with the test for Bacterial endotoxin described under Heparin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the biological assay of heparin (Appendix XI D), it complies with the requirement.

Category As described under Heparin Sodium.

Strength (1) 2 ml : 1000 Units (2) 2 ml : 5000 Units
(3) 2 ml : 12500 Units

Storage Preserve in well closed containers, stored in a cool place, protected from light.

Histamine Phosphate

$C_5H_9N_3 \cdot 2H_3PO_4$ 307.14

[51-74-1]

Histamine Phosphate is 1*H*-imidazole-4-ethanamine phosphate. It contains not less than 98.0% of $C_5H_9N_3 \cdot 2H_3PO_4$, calculated on the dried basis.

Description Long prismatic crystals; odourless; deteriorated

on exposure to light; the aqueous solution yields an acidic reaction.

Freely soluble in water; slightly soluble in ethanol.

Melting range 126-132°C (Appendix VI C).

Identification (1) Dissolve 50 mg in 5 ml of hot water, add 10 ml of hot picronic acid solution (50 mg of picronic acid in 10 ml of hot ethanol), allow to stand until the crystallization is complete. Filter, wash the crystals with a small quantity of ice water and dry at 105°C for 1 hour; the melting range is 250-254°C, with decomposition (Appendix VI C).

(2) Dissolve about 5 mg in 7 ml of water and 3 ml of sodium hydroxide TS, add 50 mg of sulfanilic acid, 10 ml of water, and a mixture of 2 drops of hydrochloric acid and 2 drops of sodium nitrite solution (1→10), a red colour is produced.

(3) The aqueous solution yields the reactions characteristic of phosphates (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of water. Add 5 ml of chloroform, 25 ml of ethanol and 10 drops of thymolphthalein IS, titrate with sodium hydroxide (0.1mol/L) VS. Each ml of sodium hydroxide (0.1mol/L) VS is equivalent to 7.68 mg of $C_5H_9N_3 \cdot 2H_3PO_4$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Histamine Phosphate Injection

Histamine Phosphate Injection

Histamine Phosphate Injection is a sterile solution of Histamine Phosphate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of histamine phosphate ($C_5H_9N_3 \cdot 2H_3PO_4$).

Description A clear, colourless liquid; deteriorated on exposure to light.

Identification (1) Evaporate a quantity of the injection, equivalent to about 2 mg of histamine phosphate, on a water bath to dryness, the residue complies with test (2) for Identification described under Histamine Phosphate.

(2) Evaporate a quantity of the injection, equivalent to about 1 mg of histamine phosphate, on a water bath to about 1 ml, add dropwise ammonium molybdate TS; a yellow precipitate is produced and dissolved on adding ammonia TS.

pH value 3.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay *Reference preparation* Dissolve an accurately weighed amount of histamine phosphate CRS, in water to produce a solution of about 50 µg per ml.

Test preparation Measure accurately a quantity of the injection, equivalent to about 2.5 mg of histamine phosphate, to a 50 ml volumetric flask, dilute with water to volume, mix well.

Procedure Measure accurately 5 ml of each of two solutions to two 10 ml volumetric flasks, respectively, to each flask add 1 ml of 1% sodium borate solution and 1 ml of freshly prepared 0.5% β-naphthoquinone-4-sodium sulfonate solution,

both accurately measured. Place the flasks in boiling water bath immediately for 10 minutes. Then immerse them in ice-water bath (5-10°C) for 5 minutes. To each flask add 1 ml of acidic formaldehyde solution [to 45 ml of 1 mol/L hydrochloric acid solution, add 10 ml of glacial acetic acid and 0.5 ml of formaldehyde solution, dilute with water to 80 ml], mix well, add 1 ml of 0.1 mol/L sodium thiosulfate solution, dilute with water to volume and mix well. Measure the absorbances of the two solutions at 460 nm (Appendix IV B) immediately, calculate the content of $C_6H_9N_3O_2 \cdot 2H_3PO_4$.

Category As described under Histamine Phosphate.

Strength (1) 1 ml : 1 mg (2) 1 ml : 0.5 mg
(3) 5 ml : 0.2 mg

Storage Preserve in well closed containers, protected from light.

Histidine

$C_6H_9N_3O_2$ 155.16

Histidine is (S)-2-amino-3-(imidazol-4-yl) propanoic acid. It contains not less than 99.0% and not more than 101.0% of $C_6H_9N_3O_2$, calculated on the dried basis.

Description White crystals or crystalline powder; odourless; taste, slightly bitter. Soluble in water, very slightly soluble in ethanol, insoluble in ether.

Specific optical rotation +12.0° to +12.8°, in a solution of 0.11 g per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum is (Appendix IV C) is concordant with the spectrum of Histidine CRS (Appendix IV C).

Acidity or alkalinity Dissolve 1.0 g in 50 ml of water, pH 7.0-8.5 (Appendix VI H).

Transmittance of solution Dissolve 0.60 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-propyl alcohol-concentrated ammonia solution (67 : 33) as the mobile phase. Apply separately to

the plate 5 µl of each of two solutions in water containing (1) 10 mg per ml, (2) 50 µg per ml of the substance being examined. After developing and removal of the plate, dry in air, spray with ninhydrin acetone solution (1→50), heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.5%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 1.0 g; not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 30 mg per ml in Sodium chloride Injection per kg of the rabbit's weight.

Assay Dissolve about 0.15 g, accurately weighed, in 2 ml of dehydrated formic acid, add 50 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 15.52 mg of $C_6H_9N_3O_2$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Histidine Hydrochloride

$C_6H_9N_3O_2 \cdot HCl \cdot H_2O$ 209.63

Histidine hydrochloride is (S)-2-amino-3-(imidazol-4-yl) propanoic acid hydrochloride monohydrate. It contains not less than 98.5% of $C_6H_9N_3O_2 \cdot HCl \cdot H_2O$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly sour and bitter. Freely soluble in water, insoluble in ethanol, chloroform or ether.

Specific optical rotation +8.5° to +10.5°, in a solution of about 0.11 g per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of histidine hydrochloride monohydrate (Appendix XVI).

Acidity Dissolve 1.0 g in 10 ml of water, pH 3.5-4.5 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorine Content Dissolve about 0.4 g, accurately weighed, in 50 ml of water, add 2 ml of dilute nitric acid. Carry out the method for potentiometric titration (Appendix VI A), titrate with silver nitrate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of chlorine. It contains not less than 16.7% and not more than 17.1% of chlorine, calculated on the dried basis.

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-acetone-concentrated ammonia solution-water (10 : 10 : 5 : 2) as the mobile phase. Apply separately to the plate 2 μ l of each of the two solutions in water containing (1) 50 mg per ml and (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with ninhydrin acetone solution (1 \rightarrow 50), heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.2%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens Complies with the test for pyrogens (Appendix XI-D), using 10 ml of a solution of 35 mg per ml in Sodium Chloride Injection, per kg of the rabbit's weight.

Assay Dissolve about 0.2 g, accurately weighed, in 5 ml of water, add a mixture of 1 ml of formaldehyde TS and 20 ml of ethanol (neutralized to phenolphthalein), add several drops of phenolphthalein IS. Titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 10.48 mg of $C_{29}H_{39}NO_9 \cdot HCl \cdot H_2O$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Homoharringtonine

$C_{29}H_{39}NO_9$ 545.63

Homoharringtonine is an alkaloid extracted from *Cephalotaxus fortunei* Hook. f. or other plants of the same genus. It contains not less than 95.0% and not more than 103.0% of $C_{29}H_{39}NO_9$, calculated on the dried basis.

Description An almost white or pale yellow, crystalline powder or amorphous friable solid; hygroscopic; darkens on exposure to light.

Freely soluble in chloroform, ethanol or methanol; slightly soluble in ether or water.

Melting range 143-147°C (Appendix VI C).

Identification (1) Dissolve about 0.5 mg in 1 ml of water, add 1 drop of potassium iodobismuthate TS, an orangish-red precipitate is produced.

(2) To about 1 mg, add about 1 mg of chromotropic acid and 5-10 drops of sulfuric acid. Heat in a water bath at 50-60°C for a few minutes, a reddish-violet colour is produced.

(3) Dissolve about 2 mg in 1 ml of dehydrated ethanol, add a few drops each of an ethanol solution saturated with hydroxylamine hydrochloride and an ethanol solution saturated with potassium hydroxide. Heat gently until bubbles are produced, cool, acidify with dilute hydrochloric acid. Add 1 drop of ferric chloride TS, a reddish-brown colour is produced.

(4) The light absorption of the solution obtained in the Assay exhibits maxima at 240 nm and 291 nm (Appendix IV A).

(5) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of homoharringtonine (Appendix XI).

Clarity of solution A solution of 10 mg in 10 ml of 0.1% tartaric acid solution is clear.

Related substances Dissolve a quantity of the substance being examined in the mobile phase to produce solutions of 1 mg per ml (solution 1) and 10 μ g per ml (solution 2). Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (40 : 60) as the mobile phase, adjust pH to 2.5 with phosphoric acid. Detection wavelength is 288 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to peak of homoharringtonine. Inject 20 μ l of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 μ l of solution (1) and solution (2) into the column and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks in the chromatogram obtained with solution (1) other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight in vacuum over phosphorus pentoxide, loses not more than 2.0% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity of the substance being examined in dehydrated ethanol to produce a solution of about 60 µg per ml. Measure the absorbance at 291 nm (Appendix IV A) and calculate the content of $C_{29}H_{39}NO_9$, taking 76 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light, stored in a cool place.

Preparation Homoharringtonine Injection

Homoharringtonine Injection

Homoharringtonine Injection is a sterile solution of Homoharringtonine in Water for Injections. It contains not less than 90.0% and not more than 110.0% of the labelled amount of homoharringtonine ($C_{29}H_{39}NO_9$).

Description A clear, colourless liquid.

Identification (1) To 1 ml, add 1 drop of potassium iodobismuthate TS, an orangish-red precipitate is produced. (2) The light absorption of the solution obtained in the Assay exhibits maxima at 242 nm and 288 nm (Appendix IV A).

pH value 3.5-4.5 (Appendix VI H).

Related substance Take the substance being examined as solution (1) and dilute a quantity of solution (1) with the mobile phase to produce a solution of 30 µg per ml as solution (2). Carry out the Related Substance as described under Homoharringtonine. The sum of the areas of all peaks in the chromatogram obtained with solution (1) other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 25 EU per mg of homoharringtonine.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To an accurately measured quantity add 0.01 mol/L hydrochloric acid solution to produce a solution containing 50 µg of homoharringtonine per ml. Measure the absorbance at 288 nm (Appendix IV A) and calculate the content of $C_{29}H_{39}NO_9$, taking 65 as the value of A (1%, 1 cm).

Category As described under Homoharringtonine.

Strength (1) 1 ml : 1 mg (2) 2 ml : 2 mg

Storage Preserve in tightly closed containers, protected from light, stored in a cool place.

Huperzine A

$C_{15}H_{18}N_2O$ 242.32

Huperzine A is (5R,9R,11E)-5-amino-11 ethylidene-5,8,9,10-tetrahydro-7-methyl-5,9 methanocyclooctatetraene [b] pyridine-2 (1H)-one. It contains not less than 97.0% and not more than 102.0% of $C_{15}H_{18}N_2O$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter; hygroscopic. Freely soluble in methanol; soluble in ethanol; insoluble in water; slightly soluble in 0.01 mol/L hydrochloric acid solution.

Identification (1) To about 0.2 mg, add 5 drops of ethanol to dissolve huperzine A, add 2 drops of potassium iodobismuthate TS, an orange yellow precipitate is produced. (2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of huperzine A CRS. (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of huperzine A (Appendix XVI).

Clarity of acidic solution Dissolve 5 mg in 5 ml of 0.1 mol/L hydrochloric acid solution, the solution is clear.

Related substances Dissolve a quantity of the substance being examined in 0.01 mol/L hydrochloric acid solution, to produce a solution of 0.1 mg per ml as test solution. Dilute a quantity of the test solution, accurately measured, with 0.01 mol/L hydrochloric acid solution to produce a solution of 2.5 µg per ml as reference solution. Carry out the method as described under Assay. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 20 µl each of the test solution and the reference solution into the column separately, and record the chromatograms for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying when dried in vacuum to constant weight at 80°C, loses not more than 4.0% of its weight (Appendix VIII L), using 0.3 g.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-phosphate buffer (dissolve potassium dihydrogen phosphate 2.72 g in 1000 ml of water, adjust to pH 2.5 with phosphoric acid) (14 : 86) as the mobile phase. Detection wavelength is 310 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of huperzine A.

procedure Weigh accurately a quantity of the substance being examined, dissolve in 0.01 mol/L hydrochloric acid solution to produce a solution of 40 µg per ml. Inject 20 µl of the resulting solution into the column and record the peak area. Repeat the operation, using the huperzine A CRS instead of the substance being examined. Calculate the content of $C_{15}H_{18}N_2O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Cholinesterase inhibitor.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Huperzine A Tablets
(2) Huperzine A Injection
(3) Huperzine A Capsules

cool and dry place, protected from light.

Huperzine A Capsules

Huperzine A capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of huperzine A ($C_{15}H_{18}N_2O$).

Description Capsules containing white or almost white granules or powder.

Identification (1) Shake a quantity of the contents, equivalent to about 0.1 mg of huperzine A, with 3 ml anhydrous ethanol, treated with aid of ultrasonicator to dissolve huperzine, centrifuge. To the supernatant add 2 drops of potassium iodobismuthate TS, an orange yellow precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of huperzine A CRS.

Related substances To a quantity of the contents, add 0.01 mol/L hydrochloric acid solution to produce a solution of about 20 μ g per ml, filter, taking the successive filtrate as test solution. Measure accurately a quantity of the resulting solution, dilute with the same solvent to produce a solution of 0.8 μ g per ml as reference solution. Carry out the method as described under Assay. Inject 50 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% full scale of the chart. Inject 20 μ l each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak, the solvent peak, and the ingredient peaks (the relative retention time of ingredient to principal peak is equal or less than 0.2) is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer the content of 1 capsule to a 10 ml volumetric flask, wash the shell with 0.01 mol/L hydrochloric acid solution in divided portions, transfer the washings to the same volumetric flask, add a quantity of 0.01 mol/L hydrochloric acid solution, treated with aid of ultrasonicator to dissolve huperzine A, dilute with 0.01 mol/L hydrochloric acid solution to volume and shake thoroughly, filter, taking the successive filtrate as test solution. Carry out the method as described under Assay and calculate the content of $C_{15}H_{18}N_2O$.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately and powder the contents of 20 capsules. Weigh accurately a quantity of the powder, equivalent to about 100 μ g of huperzine A, into a 20 ml volumetric flask, add a quantity of 0.01 mol/L hydrochloric acid solution, treated with aid of ultrasonicator to dissolve huperzine A, dilute with 0.01 mol/L hydrochloric acid solution to volume, shake thoroughly and filter. Carry out the method for Assay as described under Huperzine A. Inject 50 μ l of successive filtrate into the column and record the peak area. Repeat the operation, using huperzine A CRS instead of the substance being examined. Calculate the content of $C_{15}H_{18}N_2O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Huperzine A.

Strength 50 μ g

Storage Preserve in tightly closed containers, stored in a

Huperzine A Injection

Huperzine A injection is a sterile solution of Huperzine A in water for injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of huperzine A ($C_{15}H_{18}N_2O$).

Description A clear, colourless liquid.

Identification (1) To about 1 ml add 2 drops of potassium iodobismuthate TS, an orange yellow precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of huperzine A CRS.

pH value 3.5-6.5 (Appendix VI H)

Related substances To a quantity, dilute with 0.01 mol/L hydrochloric acid solution to produce a solution of 0.1 mg per ml as test solution. Measure accurately a quantity of the resulting solution, dilute with the same solvent to produce a solution of 4 μ g per ml as reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 20 μ l each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of the principal peak. The sum of the secondary peak other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection, add 0.01 mol/L hydrochloric acid solution to produce a solution of 40 μ g per ml as test solution. Carry out the method as described under Huperzine A, calculate the content of $C_{15}H_{18}N_2O$.

Category As described under Huperzine A.

Strength 1 ml : 0.2 mg

Storage Preserve in well closed containers, protected from light.

Huperzine A Tablets

Huperzine A Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of huperzine A ($C_{15}H_{18}N_2O$).

Description White tablets.

Identification (1) Shake a quantity of the powdered tablets, equivalent to about 0.1 mg of huperzine A, with 3 ml anhydrous ethanol, treated with aid of ultrasonicator to dissolve huperzine, centrifuge. To the supernatant liquid add 2 drops of potassium iodobismuthate TS, an orange yellow precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of huperzine A CRS.

Related substances To a quantity of powdered tablets add

0.01 mol/L hydrochloric acid solution to produce a solution of about 20 µg per ml, filter, taking the successive filtrate as test solution. Measure accurately a quantity of the resulting solution, dilute with the same solvent to produce a solution of 0.8 µg per ml as reference solution. Carry out the method as described under Assay. Inject 50 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 50 µl each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of principal peak. The sum of the areas of all peaks other than the principal peak, the solvent peak, and the ingredient peaks (the relative retention time of ingredient to principal peak is equal or less than 0.2) is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 10 ml volumetric flask, add a quantity of 0.01 mol/L hydrochloric acid solution, treated with aid of ultrasonicator to dissolve huperzine A, dilute with 0.01 mol/L hydrochloric acid solution to volume and shake thoroughly filter, taking the successive filtrate as test solution. Carry out the method as described under Assay and calculate the content of $C_{15}H_{18}N_2O$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets, equivalent to about 100 µg of huperzine A, into a 20 ml volumetric flask, add a quantity of 0.01 mol/L hydrochloric acid solution and treated with aid of ultrasonicator to dissolve huperzine A, dilute with 0.01 mol/L hydrochloric acid solution to volume, shake thoroughly and filter. Carry out the method as described under Huperzine A. Inject 50 µl of successive filtrate into the column and record the peak area. Repeat the operation, using the huperzine A CRS instead of the substance being examined. Calculate the content of $C_{15}H_{18}N_2O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Huperzine A.

Strength 50 µg

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Hyaluronidase

Hyaluronidase is an enzyme, prepared from the mammalian testes and capable of hydrolyzing mucopolysaccharide of the type of hyaluronic acid. It contains not less than 300 Units per mg.

Description A white to slightly yellow powder; odourless. Freely soluble in water; insoluble in ethanol, acetone or ether.

Identification (1) Dissolve a quantity in phosphate BS (Appendix XIII C) to produce a solution of 500-1000 Units per ml. Add 1 ml of the resulting solution to each of two test tubes, boil one of them and cool. To each test tube add 1 ml of potassium hyaluronate stock solution (Appendix XIII C), mix well. Place the tubes in a water bath maintained at 37°C for 30 minutes, remove the tubes from the water bath and add 1 ml of serum solution (Appendix XIII C) to each tube,

mix well. The solution has not been boiled is clearer.

(2) Inject intracutaneously 0.1 ml of sodium chloride injection containing 0.25% of methylene blue into each of two spots on the back of a healthy guinea pig as control. Inject intracutaneously 0.1 ml of the same solution with further addition of 10 Units of hyaluronidase into each of another two spots crossed over to the above control spots on the back of the same guinea pig as the test spots. The distance between any two of the four spots should be more than 3 cm. Kill and skin the guinea pig 5 minutes after the injections were completed. Examine the diffusion of methylene blue on the peeled skin from the back surface, the size of the test spots should be larger than that of the control spots.

Acidity or alkalinity pH 4.5-7.5, using a solution of 3 mg per ml in water (Appendix VI H).

Clarity and colour of solution A solution of 0.1 g in 10 ml of water is clear; any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A, method 1).

Light absorption The light absorbance of a solution of 300 Units per ml in freshly boiled and cooled water is not greater than 0.6 at 280 nm and not greater than 0.42 at 260 nm (Appendix IV A).

Tyrosine Evaporate, at 105°C, 1 ml of a solution containing 5 mg of hyaluronidase in a centrifuge tube to dryness. Add 0.2 ml of 6 mol/L sodium hydroxide solution and heat in saturated steam at 121°C for 3 hours or in a water bath for 4-5 hours. Cool and add 0.3 ml of 3.5 mol/L sulfuric acid; 1.5 ml of water and 1.5 ml of 15% mercuric sulfate solution in 2.5 mol/L sulfuric acid. Heat in a water bath for 10 minutes, cool to room temperature and add 1 ml of 3.5 mol/L sulfuric acid solution and 1 ml of 0.2% sodium nitrite solution, shake. Add water immediately to produce 6 ml, shake and centrifuge. Pipet the supernatant liquid at twenty minutes after the addition of water and measure its absorbance at 540 nm (Appendix IV A). Repeat the operation, replacing the substance being examined by 1 ml of water; use 1.5 ml of a 30 µg per ml solution of tyrosine CRS in 0.2 mol/L sulfuric acid solution in place of 1.5 ml of water. The content of tyrosine is not more than 0.1 µg per Unit;

$$\text{Content of tyrosine } (\mu\text{g/Unit}) = \frac{(T/S) \times 45}{W (\text{mg}) \times U}$$

Where *T* is absorbance of the test solution;
S is absorbance of the reference solution;
W is weight of the substance being examined;
U is Units per mg.

Undue toxicity Inject subcutaneously 0.25 ml of a solution of 10000 Units per ml in sodium chloride injection into each of five healthy mice with body weight between 17-22 g, no necrosis of the skin or death is observed within 48 hours. If one of the mice develops necrosis or dies, repeat the test and the sample complies with the requirements if none of the second group of five mice develops necrosis or dies within 48 hours.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XII E); less than 0.2 EU per Unit of hyaluronidase.

Assay Carry out the assay of hyaluronidase (Appendix IX C).

Category Proteolytic enzyme.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Preparation Hyaluronidase for Injection

Hyaluronidase for Injection

Hyaluronidase for Injection is a sterile lyophilized product with the addition of a suitable excipient. It contains not less than 90.0% and not more than 120.0% of the labelled potency.

Description A white or almost white lyophilized mass or powder.

Identification Complies with the tests for Identification as described under Hyaluronidase.

Acidity or alkalinity Dissolve each container in 2 ml of water, pH 6.0-7.5 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 5.0% of its weight (Appendix VIII L).

Bacterial endotoxin Complies with the test for bacterial endotoxin described under Hyaluronidase.

Other requirements Complies with the general requirements for injections (Appendix I B), except the weight variation of contents.

Assay Dissolve the contents of 3 containers separately in cold dilute solution of hydrolyzed gelatin to produce a solution containing 1.5 Units per ml, carry out the assay of hyaluronidase (Appendix XIII C). The potency of the contents of each container complies with the requirement. If the content of one of the three containers fails to pass the test, repeat the assay with another 3 containers. The potency of each container of the second group complies with the requirement.

Category As described under Hyaluronidase.

Strength (1) 150 Units (2) 1500 Units

Storage Preserve in well closed containers, stored in a dry and cool place.

Hydralazine Hydrochloride

$C_8H_8N_4 \cdot HCl$ 196.64

[304-20-1]

Hydralazine Hydrochloride is 1-hydrazinophthalazine monohydrochloride. It contains not less than 98.0% and not more than 102.0% of $C_8H_8N_4 \cdot HCl$, calculated on the dried basis.

Description A white to pale yellow crystalline powder; odourless.

Soluble in water; slightly soluble in ethanol; very slightly soluble in ether.

Identification (1) Dissolve about 10 mg in 2 ml of water in test tube, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(2) To 10 mg add 5 ml of water, 2 drops of dilute hydrochloric acid and a few drops of ferric chloride TS,

neutralize with sodium hydroxide TS, the colour of the solution becomes red and then changes to blue.

(3) The light absorption of a solution of 10 μ g per ml in water exhibits maxima at 260 nm, 303 nm and 315 nm.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hydralazine hydrochloride (Appendix XVI).

(5) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 25 ml of water, pH 3.5-4.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.20 g in 10 ml of water is clear and colourless; any colour produced is not more intense than that of reference solution Y4 (Appendix IX A, method 1).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 2 ml of potassium sulfate standard solution (0.04%).

Free hydrazine To 0.10 g add 5 ml of water and 0.1 ml of a solution of salicylaldehyde in ethanol (1→20); no turbidity is produced within 1 minute.

Water insoluble substances To 2.0 g add 100 ml of water, shake for 30 minutes to dissolve hydralazine hydrochloride. Filter with a No. 5 sintered glass filtering crucible previously dried to constant weight. Wash the residue with 10 ml each of water for three times, dry it to constant weight at 105°C; the residue does not exceed 10 mg (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in water in a 100 ml volumetric flask, dilute to volume and mix well. Measure accurately 25 ml of the resulting solution to an iodine flask, add 25 ml of bromine (0.05 mol/L) VS, accurately measured, and 5 ml of hydrochloric acid, stopper immediately and mix well, allow to stand in the dark place for 15 minutes. Add 7 ml of potassium iodide TS, stopper the flask immediately, mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch TS as the end point and continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 4.916 mg of $C_8H_8N_4 \cdot HCl$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Preparation Hydralazine Hydrochloride Tablets

Hydralazine Hydrochloride Tablets

Hydralazine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of hydralazine hydrochloride ($C_8H_8N_4 \cdot HCl$).

Description White or almost white tablets, or sugar coated tablets with white or almost white core.

Identification Shake a quantity of the powdered tablets equivalent to about 30 mg of hydralazine hydrochloride with 10 ml of water, filter. The filtrate complies with test (1) and (2) for Identification described under Hydralazine Hydrochloride.

Dissolution Carry out dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution at 30 minutes (60 minutes for sugar coated tablets) and filter. Dilute a quantity of the successive filtrate, accurately measured, to produce a solution of 10-20 µg per ml. Dissolve hydralazine hydrochloride CRS previously dried to constant weight at 105°C in hydrochloric acid solution (9→1000) to produce a solution of 10-20 µg per ml. Measure the absorbances of the resulting solutions at 260 nm (Appendix IV A). Calculate the dissolution of $C_8H_8N_4 \cdot HCl$ from each tablet. Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder (Sugar tablets with coating removed) 25 tablets (10 mg) or 10 tablets (25 mg or 50 mg). Triturate an accurately weighed quantity of the powder equivalent to about 0.1 g of hydralazine hydrochloride in a mortar with a small quantity of water and transfer to a 50 ml volumetric flask, wash the mortar with water in portions, add washings to the volumetric flask, dilute with water to volume and mix well. Filter with dry filter paper. Measure accurately 25 ml of the successive filtrate, proceed as described under Hydralazine Hydrochloride beginning at the words "to an iodine flask, add 25.0 ml of bromine (0.05 mol/L) VS...". Each ml of bromine (0.05 mol/L) VS is equivalent to 4.916 mg of $C_8H_8N_4 \cdot HCl$.

Category, Storage As described under Hydralazine Hydrochloride.

Strength (1) 10 mg (2) 25 mg (3) 50 mg

Hydrochlorothiazide

$C_7H_8ClN_3O_4S_2$ 297.74

[58-93-5]

Hydrochlorothiazide is 6-chloro-3,4-dihydro-2H-1,2,4-benzothiazine-7-sulfonamide-1,1-dioxide. It contains not less than 98.5% and not more than 101.5% of $C_7H_8ClN_3O_4S_2$, calculated on the dried basis.

Description A white, crystalline powder; odourless; taste, slightly bitter. Soluble in acetone; slightly soluble in ethanol; insoluble in water, chloroform or ether; soluble in sodium hydroxides solution.

Melting range 265-273°C, with decomposition (Appendix VI C).

Identification (1) Boil about 20 mg with 3 ml of sodium hydroxide TS for 5 minutes and cool. Acidify one half of the resulting solution with hydrochloric acid, add 0.25 ml of 4% sodium nitrite solution, mix well, add 0.2 ml of 10% ammonium sulphamate solution and again mix well. Add 1 ml of freshly prepared 0.5% chromotropic acid solution and

5 ml of sodium acetate TS, a red colour is produced. To the other half of the resulting solution add 5 ml of chromotropic acid TS, warm on a water bath, a bluish-violet colour is produced.

(2) Mix about 50 mg with 0.2 g of sodium carbonate and heat on a flame until it carbonizes completely. Allow to cool, add 5 ml of water, boil, cool and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Chlorides To 0.50 g add 20 ml of water, shake and filter. Carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Primary aromatic amine Dissolve 80 mg in acetone in a 100 ml volumetric flask, add acetone to volume, mix well. To 1 ml, accurately measured, of this solution add 9 ml of 1 mol/L hydrochloric acid solution and 0.1 ml of 4% sodium nitrite solution, mix well and allow to stand for 1 minute. Add 0.2 ml of 10% ammonium sulphamate solution, mix well and allow to stand for 3 minutes. Add 0.8 ml of 2% N-(1-naphthyl)-ethylenediamine dihydrochloride solution in dilute ethanol, mix well and allow to stand for 2 minutes. Measure immediately the absorbance of the resulting solution at 518 nm (Appendix IV A); not greater than 0.10.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 7 ml of sodium hydroxide TS, add water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 3); not more than 0.0015%.

Assay Weigh accurately about 0.12 g, carry out the Assay described under Bendroflumethiazide. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 14.89 mg of $C_7H_8ClN_3O_4S_2$.

Category Diuretic and antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Hydrochlorothiazide Tablets

Hydrochlorothiazide Tablets

Hydrochlorothiazide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 50 mg of hydrochlorothiazide add 10 ml of sodium hydroxide TS, shake to dissolve hydrochlorothiazide and filter, comply with test (1) for Identification described under Hydrochlorothiazide using 3 ml beginning at the words "boil for 5 minutes...".

Dissolution Comply with the dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (to 24 ml of dilute hydrochloric acid add water to produce 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 150 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate with the same dissolution medium to produce a solution of 5-10 µg per ml. Measure the absorbance of the resulting solution at 272 nm (Appendix IV A). Calculate the dissolution of $C_7H_8ClN_3O_4S_2$ from each

tablet, taking 640 as the value of A (1%, 1 cm): not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to about 20 mg of hydrochlorothiazide, accurately weighed, into a 100 ml volumetric flask add a quantity of hydrochloric acid solution (add water to 24 ml of dilute hydrochloric acid to produce 1000 ml) and shake in a warm water bath to dissolve, allow it to cool, dilute with the same solvent to volume, shake well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute to volume with the same solvent and mix well. Measure the absorbance at 272 nm (Appendix IV A). Calculate the content of $C_{17}H_{25}ClN_2O_4S_2$, taking 640 as the value of A (1%, 1 cm).

Category As described under Hydrochlorothiazide.

Strength (1) 10 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone

$C_{21}H_{30}O_5$ 362.47

[50-23-7]

Hydrocortisone is $11\beta,17\alpha,21$ -trihydroxypregn-4-ene-3,20-dione. It contains not less than 97.0% and not more than 103.0% of $C_{21}H_{30}O_5$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless at first but subsequently a bitter taste persists; deteriorates gradually on exposure to light. Sparingly soluble in ethanol or acetone; slightly soluble in chloroform; practically insoluble in ether; insoluble in water.

Specific optical rotation $+162^\circ$ to $+169^\circ$, in a solution of 10 mg per ml in dehydrated ethanol (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in dehydrated ethanol at 242 nm (Appendix IV A), the value of A (1%, 1 cm) is 422-448.

Identification (1) Dissolve about 0.1 mg in 1 ml of ethanol, add 8 ml of freshly prepared phenylhydrazine sulfate TS, heat at 70°C for 15 minutes, a yellow colour is produced.

(2) Dissolve about 2 mg in 2 ml of sulfuric acid, allow the solution to stand for 5 minutes; a brownish-yellow or red colour is produced with green fluorescence. Pour the solution into 10 ml of water, the colour changes to yellow or orangish-yellow with a faint green fluorescence and a small amount of flocculent precipitate.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hydrocortisone (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of tetrahydrofuran-water (19 : 81) as the mobile phase.

Detection wavelength is 254 nm. The resolution factor between the peaks of prednisolone and hydrocortisone should be greater than 2.4.

Procedure Dissolve about 12.5 mg of the substance being examined, weighed accurately, in 5 ml of tetrahydrofuran to a 25 ml volumetric flask and dilute with water to volume, mix well as solution (1). Dissolve about 12.5 mg of prednisolone CRS, weighed accurately, in 10 ml of tetrahydrofuran in a 50 ml volumetric flask and dilute with water to volume, mix well as solution (2). Measure accurately 1 ml each of solution (1) and (2) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (3). Inject 20 μ l of solution (3) into the column, adjust the attenuation so that the peak height of hydrocortisone in the chromatogram is about 30% of full scale of the chart and the resolution factor between the peaks of prednisolone and hydrocortisone should be greater than 2.4. Inject separately accurately 20 μ l each of the solution (1) and (3) into the column and record the chromatogram for 3.5 times the retention time of the peak of hydrocortisone. If there is any other peak except the peak of hydrocortisone in the chromatogram obtained with solution (1), its area corresponding to the peak of prednisolone in the chromatogram obtained with solution (3) is not greater than 0.5%, calculated by the external standard method. The area of any other simple impurity peak is not larger than 1/2 of the area of the peak of hydrocortisone in the chromatogram obtained with solution (3), the sum of the areas of any impurity peaks is not greater than 1.5 times of the area of the peak of hydrocortisone in the chromatogram obtained with solution (3).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of hydrocortisone. The resolution factor between the peaks of hydrocortisone and internal standard complies with related requirements.

Internal Standard Solution Dissolve norethisterone in methanol to produce a solution of 0.40 mg per ml.

Procedure Dissolve an accurately weighed quantity of hydrocortisone CRS in methanol to produce a solution of about 0.50 mg per ml, as the reference solution. Measure accurately 5 ml each of reference solution and internal standard solution to a 25 ml volumetric flask, dilute with methanol to volume, mix well. Inject 5-10 μ l of the resulting solution into the column and record the chromatogram. Repeat the operation using a quantity of the substance being examined instead of hydrocortisone CRS, accurately weighed. Calculate the content of $C_{21}H_{30}O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Hydrocortisone Cream
(2) Hydrocortisone Injection
(3) Hydrocortisone Tablets

Hydrocortisone Cream

Hydrocortisone Ointment contains not less than

90.0% and not more than 110.0% of the labelled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Description Creamy white cream.

Identification To about 5 g of the ointment in a beaker, add 30 ml of dehydrated ethanol and warm on a water bath by heating, allow to cool in an ice bath, filter and evaporate the filtrate to dryness. The residue complies with following tests.

(1) To a quantity of the residue, add 1 ml of ethanol, and 8 ml of phenylhydrazine sulfate, freshly prepared; then heat for 15 minutes at 70°C, a yellow colour is produced.

(2) To a quantity of the residue, add 2 ml of sulfuric acid and mix well, allow to stand for 5 minutes, and a yellow or brownish-yellow colour with green fluorescence is produced.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay *Reference preparation* Dissolve 20 mg of hydrocortisone CRS, accurately weighed, in a 100 ml volumetric flask in dehydrated ethanol, and dilute to volume with the same solvent, mix well.

Test preparation To a quantity of the cream, equivalent to 20 mg of hydrocortisone, accurately weighed, in a beaker, add 30 ml of dehydrated ethanol, Heat on a water bath and effect the dissolution of hydrocortisone acetate, cool in an ice bath and filter into a 100 ml volumetric flask. Repeat the extraction for 3 times, combine all filtrates, dilute with dehydrated ethanol to volume and mix well.

Procedure To 1 ml each of the two preparations, accurately measured, in separate stoppered test tubes, add accurately 9 ml of dehydrated ethanol and 1 ml of triphenyltetrazolium chloride TS and mix well; then add accurately 1 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark place at 25°C for 40-45 minutes and measure the absorbances at 485 nm (Appendix IV A). Calculate the content of $C_{21}H_{30}O_5$.

Category As described under Hydrocortisone.

Strength (1) 10 g : 25 mg (2) 10 g : 50 mg
(3) 10 g : 100 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone Injection

Hydrocortisone Injection is a sterile solution of Hydrocortisone in dilute ethanol. It contains not less than 93.0% and not more than 107.0% of the labelled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Description A clear, colourless liquid.

Identification Evaporate 1 ml to dryness on a water bath, the residue complies with tests (1) and (2) for Identification described under Hydrocortisone.

Ethanol Not less than 47% and not more than 55% (Appendix VII E).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 1 EU per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To 5 ml of the injection, accurately measured, in a 100 ml volumetric flask add dehydrated ethanol to volume and mix well. Transfer 5 ml of the solution, accurately measured, into another 100 ml volumetric flask, add

dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 242 nm (Appendix VIII A). Calculate the content of $C_{21}H_{30}O_5$, taking 435 as the value of A (1%, 1 cm).

Category Corticosteroid.

Strength (1) 2 ml : 10 mg (2) 5 ml : 25 mg
(3) 10 ml : 50 mg (4) 20 ml : 100 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone Tablets

Hydrocortisone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Description White tablets.

Identification Triturate a quantity of powdered tablets equivalent to 5 mg of hydrocortisone with 5 ml of dehydrated ethanol and filter. Evaporate the filtrate to dryness on a water bath, the residue complies with tests (1) and (2) for Identification described under Hydrocortisone.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotation speed of the paddle to 50 rpm. Withdraw proper quantities of the solution at 30 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with water to 10 ml and mix well. Measure the absorbance at 248 nm (Appendix IV A). Calculate the dissolution of $C_{21}H_{30}O_5$ from each tablet, taking 449.3 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed amount of the powder equivalent to 20 mg of hydrocortisone into a 100 ml volumetric flask. Add 75 ml of dehydrated ethanol, shake for 1 hour, add dehydrated ethanol to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, into another 100 ml volumetric flask, add dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 242 nm (Appendix IV A). Calculate the content of $C_{21}H_{30}O_5$, taking 435 as the value of A (1%, 1 cm).

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone Sodium Succinate

$C_{25}H_{32}NaO_8$ 484.52

Hydrocortisone sodium succinate is monosodium 11 β ,17,21-trihydroxypreg-4-ene-3,20-dione-21-succinate. It contains not less than 97.0% and not more than 102.0% of $C_{25}H_{33}NaO_8$, calculated on the dried basis.

Description A white or almost white powder; odourless; hygroscopic. Freely soluble in water, sparingly soluble in ethanol, practically insoluble in chloroform.

Specific optical rotation $+135^\circ$ to $+145^\circ$, in a solution of 10 mg per ml in ethanol (Appendix VI E).

Identification (1) To a quantity of 1% solution, add equal volume of alkaline cupric tartrate TS, a red precipitate is produced immediately by heating.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hydrocortisone sodium succinate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Loss on drying When dried at 105°C for 3 hours, loses not more than 2.0% of its weight (Appendix VIII L).

Sodium content Dissolve about 1.0 g, weigh accurately, in 75 ml of glacial acetic acid by gentle heating, add 20 ml of dioxane, then add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish violet. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 2.299 mg of Na. It contains not less than 4.60% and not more than 4.84% of Na, calculated on the dried basis.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate BS freshly prepared (8 mmol/L potassium dihydrogen phosphate solution, adjust pH value to 5.0 ± 0.1 with 8 mmol/L dipotassium hydrogen phosphate solution) (43 : 57) as the mobile phase. Detection wavelength is 242 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of hydrocortisone sodium succinate. The resolution factor between the peaks of hydrocortisone sodium succinate and the neighbour impurities complies with the related requirements.

Procedure Dissolve a quantity of hydrocortisone sodium succinate in mobile phase to produce a solution of about 40 μg per ml, mix well. Inject 20 μl into the column. Repeat the operation, using hydrocortisone sodium succinate CRS instead of the substance being examined, calculated the content of $C_{25}H_{33}NaO_8$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers and protected from light.

Preparation Hydrocortisone Sodium Succinate for Injection

Hydrocortisone Sodium Succinate for Injection

Hydrocortisone Sodium Succinate for Injection is a sterile lyophilized mixture of hydrocortisone sodium succinate and phosphate buffer. It contains not less than 90.0% and not more than 110.0% of

the labelled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Description A white or almost white lyophilized powder.

Identification (1) To a quantity of 1% solution, add equal volume of alkaline cupric tartrate solution, a red precipitate is produced immediately by heating.

(2) The retention time of principal peak of hydrocortisone sodium succinate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peaks of hydrocortisone sodium succinate CRS in the chromatogram of the reference solution correspondingly.

(3) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Alkalinity A solution of 50 mg per ml in water, pH 7.8-8.0 (Appendix VI H).

Colour of solution Dissolve 0.50 g in 10 ml of water, any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A, method 1).

Free hydrocortisone Calculate the content of free hydrocortisone the amount of free hydrocortisone is not more than 6.7% of labelled amount of hydrocortisone ($C_{21}H_{30}O_5$).

Loss on drying When dried at 105°C for 3 hours, loses not more than 2.0% of its weight (Appendix VIII L).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 50 mg of hydrocortisone per 3 ml in Water for Injections per kg of rabbit's weight.

Undue toxicity Complies with the test for undue toxicity (Appendix XI D), using a solution of 10 mg of hydrocortisone per ml in Water for Injections, injected intravenously.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate BS freshly prepared (8 mmol/L potassium dihydrogen phosphate, adjust pH value to 5.0 ± 0.1 with 8 mmol/L dipotassium hydrogen phosphate) (43 : 57) as the mobile phase. Detection wavelength is 242 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of hydrocortisone sodium succinate. The resolution factor between the peaks of hydrocortisone sodium succinate and hydrocortisone complies with the related requirements.

Procedure Dissolve a quantity of mixed powder obtained in the test for weight variation of contents, weighed accurately, in the mobile phase to produce a solution of about 0.04 mg of hydrocortisone sodium succinate per ml, mix well. Inject 20 μl into the column and record the chromatogram. The substances are eluted in the following order: hydrocortisone sodium 17-succinate, hydrocortisone sodium 21-succinate and free hydrocortisone. Dissolve separately a quantity of hydrocortisone sodium succinate CRS and hydrocortisone CRS, weighed accurately, in the mobile phase to produce two solutions of 0.4 mg per ml and 0.1 mg per ml correspondingly. Measured accurately 5 ml each of above two solutions into the same 50 ml volumetric flask, dilute with the mobile phase to the volume, mix well. Measure in the same manner, calculated the content of hydrocortisone ($C_{21}H_{30}O_5$) with respect to the summary areas of the peaks of hydrocortisone 17-succinate and hydrocortisone 21-succinate obtained in the chromatogram by being multiplied by 0.748.

Category As described under Hydrocortisone Sodium.

Strength Calculated as $C_{21}H_{30}O_5$
(1) 0.05 g (2) 0.1 g

Storage Preserve in tightly closed containers and protected from light.

Hydrocortisone Acetate

$C_{23}H_{32}O_6$ 404.50

[50-03-3]

Hydrocortisone Acetate is 11β , 17α , 21-trihydroxypregn-4-ene-3, 20-dione-21-acetate. It contains not less than 97.0% and not more than 102.0% of $C_{23}H_{32}O_6$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless. Slightly soluble in ethanol or chloroform; insoluble in water.

Melting range 216-224°C, with decomposition (Appendix VI C).

Specific optical rotation $+158^\circ$ to $+165^\circ$, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in dehydrated ethanol at 241 nm (Appendix IV A), the value of A (1%, 1 cm) is 383-407.

Identification (1) Dissolve about 0.1 mg in 1 ml of ethanol, add 8 ml of freshly prepared phenylhydrazine sulfate TS, heat at 70°C for 15 minutes; a yellow colour is produced.

(2) Dissolve about 2 mg in 2 ml of sulfuric acid, a yellow or brownish-yellow colour is produced with green fluorescence.

(3) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hydrocortisone acetate (Appendix XVI).

Related substances Carry out the method as described under Assay. Dissolve about 17 mg of the substance being examined, weighed accurately, in 20 ml of acetonitrile in a 50 ml volumetric flask and sonicate to make hydrocortisone acetate dissolved, dilute with water to volume and mix well as solution (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (2). Inject 20 μ l of solution (2) into the column, adjust the attenuation so that the peak height of hydrocortisone acetate in the chromatogram is about 40% of full scale of the chart. Inject separately accurately 20 μ l each of the solution (1) and (2) into the column and record the chromatogram for 3 times the retention time of the principal peak. The area of any peak other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with solution (2). The sum of the areas of all the peaks other than the principal peak is not greater than twice the area of principal peak

in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and mixture of acetonitrile-water (38 : 62) as the mobile phase. Detection Wavelength is 254 nm. Dissolve proper quantities of hydrocortisone acetate CRS and cortisone acetate CRS, weighed accurately, in mobile phase to produce solution of each 3.5 μ g per ml. The number of the theoretical plates of the column is generally 6000, calculated with reference to the peak of hydrocortisone acetate. The resolution factor between the peaks of hydrocortisone acetate and cortisone acetate is at least 5.5.

Procedure Dissolve a quantity of the substance being examined, weighed accurately, in methanol to produce a solution of 0.22 mg per ml. Measure accurately 2 ml of the solution into a 25 ml volumetric flask, dilute with mobile phase to volume, mix well as the test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Dissolve about 11 mg of hydrocortisone acetate CRS, weighed accurately, in proper quantities of methanol in a 50 ml volumetric flask with the aid of ultrasonic bath, then cool to room temperature, dilute with methanol to volume, mix well. Measure accurately 2 ml of the solution into a 25 ml volumetric flask and dilute with mobile phase to volume, mix well, and repeat the operation using the resulting solution, calculate the content of $C_{23}H_{32}O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Hydrocortisone Acetate Cream
(2) Hydrocortisone Acetate Eye Drops
(3) Hydrocortisone Acetate Eye Ointment
(4) Hydrocortisone Acetate Injection
(5) Hydrocortisone Acetate Tablets

Hydrocortisone Acetate Cream

Hydrocortisone Acetate Cream contains not less than 0.90% and not more than 1.10% of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description Creamy white cream.

Identification To about 6 g of the cream in a beaker add 30 ml of dehydrated ethanol and melt by heating on a water bath, cool in an ice bath, filter and evaporate the filtrate to dryness. The residue complies with tests (1), (2) and (3) for Identification described under Hydrocortisone Acetate.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay To a quantity of the substance being examined, equivalent to about 5 mg of hydrocortisone acetate, weighed accurately, add accurately 50 ml of methanol, stir for 60 \pm 10 seconds at 9500 rpm by homogenizer, filter with two pieces of paper, discard 5 ml of initial filtrate and measure accurately 5 ml of the successive filtrate into a 25 ml volumetric flask, dilute with methanol to volume, mix well as the test solution (1). Carry out the Assay described under Hydrocortisone Acetate, beginning at the words "Inject 20 μ l of the test solution into the column and record

the chromatogram", calculate the content of $C_{23}H_{32}O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Hydrocortisone Acetate.

Strength 10 g : 10 mg

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Hydrocortisone Acetate Eye Drops

Hydrocortisone Acetate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description A suspension of minute granules which deposit on standing, a homogeneous creamy white suspension is obtained on shaking.

Identification Comply with tests (1), (2) and (3) for Identification described under Hydrocortisone Acetate using 12 ml of the substance being examined.

pH value 4.5-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Take several pieces of the substance being examined, and take a sufficient shake, then collect in a stoppered tube, shake again. Measure accurately 2 ml with inner capacity pipet into a 50 ml volumetric flask and add a quantity of methanol, shake to make hydrocortisone acetate dissolved, then dilute with methanol to volume and mix well. Measure accurately 2 ml of the solution into a 25 ml volumetric flask and dilute with mobile phase to volume, mix well as the test solution. Carry out the Assay described under Hydrocortisone Acetate, beginning at the words "Inject 20 μ l of the test solution into the column and record the chromatogram", calculate the content of $C_{23}H_{32}O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Hydrocortisone Acetate.

Strength (1) 3 ml : 15 mg (2) 5 ml : 25 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone Acetate Eye Ointment

Hydrocortisone Acetate Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description A yellow ointment.

Identification Place about 12 g of the ointment in a stoppered conical flask, add 20 ml of petroleum ether, shake thoroughly until the ointment base is dissolved. Filter, wash the residue with several portions of petroleum ether, then add 10 ml of dehydrated ethanol, heat on a water bath to dissolve the hydrocortisone acetate by stirring. Cool in an ice bath and filter again, evaporate the filtrate on a water bath to dryness. The residue complies with tests (1) and (2) for Identification described under Hydrocortisone Acetate.

Other requirements Complies with the general requirements for eye preparations (Appendix I G).

Assay Reference preparation Dissolve 20 mg of hydrocortisone acetate CRS, accurately weighed, in a 100 ml volumetric flask in dehydrated ethanol with shaking, dilute to volume and mix well.

Test preparation To a quantity of the ointment equivalent to 20 mg of hydrocortisone acetate, accurately weighed, in a beaker add 30 ml of dehydrated ethanol. Heat on a water bath to dissolve hydrocortisone acetate, cool in an ice water and filter into a 100 ml volumetric flask. Repeat the extraction for 3 times, combine all the filtrates in the same volumetric flask, dilute with dehydrated ethanol to volume and mix well.

Procedure Transfer 1 ml each of the two preparations, accurately measured, into separate stoppered test tubes, to each tube add exactly 9 ml of dehydrated ethanol and 1 ml of triphenyltetrazolium chloride TS, mix well, add exactly 1 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark at 25°C for 40-45 minutes and measure the absorbances of the resulting solutions at 485 nm (Appendix IV A). Calculate the content of $C_{23}H_{32}O_6$.

Category As described under Hydrocortisone Acetate.

Strength 0.5%

Storage Preserve in tightly closed containers, stored in a cool place.

Hydrocortisone Acetate Injection

Hydrocortisone Acetate Injection is a sterile suspension of Hydrocortisone Acetate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description A suspension of minute granules which deposit on standing, a homogeneous creamy white suspension is obtained on shaking.

Identification Shake 3 ml of the injection with two 10 ml portions of chloroform, and filter, evaporate the combined filtrate to dryness on a water bath. The residue complies with tests (1), (2) and (3) for Identification described under Hydrocortisone Acetate.

pH value 5.0-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Take several pieces of the substance being examined, and take a sufficient shake, then collect in a cube with plug, shake again. Measure accurately 2 ml with inner capacity pipet into a 200 ml volumetric flask and add proper quantities of methanol, shake to make hydrocortisone acetate dissolved, then dilute with methanol to volume and mix well. Measure accurately 2 ml of the solution into a 25 ml volumetric flask and dilute with mobile phase to volume, mix well as the test solution. Carry out the Assay described under Hydrocortisone Acetate, beginning at the words "Inject 20 μ l of the test solution into the column and record the chromatogram", calculate the content of $C_{23}H_{32}O_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Hydrocortisone Acetate.

Strength (1) 1 ml : 25 mg (2) 5 ml : 125 mg

Storage Preserve in tightly closed containers, protected from light.

Hydrocortisone Acetate Tablets

Hydrocortisone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Description White tablets.

Identification Powder a quantity of tablets equivalent to 0.06 g of hydrocortisone acetate, extract with two portions of 10 ml each of chloroform, combine the chloroform solutions, filter and evaporate to dryness on a water bath. The residue complies with the tests (1) and (2) for Identification described under Hydrocortisone Acetate.

Content uniformity Comply with the requirement (Appendix X E). Triturate 1 tablet with absolute ethanol and transfer completely into a 200 ml volumetric flask, dilute with absolute ethanol to volume, shake thoroughly and filter, and use successive filtrate as the test solution. Dissolve 20 mg of hydrocortisone acetate CRS in a 200 ml volumetric flask in absolute ethanol, dilute with absolute ethanol to volume, shake thoroughly, used as the reference solution. Carry out the method described in Assay, beginning at the word "To 1 ml each of two preparations...", calculate the content of $C_{23}H_{32}O_6$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity, equivalent to about 20 mg of hydrocortisone acetate in a 200 ml volumetric flask add absolute ethanol and shake thoroughly, dilute with absolute ethanol to volume, and filter, using the successive filtrate as the test solution. Dissolve 20 mg of hydrocortisone acetate CRS, accurately weighed, in absolute ethanol into a 200 ml volumetric flask, dilute to volume and shake well, as the reference solution.

Procedure To 1 ml each of two solutions, accurately measured, in separate stoppered test tubes add accurately 9 ml of absolute ethanol and 1 ml of triphenyltetrazolium chloride TS and mix well; then add accurately 1 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark at 25°C for 40-45 minutes and measure the absorbance at 485 nm (Appendix IV A). Calculate the content of $C_{23}H_{32}O_6$.

Category As described under Hydrocortisone Acetate.

Strength 20 mg

Storage Preserve in tightly closed containers; protected from light.

Hydrocortisone Butyrate

$C_{25}H_{36}O_6$ 432.56

Hydrocortisone Butyrate is 11 β , 21-dihydroxy-17-

(1-oxotutoxy)-pregn-4-ene-3,20-dione. It contains not less than 97.0% and not more than 102.0% of $C_{25}H_{36}O_6$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Very soluble in chloroform; soluble in methanol; slightly soluble in absolute ethanol; very slightly soluble in ether; practically insoluble in water.

Melting range 197-208°C, with decomposition (Appendix VI C).

Specific optical rotation +47° to +54°, in a solution of about 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve 4 mg in 2 ml of sulfuric acid, a yellow to brownish-yellow colour with green fluorescence is produced.

(2) Dissolve 10 mg in 1 ml of methanol, add 1 ml of an alkaline cupric tartrate TS and heat, a red precipitate of cuprous oxide is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Hydrocortisone Butyrate (Appendix XVI).

Related substances Weigh accurately 15 mg of the substance being examined to 50 ml volumetric flask, add 20 ml of acetonitrile to dissolve, dilute with water to volume as test solution. Measure accurately 1 ml, dilute with mobile phase to a 50 ml volumetric flask as the reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of full scale of the chart. Inject separately 20 μ l each of solutions into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with reference solution, each peak area other than the principal peak are not greater than 1/2 area of the principal peak in the chromatogram obtained with reference solution.

Loss on drying When dried to constant weight at 75°C in vacuum, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-acetonitrile-glacial acetic acid (55 : 45 : 0.5) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of hydrocortisone butyrate. The resolution factor between the peaks of hydrocortisone butyrate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of methyltestosterone, accurately weighed, in methanol to produce a solution of 0.18 mg per ml.

Procedure Dissolve a quantity of hydrocortisone butyrate CRS, accurately weighed, in methanol to produce a solution of 0.26 mg per ml as the reference solution. Transfer 5 ml each of the reference solution and the internal standard solution, both measured accurately, in a 50 ml volumetric

flask, dilute with methanol to volume, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using the substance being examined instead of hydrocortisone butyrate CRS, calculate the content of $C_{25}H_{36}O_6$.

Category Corticosteroid

Storage Preserve in tightly closed containers, protected from light.

Preparation Hydrocortisone Butyrate Cream

Hydrocortisone Butyrate Cream

Hydrocortisone Butyrate Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of Hydrocortisone Butyrate ($C_{25}H_{36}O_6$).

Description A white cream.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of hydrocortisone butyrate CRS.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-acetonitrile-glacial acetic acid (55 : 45 : 0.5) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of hydrocortisone butyrate. The resolution factor between the peaks of hydrocortisone butyrate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of methyltestosterone, accurately weighed, in methanol to produce a solution of 0.18 mg per ml.

Procedure Dissolve a quantity of hydrocortisone butyrate CRS, accurately weighed, in methanol to produce a solution of 0.26 mg per ml as reference solution. Transfer 5 ml each of the reference solution and the internal standard solution, measured accurately, in a 50 ml volumetric flask, dilute with methanol to volume, mix well. Inject 20 μ l of the resulting solution into the column. Transfer an accurately weighed quantity of the ointment equivalent to about 1.3 mg of hydrocortisone butyrate to a 50 ml beaker, add 15 ml of methanol, stir to dissolve hydrocortisone butyrate on a water bath at 50°C, allow to cool to room temperature. Transfer to a 50 ml volumetric flask, add 5 ml of internal standard solution, dilute with methanol to volume, shake well, allow to cool in ice bath for 2 hours and filter. Inject 20 μ l of the filtrate into the column, calculate the content of $C_{25}H_{36}O_6$.

Category As described under Hydrocortisone Butyrate.

Strength 10 g : 10 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Strong Hydrogen Peroxide Solution

H_2O_2 34.01

Strong Hydrogen Peroxide Solution contains 26.0%-28.0% (g/g) of hydrogen peroxide (H_2O_2).

Description A clear, colourless liquid; odourless or with an odour characteristic of ozone; decomposes rapidly in contact with oxidizing or reducing agent with effervescence; deteriorates on exposure to light.

Identification (1) To 0.1 ml add 10 ml of water, 1 drop of dilute sulfuric acid, 2 ml of ether and a few drops of potassium dichromate TS, a blue colour is produced in ether layer on shaking.

(2) Make alkaline a quantity with sodium hydroxide TS and heat, it decomposes with effervescence and liberates oxygen.

Acidity Dilute 5 ml with water to 50 ml, add a few drops of phenolphthalein IS and 0.5 ml of sodium hydroxide (0.1 mol/L) VS, a pale red colour is produced.

Barium To 10 ml add 2 drops of dilute sulfuric acid, no opalescence is produced within 10 minutes.

Nonvolatile matter Evaporate 10 ml to dryness on a water bath and dry to constant weight at 105°C, the residue is not more than 15 mg.

Assay Measure accurately 2 ml to a 200 ml volumetric flask, dilute with water to volume and shake well. To 10 ml, accurately measured, in a flask add 20 ml of dilute sulfuric acid and titrate with potassium permanganate (0.02 mol/L) VS. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 1.701 mg of H_2O_2 .

Category Antiseptic and disinfectant

Storage Preserve in tightly closed containers, protected from light, stored in a cool place.

Preparation Hydrogen Peroxide Solution

Hydrogen Peroxide Solution

Hydrogen Peroxide Solution contains not less than 2.5% and not more than 3.5% of H_2O_2 .

Description A clear, colourless liquid; odourless or with an odour characteristic of ozone; rapidly decomposes with effervescence when in contact with oxidizing or reducing substances; deteriorates on exposure to light.

Relative density 1.01, at 25°C (Appendix VI A).

Identification (1) To 1 ml add 10 ml of water, 1 drop of dilute sulfuric acid, 2 ml of ether, and a few drops of potassium dichromate TS and shake; a blue colour is produced in the ether layer.

(2) Decomposes with effervescence, when made alkaline with sodium hydroxide TS and heated, oxygen is evolved.

Acidity To 5 ml add a few drops of phenolphthalein IS and 0.5 ml of sodium hydroxide (0.1 mol/L) VS, a pale red colour is produced.

Barium To 10 ml add 2 drops of dilute sulfuric acid, no opalescence is produced within 10 minutes.

Nonvolatile matter Evaporate 10 ml to dryness on a water bath, dry at 105°C to constant weight, the residue is not more than 15 mg.

Assay Measure accurately 5 ml into a 50 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 10 ml to a conical flask, add 20 ml of dilute sulfuric acid, titrate with potassium permanganate (0.02 mol/L) VS. Each ml of potassium permanganate (0.02 mol/L) VS is equivalent to 1.701 mg of H_2O_2 .

Category As described under Strong Hydrogen peroxide solution.

Storage Preserve in well closed containers, stored in cool place and protected from light.

Hydroxycarbamide

$\text{CH}_4\text{N}_2\text{O}_2$ 76.06

[127-07-1]

Hydroxycarbamide contains not less than 98.5% of $\text{CH}_4\text{N}_2\text{O}_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly astringent.

Freely soluble in water; slightly soluble in ethanol; insoluble in ether.

Melting range 138-145°C, with decomposition (Appendix VI C).

Identification (1) Heat gently about 0.5 g with 3 ml of sulfuric acid, it effervesces with the evolution of carbon dioxide.

(2) Boil about 0.5 g with 5 ml of sodium hydroxide TS, the characteristic odour of ammonia is perceived.

(3) Dissolve about 0.5 g in 5 ml of water, add 1 ml of alkaline cupric tartrate TS, boil for 1-2 minutes, a red precipitate of cuprous oxide is produced.

(4) Dissolve about 0.1 g in 5 ml of water, add 1 drop of ferric chloride TS, a bluish violet colour is produced.

(5) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hydroxycarbamide (Appendix XVI).

Clarity of solution A solution of 0.50 g in 10 ml of water is clear.

Chloride Dissolve 0.20 g in 20 ml of water. Carry out the limit test for chloride (Appendix VIII A), using 10 ml of the solution. Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.05%).

Urea and related substances Dissolve 0.10 g in water in a 10 ml volumetric flask, dilute to volume and mix well as the test solution. Dissolve 0.01 g of urea in water in a 100 ml volumetric flask, dilute to volume and mix well as the reference solution. Treat a chromatographic filter paper strip by immersing it in phosphate BS (pH 6.5) (mix 700 ml of 0.02 mol/L disodium hydrogen phosphate solution and 300 ml of 0.1 mol/L citric acid solution). After removal of the paper strip, dry in air. Carry out the method for descending paper chromatography (Appendix V A). Apply to the chromatographic paper strip previously treated as described above 10 μl of the test solution and 50 μl of the reference solution. Place the lower layer of a mixture of isobutanol and water (1:1) in the bottom of the developing chamber, and the upper layer is used as mobile phase. Develop for 24 hours. After developing and removal of the strip, dry in air, and develop for another 24 hours. After removal of the strip, dry in air, spray with phosphomolybdic acid solution (shake to dissolve 1.0 g of *p*-dimethylaminobenzaldehyde in a mixture of 50 ml of ethanol and 2 ml of hydrochloric acid in a 100 ml volumetric flask, dilute with ethanol to volume and mix well), heat for 1-2 minutes at 90°C. Any spots, other than the principal spot,

obtained with the test solution is not more intense than the principal spot obtained with the reference solution, and the number of the secondary spot is not more than 2.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 50 ml of water, add 10 ml of hydrochloric acid solution (1→3). Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 7.606 mg of $\text{CH}_4\text{N}_2\text{O}_2$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Hydroxycarbamide Tablets

Hydroxycarbamide Tablets

Hydroxycarbamide Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of hydroxycarbamide ($\text{CH}_4\text{N}_2\text{O}_2$).

Description White tablets

Identification Comply with tests (1), (2), (3) and (4) for Identification described under Hydroxycarbamide, using a quantity of the powdered tablets.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity, accurately weighed, of the powdered tablets equivalent to about 0.15 g of hydroxycarbamide add 50 ml of water, stir well, proceed as described under Hydroxycarbamide beginning at the words "add 10 ml of hydrochloric acid solution (1→3)..." Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 7.606 mg of $\text{CH}_4\text{N}_2\text{O}_2$.

Category As described under Hydroxycarbamide.

Strength 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Hydroxyprogesterone Caproate

$\text{C}_{27}\text{H}_{46}\text{O}_4$ 428.62

[630-56-8]

Hydroxyprogesterone Caproate is the caproic ester of 17 α -hydroxypregn-4-ene-3,20-dione. It contains

not less than 97.0% and not more than 103.0% of $C_{27}H_{40}O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, tasteless.

Freely soluble in ethanol, acetone or ether; sparingly soluble in camellia oil or castor oil; insoluble in water.

Melting range 120-124°C (Appendix VI C).

Specific optical rotation +58° to +64°, in a solution of about 10 mg per ml in chloroform (Appendix VI E).

Identification (1) To about 1 mg add 1 ml of sulfuric acid, allow to stand for 2 minutes, a slightly yellow colour is produced; add 0.5 ml of water, the colour changes from green to red and finally to reddish-violet with blue fluorescence.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of hydroxyprogesterone caproate CRS.

(3) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of hydroxyprogesterone caproate (Appendix XVI).

Acidity Dissolve 0.20 g in 25 ml of dehydrated ethanol neutral to bromothymol blue, promptly add several drops of bromothymol blue IS and titrate with sodium hydroxide (0.02 mol/L) VS to a slight blue colour; not more than 0.50 ml of sodium hydroxide VS is required.

Related substances Carry out the method described under Assay. Dissolve a quantity of the substance being examined, with methanol to produce a solution of about 1 mg per ml as solution (1). Measure accurately proper quantities of solution (1) and dilute with methanol to produce a solution of 16 µg per ml as solution (2). Inject 5 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about full scale of the chart. Inject separately accurately 5 µl each of the solution (1) and (2) into the column and record the chromatogram for twice the retention time of the principal peak. No more than four secondary peaks in the chromatogram obtained with solution (1), each secondary peak and the sum of the areas of all secondary peaks are not greater than 1/2 and 3/4 of the area of the principal peak of solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85 : 15) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak area of hydroxyprogesterone caproate. The resolution factor between the peaks of hydroxyprogesterone caproate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of norethisterone, accurately weighed, in methanol to produce a solution of 1 mg per ml.

Procedure Dissolve a quantity of hydroxyprogesterone caproate CRS, accurately weighed, in methanol to produce a solution of 1 mg per ml as the reference solution. Transfer 2 ml each of the reference solution and the internal standard solution, both measured accurately, into a 10 ml volumetric flask, dilute with methanol to volume, mix well, inject 5 µl of the resulting solution into the column. Repeat the operation, using a quantity of the substance being examined instead of hydroxyprogesterone caproate CRS, calculate the content of $C_{27}H_{40}O_4$.

Category Progestoid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Hydroxyprogesterone Caproate Injection
(2) Compound Hydroxyprogesterone Caproate Injection

Hydroxyprogesterone Caproate Injection

Hydroxyprogesterone Caproate Injection is a sterile solution of Hydroxyprogesterone Caproate in oil. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Hydroxyprogesterone Caproate ($C_{27}H_{40}O_4$).

Description A slight yellow to yellow clear oily liquid.

Identification Dilute a quantity of the injection with chloroform to produce a solution containing 1.0 mg per ml of hydroxyprogesterone caproate (solution 1), dissolve a quantity of hydroxyprogesterone caproate CRS in chloroform to produce a solution of 1.0 mg per ml (solution 2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of cyclohexane-ethyl acetate (1 : 1) as the mobile phase. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry in air and examine under an ultraviolet light (254 nm). The principal spots in the chromatogram obtained with the two solutions are identical in position.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85 : 15) as the mobile phase. Detection wavelength is 254 nm. Dissolve proper quantities of hydroxyprogesterone caproate and estradiol valerate CRS, weighed accurately, in methanol to produce a solution of each 20 µg per ml. The resolution factor between the peaks of hydroxyprogesterone caproate and estradiol valerate should comply with the related requirements.

Procedure Measure accurately a quantity of the substance being examined by inner capacity pipet, in methanol to produce a solution of 20 µg per ml as solution (1). Inject 10 µl of solution (1) into the column and record the chromatogram. Dissolve a quantity of hydroxyprogesterone caproate CRS, weighed accurately, with methanol to produce a solution of about 20 µg per ml, repeat the operation, calculate the content of $C_{27}H_{40}O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Hydroxyprogesterone Caproate.

Strength (1) 1 ml : 0.125 g (2) 2 ml : 0.25 g
(3) 1 ml : 0.25 g

Storage Preserve in well closed containers, protected from light.

Compound Hydroxyprogesterone Caproate Injection

Compound Hydroxyprogesterone Caproate Injection is a sterile solution of hydroxyprogesterone caproate and estradiol valerate in oil. It contains not less

than 90.0% and not more than 110.0% of the labelled amount of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$).

Description Pale yellow or yellow clear oily liquid.

Identification Dilute a quantity with absolute ethanol to produce a solution containing 0.1 mg of estradiol valerate and 5 mg of hydroxyprogesterone caproate per ml as the test solution. Prepare the reference solution of 0.1 mg per ml of estradiol valerate CRS and 5 mg per ml of hydroxyprogesterone caproate CRS. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of cyclohexane-ethyl acetate-triethanolamine (50 : 50 : 0.5) as the mobile phase. Apply separately to the same plate 20 μ l each of above solutions, after developing and removal of the plate, dry it in air, spray with sulfuric acid-ethanol (1 : 1), heat at 110°C for 5-10 minutes. The colour and position of the two principal spots in the chromatogram obtained with the test solution correspond to the principal spots obtained with the reference solutions.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85 : 15) as the mobile phase with flow rate of 0.7 ml per minute and detection wavelength is 225 nm. The resolution factor between the peaks of hydroxyprogesterone caproate and estradiol valerate should comply with the related requirements.

Procedure Measure accurately 1 ml of the injection into a 25 ml volumetric flask with an inner capacity pipet. Dissolve in methanol and dilute to volume, mix well; measure accurately 1 ml to a 10 ml volumetric flask, and dilute with methanol to volume, as the test solution of estradiol valerate; measure accurately 1 ml into a 50 ml volumetric flask, dilute with methanol to volume, mix well as the test solution of hydroxyprogesterone caproate. Inject separately 10 μ l each of the two test solutions, accurately measured, into the column, record the chromatogram and measure the peak areas. Dissolve separately a quantity of estradiol valerate CRS and hydroxyprogesterone caproate CRS in methanol to produce two solutions each of 0.02 mg per ml, as reference solutions, repeat the operation, inject separately 10 μ l each of the two reference solutions accurately measured, calculate the contents of $C_{27}H_{40}O_4$ and $C_{23}H_{32}O_3$ respectively with respect to the peak area obtained in chromatogram by the external standard method.

Category Contraceptive.

Strength 1 ml : 250 mg of hydroxyprogesterone caproate and 5 mg of estradiol valerate

Storage Preserve in well closed containers, protected from light.

Hymecromone

$C_{10}H_8O_3$ 176.17

[90-33-5]

Hymecromone is 7-hydroxy-4-methyl-2H-1-benzopyran-2-one. It contains not less than 98.0% and not more than 102.0% of $C_{10}H_8O_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Sparingly soluble in methanol, ethanol or acetone; insoluble in water; freely soluble in sodium hydroxide solution.

Melting range 188-192°C (Appendix VI C).

Identification (1) Dissolve a quantity in 2 ml of ethanol, examine under diffused sun light, a pale violet fluorescence is produced; add 2 drops of sodium hydroxide TS, a blue fluorescence is produced; the fluorescence disappears on adding 2-3 drops of dilute hydrochloric acid. An intense yellowish-green fluorescence is produced under ultraviolet light.

(2) The light absorption of a solution of 5 μ g per ml in ethanol exhibits a maximum at 323 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of hymecromone (Appendix XVI).

Acidity Shake 1.0 g with 50 ml of water for 10 minutes and filter, the pH value of the filtrate is 6.0-7.0 (Appendix VI H).

Sulfate Shake 1.0 g with 40 ml of water for 5 minutes and filter. Carry out the limit test for sulfate (Appendix VIII B), using 20 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.040%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Protect from light throughout the procedure. Shake thoroughly about 0.1 g, accurately weighed, in a 100 ml amber coloured volumetric flask, with 10 ml of 0.1 mol/L sodium hydroxide solution, accurately measured, dilute with water to volume and mix well. Transfer 5 ml of the solution, accurately measured, to a 50 ml amber coloured volumetric flask, dilute with 0.002 mol/L sodium hydroxide solution to volume and mix well. Transfer 5 ml of this solution, accurately measured, to a 100 ml amber coloured volumetric flask, dilute with 0.002 mol/L sodium hydroxide solution to volume and mix well. Measure the absorbance of the resulting solution at 360 nm (Appendix IV A). Repeat the operation, using about 0.1 g of hymecromone CRS instead of the substance being examined. Calculate the content of $C_{10}H_8O_3$.

Category Cholagogic.

Storage Preserve in tightly closed containers, stored in a cool and dry place, protected from light.

Preparation (1) Hymecromone Capsules
(2) Hymecromone Tablets

Hymecromone Capsules

Hymecromone capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of hymecromone ($C_{10}H_8O_3$).

Description Hard capsules containing white or almost white powders.

Identification The contents comply with test (1) for Identification described under Hymecromone.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 0.1 g of hymecromone. Carry out the Assay described under Hymecromone Tablets, beginning at the words "in a 100 ml amber coloured volumetric flask with 10 ml of 0.1 mol/L sodium hydroxide solution, accurately measured...", calculate the content of $C_{10}H_8O_3$.

Category As described under Hymecromone.

Strength (1) 0.2 g (2) 0.4 g

Storage Preserve in tightly closed containers, stored in a cool place, protected from light.

Hymecromone Tablets

Hymecromone Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of hymecromone ($C_{10}H_8O_3$).

Description White or almost white tablets.

Identification To a quantity of powdered tablets equivalent to about 30 mg of hymecromone add 10 ml of ethanol, shake to dissolve hymecromone, filter, the filtrate complies with test (1) for Identification described under Hymecromone.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder 10 tablets. Shake an accurately weighed quantity of the powder equivalent to about 0.1 g of hymecromone in a 100 ml amber coloured volumetric flask with 10 ml of 0.1 mol/L sodium hydroxide solution, dilute with water to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml amber coloured volumetric flask, dilute with 0.002 mol/L sodium hydroxide solution to volume, mix well. Transfer 5 ml of this solution, accurately measured, to a 100 ml amber coloured volumetric flask, dilute with 0.002 mol/L sodium hydroxide solution to volume and mix well. Measure the absorbance of the resulting solution at 360 nm (Appendix IV A), calculate the content of $C_{10}H_8O_3$, taking 1085 as the value of A (1%, 1 cm).

Category As described under Hymecromone.

Strength 0.2 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Ibuprofen

$C_{13}H_{18}O_2$ 206.28

[15687-27-1]

Ibuprofen is α -methyl-4-(2-methylpropyl) benzeneacetic acid. It contains not less than 98.5% of $C_{13}H_{18}O_2$, calculated on the dried basis.

Description A white crystalline powder; odour, slightly characteristic; almost tasteless.

Freely soluble in ethanol, acetone, chloroform or ether; practically insoluble in water; freely soluble in sodium hydroxide TS or sodium carbonate TS.

Melting point 74.5-77.5°C (Appendix VI C).

Identification (1) The light absorption of a solution of 0.25 mg per ml in 0.4% sodium hydroxide solution exhibits maxima at 265 nm and 273 nm; minima at 245 nm and 271 nm, and a shoulder at 259 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of ibuprofen (Appendix XVI).

Chloride To 1.0 g add 50 ml of water, shake for 5 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the successive titrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.010%).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-hexane-ethyl acetate-glacial acetic acid (15 : 5 : 1) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in chloroform containing (1) 100 mg per ml, (2) 1.0 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and spray with 1% potassium permanganate solution in dilute sulfuric acid, heat at 120°C for 20 minutes and examine under ultraviolet light (365 nm). No spot other than the principal spot in the chromatogram, obtained with solution (1) is more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 22 ml of ethanol, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 50 ml of neutral ethanol (neutral to phenolphthalein IS), add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 20.63 mg of $C_{13}H_{18}O_2$.

Category Antipyretic and analgesic, non-steroids anti-inflammatory.

Storage Preserve in tightly closed containers.

- Preparation** (1) Ibuprofen Capsules
 (2) Ibuprofen Drops
 (3) Ibuprofen Oral Solution
 (4) Ibuprofen Sustained-release Capsules
 (5) Ibuprofen Syrup
 (6) Ibuprofen Tablets

Ibuprofen Capsules

Ibuprofen Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of Ibuprofen ($C_{13}H_{18}O_2$).

Description Capsules containing white crystalline powder or powder.

Identification Dissolve a quantity of the contents in 0.4% sodium hydroxide solution to produce a solution of about 0.25 mg per ml and filter, the successive filtrate complies with the test (1) for Identification described under Ibuprofen.

Dissolution Carry out the dissolution test (Appendix X C, Method 1), using 900 ml of phosphate BS (pH 7.2) as the dissolution medium, adjust the rotational speed of the basket to 120 rpm. Withdraw 5 ml of the solution after exactly 30 minutes and filter, accurately transfer 1 ml of the successive filtrate in a 25 ml volumetric flask, dilute with dissolution medium to volume, mix well and measure the absorbance at 222 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_{18}O_2$ from each capsule, taking 449 as the value of A (1%, 1 cm), not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 0.5 g of ibuprofen, add 20 ml of neutral ethanol (neutral to phenolphthalein IS), shake to dissolve ibuprofen, add 5 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 20.63 mg of $C_{13}H_{18}O_2$.

Category As described under Ibuprofen.

Strength 0.2 g

Storage Preserve in tightly closed containers.

Ibuprofen Drops

Ibuprofen Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of Ibuprofen ($C_{13}H_{18}O_2$).

Description A pink suspension; taste, sweet.

Identification (1) Dissolve a quantity in 0.4% sodium hydroxide solution to produce a solution of about 0.25 mg per ml (Filter if necessary). The light absorption of the solution exhibits maxima at 265 nm and 273 nm (Appendix IV A). (2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ibuprofen CRS.

pH value 3.5-4.5 (Appendix VI H).

Relative density 1.10-1.15 (Appendix VI A).

Other requirements Comply with the general requirements

for Oral Suspensions (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium acetate BS (dissolve 6.13 g of sodium acetate in 750 ml of water, by shaking, adjust to pH 2.5 with glacial acetic acid)-acetonitrile (40 : 60) as the mobile phase. Detection wavelength is 263 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of ibuprofen.

Procedure Transfer accurately 2 ml with a "to contain" pipette in a 100 ml volumetric flask, wash the interior of the pipette with 80 ml of a mixture of methanol-water (50 : 50), transfer the washings to the same volumetric flask, shake for 30 minutes, dilute with a mixture of methanol-water (50 : 50) to volume, mix well. Filter and accurately inject 20 μ l of the successive filtrate into the column, record the chromatogram. Repeat the operation, using ibuprofen CRS instead of the substance being examined. Calculate the content of $C_{13}H_{18}O_2$.

Category As described under Ibuprofen.

Strength 20 ml : 0.8 g

Storage Preserve in tightly closed containers, stored in a cool place.

Ibuprofen Oral Solution

Ibuprofen Oral Solution contains not less than 93.0% and not more than 107.0% of the labelled amount of ibuprofen ($C_{13}H_{18}O_2$).

Description A pale yellow to yellow solution.

Identification (1) Adjust about 20 ml to pH 2.0 with 1 mol/L hydrochloride acid solution, filter, wash the residue with a little water and dry. Dissolve a quantity of the residue in 0.4% sodium hydroxide solution to produce a solution of about 0.25 mg per ml. The light absorption of the solution exhibits maxima at 265 nm and 273 nm, minima at 245 nm and 271 nm, and a shoulder at 259 nm (Appendix IV A). (2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of ibuprofen CRS.

pH value 7.0-9.0 (Appendix VI H).

Other requirements Comply with the general requirements for Oral Solution (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium acetate BS (dissolve 6.13 g of sodium acetate in 750 ml of water, by shaking, adjust to pH 2.5 with glacial acetic acid)-acetonitrile (40 : 60) as the mobile phase. Detection wavelength is 263 nm and the number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of ibuprofen.

Procedure Transfer accurately a quantity with a "to contain" pipette, dilute with methanol to produce a solution of 0.5 mg per ml. Accurately inject 20 μ l into the column, record the chromatogram. Repeat the operation, using ibuprofen CRS instead of the substance being examined. Calculate the content of $C_{13}H_{18}O_2$ with respect to the peak area obtained in chromatogram by the external standard method.

Category As described under Ibuprofen.

Strength (1) 10 ml : 0.1 g

Storage Preserve in tightly closed containers, stored in a cool place.

Ibuprofen Sustained-release Capsules

Ibuprofen Sustained-release Capsules contains not less than 93.0% and not more than 107.0% of the labelled amount of ibuprofen ($C_{13}H_{18}O_2$).

Description The contents of white spherical small pills.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ibuprofen CRS.

Drug Release Carry out the drug release test (Appendix X D, method 1), with the apparatus of dissolution test method 1, using 900 ml of phosphate BS (to 68.05 g of potassium dihydrogen phosphate add 56 ml of 1 mol/L sodium hydroxide solution, dilute with water to 10000 ml, mix well, pH 6.0 ± 0.05) as the release medium, adjust the rotational speed of the basket to 30 rpm. Withdraw 5 ml of the solution at 1, 2, 4 and 7 hours respectively, and add immediately 5 ml of the same release medium to the vessel to compensate the volume. Filter, inject 20 μ l of the successive filtrate into the column, as described in the Assay. Dissolve a quantity of ibuprofen CRS, accurately weighed, in phosphate BS to produce a solution of 300 μ g per ml, repeat the operation. Calculate the amount of ibuprofen dissolved at different time for each capsule. The amount of ibuprofen dissolved in 1, 2, 4 and 7 hours is 10%-35%, 25%-55%, 50%-80% and not less than 75% of the labelled amount, respectively.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. The mobile phase is a mixture of sodium acetate BS (dissolve 6.13 g of sodium acetate in 750 ml of water, by shaking, adjust with glacial acetic acid to pH 2.5)-acetonitrile (40 : 60). The wavelength of the detector is 263 nm. The number of theoretical plates of the column is not less than 1100, calculated with reference to the peak area of ibuprofen.

Procedure Weigh accurately a quantity of the mixed contents obtained in the weight variation of contents of the capsules, equivalent to about 0.1 g of ibuprofen, in a 200 ml volumetric flask, add 100 ml of methanol, shake for 30 minutes, dilute with water to volume, mix well and filter. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Repeat the operation, using ibuprofen CRS instead of the substance being examined. Calculate the content of $C_{13}H_{18}O_2$ with respect to the peak area obtained in chromatogram by the external standard method.

Category As described under Ibuprofen.

Strength 0.3 g

Storage Preserve in tightly closed containers.

Ibuprofen Syrup

Ibuprofen Syrup contains not less than 93.0% and not more than 107.0% of the labelled amount of ibuprofen ($C_{13}H_{18}O_2$).

Description A clear, pale yellow-brown viscous liquid; odour, fragrant.

Identification (1) Adjust about 20 ml to pH 2.0 with 1 mol/L hydrochloric acid solution, filter, wash the residue with a little water and dry. Dissolve a quantity of the residue in 0.4% sodium hydroxide solution to produce a solution of about 0.25 mg per ml. The light absorption of the solution exhibits maxima at 265 nm and 273 nm, minima at 245 nm and 271 nm, and a shoulder at 259 nm (Appendix IV A). (2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ibuprofen CRS.

Relative density not less than 1.200 (Appendix VI A).

pH value 7.0-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for syrups (Appendix I K).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetate BS (dissolve 6.13 g of sodium acetate in 750 ml of water, by shaking, adjust to pH 2.5 with glacial acetic acid)-acetonitrile (40 : 60) as the mobile phase. Detection wavelength is 263 nm and the number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of ibuprofen.

Procedure Transfer accurately a quantity with a "to contain" pipette, dilute with methanol to produce a solution of 0.5 mg per ml. Accurately inject 20 μ l into the column, record the chromatogram. Repeat the operation, using ibuprofen CRS instead of the substance being examined. Calculate the content of $C_{13}H_{18}O_2$ with respect to the peak area obtained in chromatogram by the external standard method.

Category As described under Ibuprofen.

Strength (1) 10 ml : 0.2 g (2) 90 ml : 1.8 g

Storage Preserve in tightly closed containers, protected from light.

Ibuprofen Tablets

Ibuprofen Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of ibuprofen ($C_{13}H_{18}O_2$).

Description Sugar coated or film coated tablets with white core.

Identification (1) The light absorption of a solution of 0.25 mg per ml in 0.4% sodium hydroxide solution exhibits maxima at 265 nm and 273 nm, minima at 245 nm and 271 nm, and a shoulder at 259 nm (Appendix IV A).

(2) Dissolve 5 powdered tablets of ibuprofen in 20 ml of acetone, filter. After evaporating the filtrate in air, dry it in vacuum. The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of ibuprofen (Appendix XVI).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 7.2) as the dissolution medium, adjust the rotational speed of the basket to 120 rpm. Withdraw 5 ml of the solution after exactly 30 minutes and filter, measure accurately 2 ml of the successive filtrate, dilute to 25 ml with the dissolution medium, mix well and measure the absorbance at 222 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_{18}O_2$ from each tablet,

taking 449 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with the coating removed. To an accurately weighed quantity, equivalent to about 0.5 g of ibuprofen add 20 ml of neutral ethanol (neutral to phenolphthalein IS) and shake to dissolve ibuprofen. Filter through a sintered glass filter, wash the container and filter with four portions of 10 ml each of neutral ethanol, combine the washings and filtrate, add 5 drops of phenolphthalein IS, and titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 20.63 mg of $C_{13}H_{18}O_2$.

Category As described under Ibuprofen.

Strength (1) 0.1 g (2) 0.2 g

storage Preserve in tightly closed containers.

Ibuprofen and Pseudoephedrine Hydrochloride Tablets

Ibuprofen and Pseudoephedrine hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of ibuprofen ($C_{13}H_{18}O_2$), and not less than 90.0% and not more than 110.0% of the labelled amount of pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

Formula	Ibuprofen	200 g
	Pseudoephedrine hydrochloride	30 g
	pharmaceutical aid	sufficient quantity
	To make	1000 tablets

Description White tablets or film coated tablets with white or almost white core.

Identification (1) The retention time of the two principle peaks of the substance being examined in the chromatogram obtained in the Assay are identical with that of the principle peaks of ibuprofen CRS and pseudoephedrine hydrochloride CRS.

(2) Shake a quantity of powdered tablets with water, filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, Method 1), using 900 ml of phosphate BS (pH 7.2) as the dissolution medium, adjust the rotational speed of the basket to 120 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, use the successive filtrate as the test solution. Carry out the procedure as described under the Assay, calculate the dissolution of $C_{13}H_{18}O_2$ and $C_{10}H_{15}NO \cdot HCl$ from each tablet respectively, not less than 80% of the labelled amount is dissolved respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (dissolve 0.68 g of sodium dodecyl sulfonate in a mixture of 250 ml of acetonitrile and 250 ml of 0.02 mol/L potassium dihydrogen phosphate, adjust to pH 3.5 with phosphoric acid)-methanol (1:1) as the mobile phase. Detection wavelength is 215 nm and the number of theoretical

plates of the column is not less than 3000, calculated with reference to the peak of ibuprofen. The resolution factor between the peaks of ibuprofen and pseudoephedrine hydrochloride complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powder equivalent to 100 mg of ibuprofen and 15 mg of pseudoephedrine hydrochloride respectively, in a 50 ml volumetric flask with methanol and dilute to volume, mix well. Filter and accurately transfer 5 ml of the successive filtrate in a 50 ml volumetric flask, dilute with methanol to volume, mix well. Accurately inject 20 μ l into the column, record the chromatogram. Repeat the operation, using ibuprofen CRS and pseudoephedrine hydrochloride CRS instead of the substance being examined. Calculate the content of $C_{13}H_{18}O_2$ and $C_{10}H_{15}NO \cdot HCl$ respectively with respect to the peak area obtained in chromatogram by the external standard method.

Category Anti-inflammatory and analgesic, vasoconstrictor.

Storage Preserve in tightly closed containers.

Ichthammol

Ichthammol contains not less than 10.5% of organically combined sulfur (s), and the content of inorganic sulfur (s) is not more than 25.0% of the total sulfur, calculated on the dried basis.

Description A brownish-black, viscous liquid; odour, characteristic.
Soluble in water.

Identification (1) Heat with an equal volume of sodium hydroxide TS, an ammonia odour is received.

(2) Dissolve about 1 g in 50 ml of water, add a small quantity of hydrochloric acid, a brown precipitate is produced; a blackish-brown resinous precipitate is deposited on the inner wall and bottom of the container on standing.

Solubility in water Stir to dissolve 0.50 g in 50 ml of water in a 100 ml beaker. Transfer to a 50 ml Nessler cylinder, examine at a distance of 10-20 cm under 25 W incandescent light. It is a brown homogeneous solution without any granules or liquid drops.

Solubility in glycerol 1.0 g dissolve completely in 9 ml of glycerol.

Loss on drying Weigh accurately about 1 g, add 5 ml of anhydrous ethanol and macerate for 15 minutes. When dried to constant weight at 105°C, it loses not more than 50.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.25% (Appendix VIII N).

Assay Total sulfur Mix 0.5 g, accurately weighed, with 4 g of anhydrous sodium carbonate and 3 ml of chloroform in a crucible, heat gently with stirring to evaporate chloroform, crush the residue. Add 10 g of coarsely powdered copper nitrate, mix thoroughly and heat the mixture with a small flame. When the oxidative reaction has subsided, raise the temperature slightly until most of the material has been charred, cool, add 20 ml of hydrochloric acid. When the reaction has ceased, transfer the molten mass to a beaker with 100 ml of water in portions and boil until all the copper oxides are dissolved. Filter and wash the residue with water in portions, combine the washings with the filtrate, add water to about 200 ml, boiling and add 40 ml of barium chloride TS. Heat for 30 minutes on a water bath, allow it

to cool, filter through an ashless filter paper. Wash the precipitate with warm water in portions until the washing is free from chloride, dry and ignite to constant weight. Perform a blank determination and make any necessary correction. Each g of residue is equivalent to 0.1374 g of total sulfur.

Inorganic sulfur Dissolve 2 g, accurately weighed, in 100 ml of water in a 250 ml beaker (heat if necessary), add 20 ml of 10% copper chloride solution, mix well and boil. Allow the solution to cool, add 5 ml of ammonia TS, mix well and filter. Transfer the filtrate to a 200 ml volumetric flask, wash the precipitate with water in portions, combine the washings with the filtrate, add water to volume, mix well. Measure accurately 100 ml, boil and neutralize with hydrochloric acid, add 1 ml of hydrochloric acid and 10 ml of barium chloride TS slowly, heat for 30 minutes on a water bath, allow to cool to room temperature. Filter through an ashless filter paper, wash the precipitate with warm water in portions until the washing is free from chloride, dry and ignite to constant weight. Perform a blank determination and make any necessary correction. Each g of residue is equivalent to 0.1374 g of inorganic sulfur.

Organic sulfur Calculated by subtracting the percentage content of inorganic sulfur from the percentage content of total sulfur.

Category Antiseptic disinfectant

Storage Preserve in tightly closed containers and stored in a cool place.

Preparation Ichthammol Ointment

Ichthammol Ointment

Description Brownish-black ointment; odour, characteristic.

Identification (1) Heat about 0.5 g with 1 ml of sodium hydroxide TS in a test tube, an ammonia odour is evolved, and the vapour turns moistened red litmus paper to blue.

(2) Heat about 5 g with 25 ml of water, stir to dissolve ichthammol, allow to cool and filter. To the filtrate add a small quantity of hydrochloric acid, a brown precipitate is produced; a blackish-brown resinous precipitate is deposited on the inner wall and bottom of the container on standing.

Other requirements Comply with the general requirements for ointments (Appendix I F).

Category As described under Ichthammol.

Strength 10%

Storage Preserve in well closed containers.

Idoxuridine

$C_9H_{11}IN_2O_5$ 354.10

[54-42-2]

Idoxuridine is 2'-deoxy-5-iodo-uridine. It contains not less than 97.0% and not more than 103.0% of

$C_9H_{11}IN_2O_5$, calculated on the dried basis.

Description A white crystalline powder.

Slightly soluble in water, methanol, ethanol or acetone; practically insoluble in chloroform or ether; freely soluble in sodium hydroxide TS; slightly soluble in dilute hydrochloric acid.

Melting range 176-184°C with decomposition (Appendix VI C).

Specific optical rotation +25° to +30° in a solution of 10 mg per ml in sodium hydroxide TS measured at 25°C (Appendix VI E).

Identification (1) Heat 2 mg to melt, violet vapour is evolved.

(2) To 2 mg add 0.2 ml of water and 2 drops of 5% cysteine hydrochloride solution then add 2 ml of sulfuric acid solution (7→10) slowly. A pink colour is produced, which changes to brownish-red gradually.

(3) The light absorption of the solution obtained in Assay exhibits a maximum at 279 nm and a minimum at 253 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of idoxuridine (Appendix XVI).

5-Iodo-uridine Measure the light absorbance of the solution obtained in Assay, the ratio of the absorbance at 303 nm to that at 279 nm is not more than 0.40 (Appendix IV A).

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity in 0.01 mol/L sodium hydroxide solution to produce a solution of 30 µg per ml, measure the absorbance at 279 nm (Appendix IV A). Calculate the content of $C_9H_{11}IN_2O_5$, taking 158 as the value of A (1%, 1 cm).

Category Antiviral.

Storage Preserve in tightly closed containers, protected from light.

Preparation Idoxuridine Eye Drops

Idoxuridine Eye Drops

Idoxuridine Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of idoxuridine ($C_9H_{11}IN_2O_5$). A suitable quantity of preservative may be added.

Description A clear, colourless liquid.

Identification (1) Heat 2 ml with 2 ml of 5% sulfuric acid solution and 0.2 g of zinc powder in a water bath for 10 minutes, cool to room temperature and filter. To the filtrate add a drop of potassium dichromate TS and 1 ml of starch IS; a blue colour is produced.

(2) To 3 ml add 2 drops of 5% cysteine hydrochloride solution, and mix. Add 3 ml of sulfuric acid with caution to produce two layers; a brown colour is produced at the interface.

pH value 4.0-7.0 (Appendix VI H).

5-Iodo-uridine Measure the light absorbance of the solution obtained in Assay, the ratio of the absorbance at 303 nm to that at 279 nm is not more than 0.41 (Appendix IV A).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Transfer 5 ml, accurately measured, to a 200 ml volumetric flask, dilute with 0.01 mol/L sodium hydroxide solution to volume and mix well. Measure the absorbance at 279 nm (Appendix IV A). Calculate the content of $C_{19}H_{24}N_2 \cdot HCl$, taking 158 as the value of A (1%, 1 cm).

Category As described under Idoxuridine.

Strength (1) 8 ml : 8 mg (2) 10 ml : 10 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Imipramine Hydrochloride

$C_{19}H_{24}N_2 \cdot HCl$ 316.88

[113-52-0]

Imipramine Hydrochloride is *N*, *N*-dimethyl-10, 11-dihydro-5*H*-dibenz (*b*, *f*) azepine-5-propan-amine hydrochloride. It contains not less than 98.0% of $C_{19}H_{24}N_2 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless; discoloured on exposure to light.

Freely soluble in water, ethanol or chloroform; practically insoluble in ether.

Melting range 170–175°C (Appendix VI C).

Identification (1) Dissolve about 5 mg in 2 ml of nitric acid, a deep blue colour is produced immediately.

(2) The light absorption of a 20 µg per ml solution in hydrochloric acid solution (9→1000) exhibits a maximum at 251 nm; the absorbance is about 0.53 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of imipramine hydrochloride (Appendix XVI).

(4) Dissolve about 50 mg in water, make alkaline with ammonia TS and filter. The filtrate, acidified with nitric acid, yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of solution Dissolve 1.0 g in 10 ml of water, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y_3 (Appendix IX A, method 1).

Acidity Dissolve 1.0 g in 10 ml of water, pH 4.2–5.2 (Appendix VI H).

Iminodibenzyl To 50 mg in a 20 ml volumetric flask add 10 ml of hydrochloric acid-ethanol (1 : 1). Add 5 ml of a 0.4% solution of furfural in ethanol and 5 ml of hydrochloric acid under cooling, mix well. Allow to stand in a dark place at 25°C for 3 hours. Dilute with hydrochloric acid-ethanol (1 : 1) to volume. Measure the absorbance at 565 nm, not greater than 0.25 (Appendix IV A).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-glacial acetic acid-hydrochloric acid-water (55 : 35 : 5 : 5) as the mobile

phase. Apply separately to the plate 10 µl each of two solutions in ethanol containing (1) 10 mg per ml and (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, spray with a 0.5% solution of potassium dichromate in a mixture of sulfuric acid-water (1 : 4) and examine immediately. No spot other than the principal spot in the chromatogram obtained with solution (1) is more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 10 ml of mercuric acetate TS. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.69 mg of $C_{19}H_{24}N_2 \cdot HCl$.

Category Antidepressant

Storage Preserve in tightly closed containers, protected from light.

Preparation Imipramine Hydrochloride Tablets

Imipramine Hydrochloride Tablets

Imipramine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$).

Description Sugar-coated or film-coated tablets with white core.

Identification (1) Weigh a quantity of the powdered tablets with coating removed equivalent to 0.1 g of imipramine hydrochloride, triturate with 10 ml of chloroform and filter. Evaporate the filtrate to dryness. The residue complies with tests (1) and (4) for Identification described under Imipramine Hydrochloride.

(2) The light absorption of a solution obtained in Assay exhibits a maximum at 251 nm (Appendix IV A).

Related substances Weigh accurately a quantity of the powdered tablets equivalent to 0.2 g of imipramine hydrochloride. Extract with three 10 ml portions of chloroform, filter, evaporate the combined extracts to dryness. Dissolve the residue in 10 ml of ethanol (solution 1). Dilute an accurately measured quantity of solution (1) with ethanol to produce a solution of 0.2 mg per ml (solution 2). Carry out the test for Related substances described under Imipramine Hydrochloride.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Measure the absorbance of the successive filtrate at 251 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{24}N_2 \cdot HCl$ from each tablet, taking 264 as the value of A (1%, 1cm), not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating

removed. Transfer an accurately weighed quantity of the powdered tablets, equivalent to 75 mg of imipramine hydrochloride, to a 250 ml volumetric flask, add about 80 ml of hydrochloric acid solution (9→1000) and shake to dissolve imipramine hydrochloride. Dilute to volume with the same solvent, shake thoroughly, filter. Dilute 5 ml of the successive filtrate accurately measured, in a 100 ml volumetric flask with hydrochloric acid solution (9→1000) to volume, mix well. Measure the absorbance of the resulting solution at 251 nm (Appendix IV A). Calculate the content of $C_{19}H_{24}N_2 \cdot HCl$, taking 264 as the value of A (1%, 1 cm).

Category As described under Imipramine Hydrochloride.

Strength (1) 12.5 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Indapamide

$C_{16}H_{16}ClN_3O_3S$ 365.83

[26807-65-8]

Indapamide is 4-chloro-*N*-(2-methyl-1-indolyl)-3-sulfamoylbenzamide. It contains not less than 98.5% of $C_{16}H_{16}ClN_3O_3S$, calculated on the dried basis.

Description Almost white needle crystals or a crystalline powder; odourless; tasteless.

Freely soluble in acetone or glacial acetic acid; soluble in ethanol or ethyl acetate; slightly soluble in chloroform or ether; practically insoluble in water or dilute hydrochloric acid.

Melting range 162-167°C, the substance forms a curve surface of crescent moon that temperature is regarded as the end of melting (Appendix VI C).

Identification (1) Dissolve about 50 mg in 3 ml of water, shake, add 0.5 ml of hydrogen peroxide TS, shake well, heat gently to nearly boil, cool to room temperature and filter. Add 3 drops of ferric chloride TS to the filtrate, shake and add 1-2 drops of sodium hydroxide TS; a brownish red precipitate is produced.

(2) To about 50 mg add 1-2 ml of sodium hydroxide solution (0.4→100) dropwise to produce a saturated solution, filter. Add 1 drop of cupric sulfate TS to the filtrate, a yellowish brown or brown precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of indapamide (Appendix XVI).

(4) To about 50 mg in a porcelain crucible add 0.2 g of anhydrous sodium carbonate, mix, ignite until the incineration is complete. Cool, add 5 ml of water, heat to boil, cool to room temperature and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Related substances Dissolve a quantity of the substance being examined in the mobile phase by shaking in a hot water bath, dilute with the mobile phase to produce a solution of about 0.5 mg per ml as the test solution. Dilute a quantity of above solution, accurately measured, with the mobile phase

to produce a solution of about 5 µg per ml as the reference solution. Carry out the method described under Assay. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column and record the chromatogram for three times the retention time of the principal peak. The sum of the secondary peak areas is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 2.4% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-glacial acetic acid (45 : 55 : 0.1) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of indapamide. The retention time of the peak of indapamide and internal standard complies with the related requirements.

Internal standard solution Dissolve 20 mg of acetanilide in 5 ml of methanol and dilute to 100 ml with the mobile phase.

Procedure Dissolve about 20 mg of indapamide CRS, accurately weighed, in 5 ml of methanol in a 100 ml volumetric flask and dilute to volume with the mobile phase, mix well. Transfer 10 ml of the resulting solution and 5 ml of the internal standard solution, both accurately measured, into a 50 ml volumetric flask, dilute to volume with the mobile phase, mix well. Inject 20 µl of the resulting solution and record the chromatogram. Repeat the operation using a quantity of the substance being examined instead of indapamide CRS. Calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Category Hypotensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Indapamide Tablets

Indapamide Tablets

Indapamide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of indapamide ($C_{16}H_{16}ClN_3O_3S$).

Description Sugar coated tablets with white core.

Identification (1) Triturate a quantity of powder equivalent to about 50 mg of indapamide with 20 ml of acetone, filter, evaporate the filtrate on water bath to dryness. The residue complies with tests (1) and (2) for Identification described under Indapamide.

(2) A quantity of powder equivalent to about 25 mg of indapamide complies with test (4) for Identification described under Indapamide.

Related substances To a quantity of the powder add a quantity of the mobile phase, shake for 5 minutes in a hot water bath to dissolve indapamide. Dilute with the mobile phase to produce a solution of 0.5 mg per ml, filter, taking

the successive filtrate as the test solution. Carry out the test for Related substances described under Indapamide, beginning at the words "dilute a quantity of above solution".

Content uniformity Comply with the requirement (Appendix X E). Triturate 1 tablet with a quantity of ethanol in a mortar, transfer to a 100 ml volumetric flask with ethanol in portions, shake thoroughly, dilute to volume and mix well, filter. Measure accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, dilute to volume and mix well. Measure the absorbances of this solution and the reference solution under the Assay at 242 nm (Appendix IV A), calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Dissolution Carry out dissolution test (Appendix X C, method 2), using 900 ml of ethanol-water (5 : 895) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 45 minutes and filter. Measure the absorbance of the successive filtrate at 242 nm (Appendix IV A). Dissolve 25 mg of indapamide CRS, accurately weighed, in a 50 ml volumetric flask in ethanol and dilute to volume, mix well. Measure accurately 10 ml of this solution in a 100 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 5 ml of this solution in 100 ml volumetric flask, dilute to volume with water and mix well. Repeat the operation, calculate the dissolution of $C_{16}H_{16}ClN_3O_3S$ from each tablet. Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Shake well and accurately weighed quantity of the powder equivalent to 5.0 mg of indapamide with a quantity of ethanol in a 100 ml volumetric flask, dilute to volume and mix well, filter. Measure accurately 5 ml of the successive filtrate in a 50 ml volumetric flask, dilute to volume and mix well. Weigh accurately a quantity of indapamide CRS, add ethanol to produce a solution of 5.0 μg per ml. Measure the absorbances of the solutions at 242 nm (Appendix IV A). Calculate the content of $C_{16}H_{16}ClN_3O_3S$.

Category As described under Indapamide.

Strength 2.5 mg

Storage Preserve in tightly closed containers, protected from light.

Indocyanine Green

$C_{43}H_{47}N_2NaO_6S_2$ 774.96

[3599-32-4]

Indocyanine Green is 2-[7-[1, 1-Dimethyl-3-(4-sulfobutyl) benz[e]indolin-2-ylidene]-1, 3, 5-heptatrienyl]-1, 1-dimethyl-3-(4-sulfobutyl)-1H-benz[e]indolium hydroxide, inner salt, sodium salt. It contains not less than 94.0% and not more than 105.0% of $C_{43}H_{47}N_2NaO_6S_2$, calculated on the dried basis.

Description A dark olive-green, or dark brown red powder; odourless; deteriorated easily on exposure to light and heat. Soluble in water or methanol; practically insoluble in acetone.

Identification (1) Dissolve 10 mg in 5 ml of water, add 10 drops of sodium hydroxide TS, and heat to about 60°C. Add 10 drops of 3% hydrogen peroxide solution: a dark red brown colour is produced, which changes to orange-yellow on standing.

(2) The light absorption of a solution obtained in Assay exhibits three maxima at 216 nm, 263 nm and 784 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Indocyanine Green (Appendix XVI).

(4) Ignite a portion of it; the residue yields the reactions characteristic of sodium and sulfate (Appendix III).

Loss on drying When dried in vacuum at 50°C for 3 hours, loses not more than 6.0% of its weight (Appendix VIII L).

Heavy metals Place 1.0 g in a crucible, heat gently until the substance is charred, and cool to room temperature. Add 2 ml of nitric acid and 5 drops of sulfuric acid, heat until white fumes are no longer evolved. Ignite at 500-600°C unless the substance is thoroughly incinerated, and cool to room temperature. Add 2 ml of hydrochloric acid, evaporate to dryness on a water bath. Moisten the residue with 3 drops of hydrochloric acid, add 7 ml of hot water, heat for 2 minutes, and add 1 drop of phenolphthalein IS, add ammonia TS until a pale red is produced. Add 0.4 ml of dilute acetic acid, filter if necessary, transfer to a Nessler cylinder, wash the crucible with 2 ml of water, dilute with water to 10 ml, as the test solution. Evaporate 2 ml of nitric acid, 5 drops of sulfuric acid and 2 ml of hydrochloric acid to dryness on a water bath. Moisten the residue with 3 drops of hydrochloric acid, add 7 ml of hot water, heat for 2 minutes, and add 1 drop of phenolphthalein IS, add ammonia TS until a pale red is produced. Add 0.4 ml of dilute acetic acid, transfer to another Nessler cylinder, add 1.0 ml of standard lead solution, dilute with water to 10 ml, as the reference solution. To each of the tubes containing the reference solution and the test solution, add 1 drop of sodium sulfide TS (Dissolve 5 g of sodium sulfide in 10 ml of water, add 30 ml of glycerin, mix well. Store in a refrigerator and use within 3 months), mix well and allow to stand for 5 minutes. Carry out the limit test for heavy metals (Appendix VIII H); not more than 0.001%.

Arsenic Mix about 0.25 g with 0.5 g of sodium hydroxide, add a quantity of water and stir well. After it is evaporated to dryness, heat gently first until the substance is charred, and then ignite at 600-700°C unless the substance is thoroughly incinerated, and cool to room temperature. Dissolve in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J); not more than 0.0008%.

Sodium iodide Dissolve about 0.2 g, accurately weighed, in 100 ml of water, add 1 ml of nitric acid, mix well. Carry out the method for potentiometric titration (Appendix VII A), titrate with silver nitrate (0.01 mol/L) VS, using silver and glass electrodes. Each ml of silver nitrate (0.01 mol/L) VS is equivalent to 1.499 mg of NaI. Not more than 5.0% of sodium iodide, calculated on the dried basis.

Assay Dissolve a quantity, accurately weighed, in methanol and dilute to produce a solution of about 2 μg per ml. Measure the absorbance of the resulting solution at 784 nm (Appendix IV A), calculate the content of $C_{43}H_{47}N_2NaO_6S_2$ taking 3120 as the value of A (1%, 1 cm).

Category Diagnostic.

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Preparation Indocyanine Green for Injection

Indocyanine Green for Injection

Indocyanine Green for Injection is a sterile lyophilized preparation of indocyanine green. It contains not less than 90.0% and not more than 110.0% of the labelled amount of indocyanine green ($C_{43}H_{47}N_2NaO_6S_2$).

Description A dark olive-green lyophilized mass; deteriorated easily on exposure to light and heat.

Identification (1) Dissolve 10 mg in 5 ml of water, add 10 drops of sodium hydroxide TS, and heat to about 60°C. Add 10 drops of 3% hydrogen peroxide solution; a dark red colour is produced, which changes to orange-yellow on standing.

(2) Ignite a portion of it; the residue yields the reactions characteristic of sodium and sulfate (Appendix III).

Acidity Dissolve 50 mg in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Content uniformity Carry out the method described under Assay, using 5 vials. Calculate the content of $C_{43}H_{47}N_2NaO_6S_2$ in each vial and the average content of 5 vials. Not more than 1 vial of the individual content deviates from the average content by more than 15%, and none of the individual content deviates by more than 20%.

Sterility Complies with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of five containers separately in a quantity of methanol, transfer to 10 ml volumetric flasks, and wash the containers with methanol in portions. Combine the washings to the same volumetric flask and dilute to volume with methanol. Dilute a quantity, accurately measured, with methanol to produce a solution of 2.5 µg per ml. Measure the absorbance of the solution at 784 nm (Appendix IV A), calculate the content of $C_{43}H_{47}N_2NaO_6S_2$ in each container, taking 3120 as the value of A (1%, 1 cm), and calculate the average content of the five containers.

Category As described under Indocyanine Green.

Strength (1) 10 mg (2) 25 mg

Storage Preserve in well closed containers, stored in a cold place and protected from light.

Indometacin

$C_{19}H_{16}ClNO_4$ 357.79

[53-86-1]

Indometacin is 1-(4-chlorobenzoyl)-5-methoxy-2-methyl-1H-

indole-3-acetic acid. It contains not less than 99.0% of $C_{19}H_{16}ClNO_4$, calculated on the dried basis.

Description An almost white to pale yellow crystalline powder; almost odourless; tasteless.

Soluble in acetone; sparingly soluble in methanol, ethanol, chloroform or ether; slightly soluble in benzene; very slightly soluble in toluene; practically insoluble in water.

Melting range 158-162°C (Appendix VI C).

Specific absorbance Dissolve 50 mg, accurately weighed, in 50 ml of methanol in a 100 ml volumetric flask and shake, add phosphate BS (pH 7.2) to volume and mix well. Measure accurately 5 ml of the solution to 100 ml volumetric flask, dilute with a mixture of methanol-phosphate BS (pH 7.2) (1 : 1) to volume and mix well. Measure the absorbance of the resulting solution at 320 nm (Appendix IV A), the value of A (1%, 1 cm) is 185-200.

Identification (1) Dissolve about 10 mg in a mixture of 10 ml of water and 2 drops of 20% sodium hydroxide solution. To 1 ml of the solution add 0.3 ml of 0.03% potassium dichromate solution, heat to boiling and allow to cool to room temperature. Add 2-3 drops of sulfuric acid, then heat gently on a water bath; a violet colour is produced. Heat another 1 ml of the solution to boiling with 0.3 ml of 0.1% sodium nitrite solution and allow to cool to room temperature. Add 0.5 ml of hydrochloric acid; a green colour is produced, turning to yellow on standing.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of indometacin (Appendix XVI).

Chloride Shake thoroughly 0.30 g with 25 ml of water for 3 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using the filtrate. Any opalescence produced is not more pronounced than that of a reference using 6.0 ml of sodium chloride standard solution (0.02%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.1 mol/L glacial acetic acid solution (50 : 50) as the mobile phase. Detection wavelength is at 228 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of indometacin, the resolution factor between the peaks of indometacin and the adjacent impurity complies with the related requirements. To a quantity equivalent to about 50 mg of indometacin to 100 ml volumetric flask add a quantity of ethanol, shake to dissolve indometacin and dilute with ethanol to the volume, mix well. Measure 5 ml in 25 ml volumetric flask and dilute with 50% ethanol solution to the volume, use as the test solution. Measure accurately 1 ml of the test solution to 200 ml volumetric flask and dilute with 50% ethanol solution to the volume to produce the reference solution. Inject 50 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 50 µl each of the test and reference solution, into the column and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the principal peak area of the reference solution.

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Not more than 0.001%, using the residue obtained in the test for Residue on ignition (Appendix VIII H,

method 2).

Assay Dissolve about 0.5 g, accurately weighed, in 30 ml of ethanol with gentle heating and allow to cool. Add 20 ml of water and 7-8 drops of phenolphthalein IS, titrate immediately with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 35.78 mg of $C_{19}H_{16}ClNO_4$.

Category Analgesic and antipyretic, non-steroids anti-inflammatory.

Storage Preserve in tightly closed containers, protected from light.

Preparation

- (1) Indometacin Capsules
- (2) Indometacin Cream
- (3) Indometacin Enteric-Coated Tablets
- (4) Indometacin Liniment
- (5) Indometacin Patches
- (6) Indometacin Suppositories

Indometacin Capsules

Indometacin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of indometacin ($C_{19}H_{16}ClNO_4$).

Identification Shake thoroughly a quantity of the contents of the capsules equivalent to about 10 mg of indometacin with 10 ml of water, add 3 drops of 20% sodium hydroxide solution and shake to dissolve indometacin, filter. The filtrate complies with test (1) for Identification described under Indometacin.

Related Substances Use the test solution obtained in Assay as the test solution. Measure 1 ml of the test solution in 100 ml volumetric flask and dilute with 50% ethanol solution to the volume, use as the reference solution. Proceed as described under Assay, inject 50 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 50 μ l each of the test and reference solution, into the column and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than principal peak in the chromatogram obtained with the test solution is not greater than twice of the principal peak area of the reference solution (2.0%).

Content uniformity Comply with the requirements (Appendix X E). Transfer the content of 1 capsule to a 50 ml volumetric flask, wash the shell with 35 ml of methanol in portions, transfer the washings into the same volumetric flask. Warm and shake thoroughly to dissolve indometacin, cool to room temperature, add methanol to volume, mix well and allow to stand. Measure accurately 5 ml of the supernatant liquid to a 100 ml volumetric flask, add a mixture of methanol-phosphate BS (pH 7.2) (1 : 1) to volume and mix well. Measure the absorbance of the solution at 320 nm (Appendix IV A). Calculate the content of $C_{19}H_{16}ClNO_4$, taking 193 as the value of A (1%, 1 cm).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of phosphate BS (pH 7.2)-water (1 : 4) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Measure the absorbance of the successive filtrate at 320 nm (Appendix IV A) and calculate the dissolution of $C_{19}H_{16}ClNO_4$ from each capsule, taking

193 as the value of A (1%, 1cm), not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.1 mol/L glacial acetic acid solution (50 : 50) as the mobile phase. Detection wavelength is at 228 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of indometacin, the resolution factor between the peaks of indometacin and the adjacent impurity complies with the related requirements. Weigh accurately 20 capsules, remove the content. To a quantity equivalent to about 50 mg of indometacin, accurately weighed, add a quantity of ethanol to 100 ml volumetric flask, shake to dissolve indometacin and dilute with ethanol to the volume, mix well and filter. Measure 5 ml of the successive filtrate in 25 ml volumetric flask and dilute with 50% ethanol solution to the volume, mix well, use as the test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Weigh accurately 25 mg of indometacin CRS to 50 ml volumetric flask and add a quantity of ethanol, shake to dissolve indometacin and dilute with ethanol to the volume, mix well. Measure accurately a quantity and dilute with 50% ethanol solution to produce the reference solution of 0.1 mg per ml. Repeat the operation, calculate the content of $C_{19}H_{16}ClNO_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Indometacin.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Indometacin Cream

Indometacin Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of Indometacin $C_{19}H_{16}ClNO_4$.

Description A pale yellow cream.

Identification To about 2.5 g add 50 ml of cyclohexane and 25 ml of methanol, shake to extract. Allow to stand and separate, using the lower layer of methanol, carry out the test for Identification as follows.

(1) To 1 ml of the methanol solution add 3-4 drops of 0.1 mol/L sodium hydroxide solution and 0.5 ml of 0.03% potassium dichromate solution, heat to boiling and cool. Add 4-5 drops of sulfuric acid, heat gently on a water bath; a violet colour is produced.

(2) To 1 ml of methanol solution add 3-4 drops of 0.1 mol/L sodium hydroxide solution and 0.5 ml of 0.1% sodium nitrite solution, heat to boiling and cool. Add 0.5 ml of hydrochloric acid; a green colour is produced, turning to yellow on standing.

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay **Reference solution** Dissolve 50 mg of indometacin CRS, accurately weighed, in a 100 ml volumetric flask with methanol and dilute to volume, mix well. Measure accurately 5 ml to a 100 ml volumetric flask, dilute with a mixture of phosphate BS (pH 7.0)-methanol (1 : 1) to volume, mix well.

Test solution Dissolve a quantity accurately weighed, equivalent about 50 mg of indometacin in a separator, with 50 ml of cyclohexane and 25 ml of methanol by shaking, allow to stand, separate the lower layer of solution to another separator containing 100 ml of 2% sodium chloride solution. Extract the supernatant solution with 15 ml and 10 ml of methanolic sodium chloride solution (To 20 ml of 10% sodium chloride solution dilute with methanol to 100 ml, mix well) separately, combine the lower layer of extracts to the above separator and extract with 25 ml, 20 ml and 10 ml of chloroform separately, filter all the chloroform extracts through a same filter containing 10 g dehydrated sodium sulfate to a beaker. Evaporate the extracts in a water bath of 70°C to dryness. Add 20 ml of methanol to the residue, warm to dissolve, cool and filter, transfer the filtrate to a 100 ml volumetric flask, wash the filter with methanol, combine the washing and the filtrate, dilute with methanol to volume, mix well. Measure accurately 5 ml to a 100 ml volumetric flask, dilute with a mixture of phosphate BS (pH 7.0)-methanol (1 : 1) to volume, mix well, filter, collect the successive filtrate as the test solution.

Procedure Measure the absorbances of the two solutions at 320 nm (Appendix IV A), calculate the content of $C_{19}H_{16}ClNO_4$.

Category As described under Indometacin.

Strength 10 g : 100 mg

Storage Preserve in tightly closed containers, stored in cool place, protected from light.

Indometacin Enteric-coated Tablets

Indometacin Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of indometacin ($C_{19}H_{16}ClNO_4$).

Description Enteric-coated tablets with white core.

Identification Powder finely some tablets with enteric-coating removed. Shake thoroughly a quantity of the powdered tablets equivalent to about 10 mg of indometacin with 10 ml of water, add 2 drops of 20% sodium hydroxide solution and shake to dissolve indometacin, filter. The filtrate complies with test (1) for Identification described under Indometacin.

Drug release Carry out the drug release test (Appendix X D, method 2 (2)), with the apparatus of dissolution test method 1 and using 1000 ml of 0.1 mol/L hydrochloric acid solution as the release medium, adjust the rotational speed of the basket to 100 rpm. Stop rotating after exactly 2 hours, elevate the basket from the liquid, no tablet shows signs of cracks or disintegration. Replace the basket into 1000 ml of phosphate BS (pH 6.8), keep the same rotational speed as above. Withdraw a quantity of the solution after exactly 45 minutes and filter. Measure the absorbance of the filtrate at 320 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{16}ClNO_4$ from each tablet, taking 196 as the value of A (1%, 1cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets with enteric-coating removed. Weigh accurately a quantity of the powdered tablets equivalent to about 25 mg of indometacin and dissolve in 35 ml of methanol in a 50 ml volumetric flask with warming. Allow to cool to room temperature, add methanol to volume, shake thoroughly and filter. Measure

accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add methanol-phosphate BS (pH 7.2) (1 : 1) to volume and mix well. Measure the absorbance of the resulting solution at 320 nm (Appendix IV A), calculate the content of $C_{19}H_{16}ClNO_4$, taking 193 as the value of A (1%, 1 cm).

Category As described under Indometacin.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Indometacin Liniment

Indometacin liniment contains not less than 90.0% and not more than 110.0% of the labelled amount of indometacin ($C_{19}H_{16}ClNO_4$).

Description A clear, slightly viscous yellow liquid.

Identification Dilute 2 ml equivalent to about 20 mg of indometacin to 10 ml with water, add 2-3 drops of 20% sodium hydroxide solution, and mix well. The resulting solution complies with the following tests.

(1) To 1 ml add 0.3 ml of 0.03% potassium dichromate solution, heat to boiling and cool to room temperature, add 2-3 drops of sulfuric acid, warm gently on a water bath; a red-violet colour is produced.

(2) To 1 ml add 0.3 ml of 0.1% sodium nitrite solution, heat to boiling and cool to room temperature, add 0.5 ml of hydrochloric acid; a green colour is produced, which turns to yellow gradually on standing.

pH value 6.0-7.0 (Appendix VI H).

Ethanol content 52.0%-62.0% (Appendix VII E).

Other requirements Complies with the general requirements for liniments (Appendix I T).

Assay Measure accurately a quantity equivalent to about 50 mg of indometacin into a 100 ml volumetric flask, dilute to volume with methanol, and mix well. Measure accurately 5 ml into another 100 ml volumetric flask, dilute to volume with methanol-phosphate BS (pH 7.2) (1 : 1), and mix well. Measure the absorbance of the resulting solution at 320 nm (Appendix IV A), calculate the content of $C_{19}H_{16}ClNO_4$, taking 193 as the value of A (1%, 1 cm).

Category As described under Indometacin.

Strength (1) 20 ml : 200 mg (2) 50 ml : 500 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Indometacin Suppositories

Indometacin Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of indometacin ($C_{19}H_{16}ClNO_4$).

Description White to pale yellow suppositories made by incorporating indometacin in fatty bases.

Identification To a quantity equivalent to about 50 mg of indometacin add a mixture of 50 ml of water and 0.5 ml of 20% sodium hydroxide solution, heat and stir to dissolve indometacin. Allow to cool until the mass just solidifies and filter. The filtrate complies with test (1) for Identification described under Indometacin.

Related Substances Use the test solution obtained in Assay as the test solution. Measure accurately 1 ml of the test solution in 100 ml volumetric flask and dilute with 50% ethanol solution to the volume, use as the reference solution. Proceed as described under Assay, inject 50 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 50 μ l each of the test and reference solution, into the column and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than principle peak in the chromatogram obtained with the test solution is not greater than twice of the principal peak area of the reference solution.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile -0.1 mol/L glacial acetic acid solution (50 : 50) as the mobile phase. Detection wavelength is at 228 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of indometacin, the resolution factor between the peaks of indometacin and the adjacent impurity complies with the related requirements. Weigh accurately 10 suppositories, cut carefully and mix well. To a quantity equivalent to about 25 mg of indometacin, accurately weighed, add a quantity of ethanol to 50 ml volumetric flask, heat on water bath to dissolve indometacin, cool to room temperature and dilute with ethanol to the volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in 25 ml volumetric flask and dilute with 50% ethanol solution to the volume, mix well, use as the test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Weigh accurately 25 mg of indometacin CRS to 50 ml volumetric flask and add a quantity of ethanol, shake to dissolve indometacin and dilute with ethanol to the volume, mix well. Measure accurately a quantity and dilute with 50% ethanol solution to produce the reference solution of 0.1 mg per ml. Repeat the operation, calculate the content of $C_{19}H_{16}ClNO_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Indometacin.

Strength (1) 25 mg (2) 50 mg (3) 100 mg

Storage Preserve in tightly closed containers, protected from light and stored at a temperature below 25°C.

Indometacin Patches

Indometacin patches contain not less than 80.0% and not more than 120.0% of the labelled amount of indometacin ($C_{19}H_{16}ClNO_4$).

Description Colourless, transparent, polyacrylate patches.

Identification Measure 40 ml of the methanol solution obtained in the Assay, equivalent to about 10 mg of indometacin, evaporate to dryness on a water bath. Add 10 ml of water and 2 drops of 20% sodium hydroxide solution to the residue, stir to dissolve indometacin and filter. The filtrate complies with the following tests.

(1) To 1 ml add 0.3 ml of 0.03% potassium dichromate solution, heat to boiling and cool to room temperature, add 2-3 drops of sulfuric acid, warm gently on a water bath; a violet colour is produced.

(2) To 1 ml add 0.3 ml of 0.1% sodium nitrite solution,

heat to boiling and cool, add 0.5 ml of hydrochloric acid; a green colour is produced, which turns to yellow gradually on standing.

Content uniformity Comply with the requirements for Content uniformity (Appendix X E). Cut a patch in chips and remove the protective layer. Transfer into a dried conical flask with stopper, add 50 ml, accurately measured, of methanol, carry out the method described under the Assay, beginning at the words "allow to stand in the place of protecting from light...". Calculate the content of $C_{19}H_{16}ClNO_4$. The limit of Content uniformity is $\pm 20\%$.

Other requirements Comply with the general requirements for patches (Appendix I V), with the exception of both content uniformity and drug release.

Assay Transfer 5 patches, cut in chips and remove the protective layer, into a dried conical flask with stopper, add 250 ml, accurately measured, of methanol, allow to stand in the place of protecting from light for 2 hours, mix well. Measure accurately 5 ml into a 50 ml volumetric flask, dilute to volume with methanol and mix well. Measure the absorbance of the resulting solution at 320 nm (Appendix IV A), calculate the content of $C_{19}H_{16}ClNO_4$, taking 179 as the value of A (1%, 1cm).

Category As described under Indometacin.

Strength 7.2 cm \times 7.2 cm, 12.5 mg (indometacin)

Storage Preserve in tightly closed containers, stored in a dry place.

Inosine

$C_{10}H_{12}N_4O_5$ 268.23

[58-63-9]

Inosine is 9 β -D-ribofuranosylhypoxanthine. It contains not less than 98.0% and not more than 102.0% of $C_{10}H_{12}N_4O_5$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter.

Sparingly soluble in water; insoluble in chloroform or ethanol; freely soluble in dilute hydrochloric acid and sodium hydroxide TS.

Identification (1) To a quantity of a solution containing 0.01% of the substance being examined add the same volume of 3, 5-dihydroxytoluene solution (dissolve 0.1 g of 3, 5-dihydroxytoluene and 0.1 g of ferric chloride in 100 ml of hydrochloric acid), mix well, heat in a water bath for 10 minutes; a green colour is produced.

(2) To a quantity of a solution containing 1% of the substance being examined, add several drops of ammoniated silver nitrate TS, a white colloidal precipitate is produced.

(3) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of inosine CRS.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Inosine (Appendix

XVI).

Transmittance of solution Dissolve 0.5 g in 50 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A) (for Injections).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (for Injections); or not more than 0.2% (for preparations of oral administration) (Appendix VII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 3), using 1.0 g; not more than 0.001%.

Related substances Dissolve a quantity of the substance being examined in water to produce a solution of 0.5 mg per ml as the test solution. Transfer 1 ml of the test solution, accurately measured, into a 100 ml volumetric flask, dilute with water to volume, mix well, and use this solution as the reference solution. Carry out the method described under the Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% of the scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution are not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (10 : 90) as the mobile phase. The detection wavelength is 248 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of inosine. Dissolve a quantity of the substance being examined, accurately weighed, in water to produce a solution of about 20 μ g per ml, mix well. Inject 20 μ l into the column, record the chromatogram. Repeat the operation, using inosine CRS instead of the substance being examined, calculate the content of $C_{10}H_{12}N_4O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Medicines for improving cell metabolism.

Storage Preserve in well closed containers, protected from light.

Preparation (1) Inosine Capsules (2) Inosine Injection
(3) Inosine Oral Solution (4) Inosine Tablets

Inosine Capsules

Inosine capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Inosine ($C_{10}H_{12}N_4O_5$).

Description Capsules containing white powder.

Identification (1) Dissolve a quantity of the contents of the capsules equivalent to about 0.2 g of inosine in 10 ml of water by shaking, filter and the successive filtrate complies with test (1) and (2) for identification described under Inosine.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of inosine CRS.

Other requirements Comply with the general requirements

for capsules (Appendix I E).

Assay Transfer an accurately weighed quantity of the triturated contents obtained in the test for weight variation of contents equivalent to about 0.1 g of inosine into a 100 ml volumetric flask, add about 70 ml of water, shake thoroughly to dissolve the inosine, dilute with water to volume and mix well. Filter and transfer 2 ml of the successive filtrate, measured accurately, into a 100 ml volumetric flask, dilute with water to volume, mix well. Carry out the method as described under Inosine, and calculate the content of $C_{10}H_{12}N_4O_5$.

Category As described under Inosine.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Inosine Injection

Inosine injection is a sterile solution of Inosine in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Inosine ($C_{10}H_{12}N_4O_5$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with tests (1), (2) and (3) for Identification described under Inosine.

pH value 8.5-9.5 (Appendix VI H)

Related substances Dilute a quantity of the substance being examined with water to produce a solution of 0.5 mg per ml as the test solution. Transfer 1 ml of the test solution, measured accurately, into a 50 ml volumetric flask, dilute with water to volume, mix well, and use this solution as the reference solution. Carry out the method described under Inosine. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.25 EU per mg.

Other requirements Complies with the general requirements for injections (Appendix I B)

Assay Dilute a quantity of the substance being examined, measured accurately, with water to produce a solution of about 20 μ g per ml. Carry out the Assay described under Inosine, and calculate the content of $C_{10}H_{12}N_4O_5$.

Category As described under Inosine.

Strength (1) 2 ml : 50 mg (2) 2 ml : 100 mg
(3) 5 ml : 100 mg (4) 5 ml : 200 mg

Storage Preserve in well closed containers, protected from light.

Inosine Oral Solution

Inosine oral solution is a solution of Inosine in water with stevioside or sucrose. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Inosine ($C_{10}H_{12}N_4O_5$).

Description A colourless to slightly yellow liquid.

Identification Complies with tests (2) and (3) for Identification described under Inosine.

pH value 7.5-8.5 (Appendix V H)

Other requirements Comply with the general requirements for oral solutions (Appendix I O).

Assay Dilute a quantity of the oral solution being examined, accurately measured, with water to produce a solution of about 20 µg per ml. Carry out the Assay described under Inosine, and calculate the content of $C_{10}H_{12}N_4O_5$.

Category As described under Inosine.

Strength (1) 10 ml : 0.1 g (2) 10 ml : 0.2 g
(3) 20 ml : 0.2 g (4) 20 ml : 0.4 g

Storage Preserve in tightly closed containers, protected from light.

Inosine Tablets

Inosine tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of Inosine ($C_{10}H_{12}N_4O_5$).

Description White or sugar coated or film coated tablets with white core.

Identification (1) Powder 2 tablets, add 10 ml of water to dissolve inosine, filter and the successive filtrate complies with tests (1) and (2) for Identification described under Inosine.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of inosine CRS.

Other requirements Comply with the general requirements for tablets (Appendix I A)

Assay Weigh accurately and powder finely 10 tablets (for sugar coated tablets remove the coating). Transfer an accurately weighed quantity of the powdered tablets equivalent to about 0.1 g of inosine into a 100 ml volumetric flask, add 70 ml of water, shake thoroughly to dissolve inosine, dilute with water to volume and mix well. Filter and transfer 2 ml of the successive filtrate, measured accurately, into a 100 ml volumetric flask, dilute with water to volume, mix well. Carry out the Assay described under Inosine, and calculate the content of $C_{10}H_{12}N_4O_5$.

Category As described under Inosine.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Insulin

Insulin is a hypoglycemic principle obtained from the pancreas of pigs or cattle. It has a potency of not less than 26 Units per mg, calculated on the dried basis.

Description A white or almost white crystalline powder. Practically insoluble in water, ethanol, chloroform or ether; freely soluble in solutions of mineral acids or sodium hydroxide.

Identification (1) 10 mg is completely soluble in 6 ml of water with pH of 2.5-3.0. Adjust with alkali to pH 5.1-5.3, a precipitate is produced, which is redissolved on acidifying to pH 2.5-3.5. Adjust with alkali to pH 8.0-8.5, only a slight turbidity is formed.

(2) Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (5 µm) and maintain the column temperature at 40°C. a mixture of 0.1 mol/L sodium dihydrogen phosphate solution (adjust to pH 3.0 with phosphoric acid) -acetonitrile (73 : 27) or a mixture of suitable proportion (contain 0.1 mol/L sodium sulfate) as the mobile phase with a flow rate of 1 ml per minute. Detection wavelength is 214 nm. Dissolve separately the substance being examined and Insulin (pigs or cattle) RS in 0.01 mol/L hydrochloric acid solution to produce the solutions of 40 Units per ml. Inject 5 µl of the resulting solutions into the column respectively. The retention time of the two principal peaks is concordant with each other.

(3) Dissolve an accurately weighed quantity in water (adjust with acid to pH 2.5-3.0) to produce a solution of 5 Units per ml. At 20-30°C, inject subcutaneously into five mice, weighing 20-24 g each, using 0.25 ml per 20 g of mouse's weight. The solution causes convulsions of not less than four mice in 2 hours. Immediately after convulsions occur in a mouse, inject intraperitoneally into that mouse 1 ml of 10% Dextrose Injection, the convulsions should be relieved.

Light absorption The light absorption of a solution of 0.5 mg per ml in 0.01 mol/L hydrochloric acid solution exhibits a maximum at 276 nm; the absorbance is 0.48-0.55 (Appendix IV A).

Related proteins Dissolve an accurately weighed quantity of Insulin RS in urea solution (to 96 g of urea, 1.5 g of trometamol and 12 ml of 1 mol/L hydrochloric acid solution add water to 200 ml) to produce five solutions containing (1) 0.5 µg per 100 µl, (2) 1.0 µg per 100 µl, (3) 3.0 µg per 100 µl, (4) 5.0 µg per 100 µl and (5) 100 µg per 100 µl. Dissolve an accurately weighed quantity of the substance being examined in above urea solution to produce two solutions containing (6) 100 µg per 100 µl and (7) 500 µg per 100 µl. Carry out the method for polyacrylamide gel electrophoresis (Appendix V F).

The test is not valid unless a band can be detected in the gel prepared with solution (1) and a gradation is observed in the intensity of staining of the gels prepared with solutions (1) to (4).

The principal band in the gel obtained with solution (6) and solution (7) corresponds in position to the principal band in the gel obtained with solutions (5).

In the gel prepared with solution (6) any band corresponding in position to a faster band behind the principal band in the gel prepared with solution (5) is not more intense than the principal band in the gel prepared with solution (3). In the gel prepared with solution (7) any band corresponding in position to a slower band behind the principal band in the gel prepared with solution (5) is not more intense than the principal band in the gel prepared with solution (1).

Proteins of higher molecular weight Dissolve about 100 mg of the substance being examined, accurately weighed, in 1 mol/L acetic acid solution to produce a solution of 50 mg per ml. Carry out the method for column chromatography (Appendix V C), using a column (80 cm × 2 cm) packed with about 50 g of glucosan gel G-50 (type of Ultra-fine) and 1 mol/L acetic acid solution as the eluent with a flow rate 22-25 ml per hour. Detection wavelength is 280 nm. Inject 0.6 ml of the resulting solution into the column. The sum of the areas of all the peaks eluting before the principal peak is not more than 1% of the total area of the peaks.

Nitrogen Carry out the method for determination of nitrogen (Appendix VII D, method 2): not less than 14.5% and not more than 16.0% of N, calculated on the dried basis.

Loss on drying When dried to constant weight at 105°C, loses not more than 10.0% of its weight (Appendix VIII L), using 0.2 g.

Zinc Transfer, separately, an accurately weighed quantity equivalent to about 40 Units and 1.6 ml of zinc standard solution (dissolve 44 mg of zinc sulfate, accurately weighed, in water in a 100 ml volumetric flask, dilute with water to volume and mix well. Transfer accurately 10 ml to another 100 ml volumetric flask, add water to volume and mix well, each ml of this solution is equivalent to 10 μ g of Zn) to two 10 ml volumetric flasks. To each flask add 2 ml of boric acid potassium chloride BS (pH 9.0) and 1 ml of freshly-prepared zincon test solution (dissolve 0.13 g of zincon in 2 ml of sodium hydroxide TS, add water to 100 ml), dilute with water to volume and mix well. Allow to stand for 30 minutes and measure the absorbances of the two solutions at 620 nm (Appendix IV A). Calculate the content of zinc: not more than 0.4 mg per 1000 Units.

Assay Carry out the biological assay of insulin (Appendix III G), the estimated potency is not less than 91% and not more than 110% of the labelled potency.

Category Hypoglycemic.

Storage Preserve in tightly closed containers, Stored at a temperature not higher than -15°C .

Preparation (1) Neutral Insulin Injection
(2) Protamine Zinc Insulin Injection

Neutral Insulin Injection

Neutral Insulin Injection is a sterile solution of Insulin (pigs or cattle) in Water for Injection. It has a potency of not less than 91% and not more than 116% of the labelled potency. It may contain 1, 4-1.6 g of glycine and 0.22 g of m-cresol per 100 ml.

Description A clear, colourless or almost colourless liquid.

Identification (1) Adjust the pH value of the injection with acid to about 5.5, a precipitate is produced, which is redissolved on acidifying to pH 2.5-3.5.

(2) Comply with test (2) for Identification described under Insulin. In the chromatogram, the first appearance is the peak of preservative, then appears the peak of Insulin, the retention time of the peak of insulin is identical with the principal peak of the same strain of insulin RS.

(3) Comply with test (3) for Identification described under Insulin.

pH value 6.6-8.0 (Appendix VI H).

Related proteins Transfer 10 ml, accurately measured, into a evaporating dish, after dried in vacuum, add the urea solution to produce solutions containing 2.6. Units per 100 μ l and 13 Units per 100 μ l (equivalent to about 100 μ g and 500 μ g respectively). Comply with the requirement described under Insulin, using the resulting solutions.

Zinc Comply with the requirement described under Insulin, using a quantity equivalent to about 40 Units.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.8 EU per Unit.

Other requirements Complies with the general requirements for injections (Appendix I B).

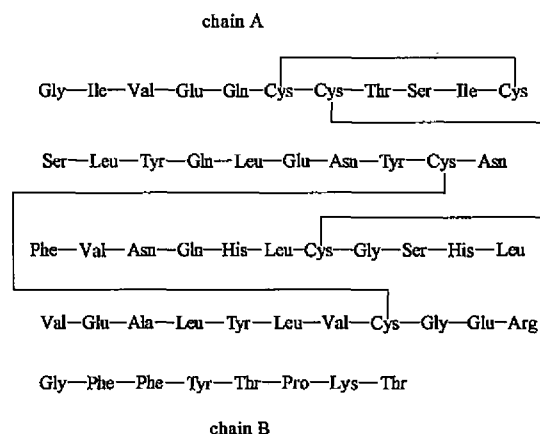

Assay Carry out the biological assay of insulin (Appendix III G), it complies with the related requirements for potency.

Category As described under Insulin.

Strength (1) 10 ml : 400 Units (2) 10 ml : 800 Units

Storage Preserve in well closed containers, stored in a cold place, avoid freezing.

Recombinant Human Insulin

$\text{C}_{257}\text{H}_{383}\text{N}_{65}\text{O}_{77}\text{S}_6$ 5807.69

Recombinant Human Insulin is a protein having 51 amino acid residues and produced by a method based on recombinant DNA technology. The content of human insulin $\text{C}_{257}\text{H}_{383}\text{N}_{65}\text{O}_{77}\text{S}_6$ plus A_{21} desamido human insulin is not less than 95.0% and not more than 105.0%, calculated on the dried basis. By convention, for the purpose of labelling insulin preparations, 0.0347 mg of human insulin is equivalent to 1 IU of insulin.

Host-cell and vector-derived DNA and host-cell derived proteins are potential specific impurities related to the manufacturing process and must be controlled strictly during the manufacturing process, the host cell derived proteins content of human insulin derived from a recombinant DNA process, determined by an appropriate and validated method, is not more than 10 ppm, the host cell or vector derived DNA content and limit of human insulin derived from a recombinant DNA process that utilizes prokaryotic or eukaryotic host cells are determined by a validated method.

Description A white or almost white crystalline powder. Practicably insoluble in water, ethanol or ether; freely soluble in dilute hydrochloric acid solution or dilute sodium hydroxide solution.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of recombinant human insulin RS.

(2) Dissolve a quantity substance being examined in 0.1% trifluoroacetic acid solution to produce a solution of 10 mg per ml, measure 20 μ l of above solution, add 20 μ l of 0.2 mol/L trimetamol-hydrochloric acid BS (pH 7.3), 20 μ l of 0.1% V8 enzyme solution and 140 μ l of water, mix well, warm in a water bath at 37°C for 2 hours, then add 3 μ l of phosphoric acid, as test solution. Repeat the operation, using a quantity of recombinant human insulin CRS instead of the substance being examined, as reference solution. Carry out the method for Assay, using a mixture of 0.2 mol/L sulfate BS (pH 2.3) -acetonitrile (90 : 10) as mobile phase A, and a mixture of acetonitrile-water (50 : 50) as mobile

Description It contains a pale yellow to yellow clear oily liquid; odour, slightly alliaceous.

Identification Transfer a few drops of the content of the capsules to a dry test tube, heat gently. It becomes red to brown with the evolution of purplish iodine vapour which turns moistened starch-iodide TP to blue.

Acidity Dissolve 1.0 g in 5 ml of chloroform, add 2 drops of phenolphthalein IS and 0.25 ml of sodium hydroxide (0.1 mol/L) VS, mix well, a pink colour is produced.

Free iodine To 1.0 g of the content add 5 ml of chloroform, mix well, add 10 ml of water and 0.5 g of potassium iodide, shake thoroughly, add 1 ml of starch IS, mix well. If a bluish-violet colour is produced in the aqueous layer, add 0.25 ml of sodium thiosulfate (0.02 mol/L) VS, the colour disappears.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation, equivalent to about 100 mg of iodine, to a conical flask, add 20 ml of ethanolic potassium hydroxide solution (2→10). Reflux at 90°C on a water bath for 1 hour, transfer while hot to a suitable vessel, rinse the condenser and conical flask with a small quantity of hot water, and combine the washings to the same vessel. Cool to the room temperature, add 5 ml of glacial acetic acid, carry out the method for potentiometric titration (Appendix VII A), titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category Iodine replenisher

Strength (1) 10 mg (I) (2) 20 mg (I) (3) 50 mg (I)

Storage Preserve in tightly closed containers, protected from light, stored in a dry, cool and dark place.

Iodine

I 126.90 [7553-56-2]

Iodine contains not less than 99.5% of I.

Description Grayish-black or bluish-black crystals in plate form or lump with a metallic luster; heavy, brittle; odour, characteristic. Volatilizes room temperature.

Freely soluble in ethanol, ether or carbon disulfide; soluble in chloroform; sparingly soluble in carbon tetrachloride; practically insoluble in water; soluble in aqueous solution of potassium iodide or sodium iodide.

Identification (1) Its ethanolic solution or aqueous solution containing potassium iodide or sodium iodide exhibits a reddish-brown colour. It exhibits a purple colour in chloroform. (2) A saturated aqueous solution yields a blue colour in the presence of starch solution. The colour disappears when the solution is boiled and reappears on cooling but does not reappear when boiled for a longer time.

Chlorides and bromides Triturate 1.0 g with 40 ml of water, added in several portions, filter. Add a small quantity of zinc powder to decolourise the solution. To 10 ml of the solution add gradually 5 ml of ammonia TS and 5 ml of silver nitrate TS. Allow to stand for 5 minutes, filter into a 50 ml Nessler cylinder, add water to produce 40 ml. Add dropwise nitric acid until the solution is neutral to litmus TP, add 1 ml of nitric acid and sufficient water to produce 50 ml. Any opalescence produced is not more pronounced than that of a reference solution, prepared by diluting 3.5 ml of

standard sodium chloride solution with water to produce 40 ml, add 1 ml of nitric acid, 1 ml of silver nitrate TS and sufficient water to produce 50 ml (0.014%).

Sulfates Volatilize 1.0 g by heating on a water bath. Wash the residue with 40 ml of water in several portions. Transfer the washings to a 50 ml Nessler cylinder, filter, if necessary. Carry out the limit test for sulfates (Appendix VII B). Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.03%).

Non-volatile matter Heat the substance being examined in an evaporating dish, previously dried to constant weight at 105°C, on a water bath until the iodine is completely volatilized dry to constant weight at 105°C. The residue is not more than 0.05%.

Assay Place 5 ml of 20% potassium iodide solution in a weighing bottle and weigh accurately. Add about 0.4 g of the substance being examined, finely powdered, weigh again accurately and swirl to effect dissolution. Transfer the solution to a conical flask with stopper, add water to produce 50 ml. Add 1 ml of dilute hydrochloric acid and titrate with sodium thiosulfate (0.1 mol/L) VS. Add 2 ml of starch IS when the end point is nearly approached, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category Antiseptics

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation (1) Iodine Glycerol (2) Iodine Tincture

Iodine Glycerol

Iodine Glycerol contains not less than 0.90% (g/ml) and not more than 1.10% (g/ml) of iodine (I).

Formula	Iodine	10 g
	Potassium iodide	10 g
	Water	10 ml
	Glycerol	a sufficient quantity
	To make	1000 ml

Processing Dissolve potassium iodide in water, add iodine with stirring to effect dissolution. Add glycerol to produce 1000 ml and mix well.

Description A reddish-brown viscous liquid with the characteristic odour of iodine.

Identification (1) Dilute 1 ml with water and add sodium thiosulfate TS, the brown colour is discharged. (2) To the solution obtained in the above test add sodium cobaltinitrite TS, a yellow precipitate is produced.

Assay *Iodine* Transfer 20 ml, accurately measured, to a conical flask with stopper, add 100 ml of water and 1 drop of acetic acid. Titrate with sodium thiosulfate (0.1 mol/L) VS until the solution is colourless. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Category As described under Iodine.

Storage Preserve in tightly closed containers, protected from light.

Iodine Tincture

Iodine Tincture contains not less than 1.80% (g/ml) and not more than 2.20% (g/ml) of iodine (I); not less than 1.35% (g/ml) and not more than 1.65% (g/ml) of potassium iodide (KI).

Formula	Iodine	20 g
	Potassium iodide	15 g
	Ethanol	500 ml
	Water	a sufficient quantity
	To make	1000 ml

Processing Dissolve potassium iodide in 20 ml of water, add iodine and ethanol with stirring to effect dissolution. Add sufficient water to produce 1000 ml.

Description A reddish-brown clear liquid with the characteristic odour of iodine and ethanol.

Identification (1) Add 1 drop to a mixture of 1 ml of starch IS and 10 ml of water. A deep blue colour is produced. (2) Evaporate 5 ml on a water bath to dryness, ignite gently to expel all free iodine, dissolve the residue in water. The solution yields the reactions characteristic of potassium salts and iodides (Appendix III).

y I
with stopper, add 1 drop of acetic acid and titrate with sodium thiosulfate (0.1 mol/L) VS until the solution is colourless. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Potassium iodide To the above titrated solution add 2 ml of acetic acid and 0.1 ml of eosin sodium IS, titrate with silver nitrate (0.1 mol/L) VS until the precipitate changes from yellow to rose-red. Subtract the volume (ml) of sodium thiosulfate (0.1 mol/L) VS consumed from the volume (ml) of silver nitrate (0.1 mol/L) VS consumed. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 16.60 mg of KI.

Category As described under Iodine.

Storage Preserve in tightly closed containers, protected from light and stored in cool place.

Compound Iodine Oral Solution

Compound Iodine Oral Solution contains not less than 4.5% and not more than 5.5% of iodine (I), not less than 9.5% and not more than 10.5% of potassium iodide (KI).

Formula	Iodine	50 g
	Potassium iodide	100 g
	Water	a sufficient quantity
	To make	1000 ml

Processing Dissolve iodine and potassium iodide in 100 ml of water, add a quantity of water to produce 1000 ml.

Description A clear, dark brown liquid with an odour characteristic of iodine.

Identification (1) Add 1 drop to a mixture of 1 ml of starch IS and 10 ml of water, a deep blue colour is produced. (2) Evaporate 5 ml to dryness on a water bath, ignite gently until free iodine is expelled completely. Dissolve the residue

in water, the resulting solution yields the reactions characteristic of potassium salts and iodides (Appendix III).

other requirements Complies with the general requirements for oral solutions (Appendix I O).

Assay Iodine Measure accurately 15 ml to a 50 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 10 ml of the resulting solution to a conical flask with stopper, add 1 drop of acetic acid, titrate with sodium thiosulfate (0.1 mol/L) VS until the solution becomes colourless. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.69 mg of I.

Potassium iodide To the above titrated solution add 2 ml of acetic acid and 0.5 ml of eosin sodium IS. Titrate with silver nitrate (0.1 mol/L) VS until the precipitate changes from yellow to rose-red. Subtract the volume (ml) of sodium thiosulfate (0.1 mol/L) VS consumed from the volume (ml) of silver nitrate (0.1 mol/L) VS consumed. Each ml of silver nitrate (0.1 mol/L) is equivalent to 16.60 mg of KI.

Iopanoic Acid

$C_{11}H_{12}I_3NO_2$ 570.93

[96-83-3]

Iopanoic Acid is α -ethyl- β -(3-amino-2, 4, 6-triiodophenyl) propanoic acid. It contains not less than 98.5% of $C_{11}H_{12}I_3NO_2$, calculated on the dried basis.

Description An almost white to slightly red powder; odourless; tasteless.

Soluble in ethanol or acetone; sparingly soluble in chloroform; practically insoluble in water; freely soluble in sodium hydroxide solution.

Melting range 152-158°C, with decomposition (Appendix VI C).

Identification (1) Heat 10 mg in a crucible gently; violet vapours of iodine are evolved.

(2) To about 20 mg add 0.2 ml of hydrochloric acid and heat gently until one drop is left. Cool to room temperature, add 0.2 ml of 0.1 mol/L sodium nitrite solution and allow to stand for several minutes. Add 2 ml of sodium carbonate TS and 20 mg of resorcinol; an orange red colour is produced.

(3) The light absorption of a solution of 10 μ g per ml in 0.04% sodium hydroxide solution exhibits a maximum at 230 nm; the absorbance is about 0.70 (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of iopanoic acid (Appendix XVI).

Halides Dissolve 1.0 g in 3 ml of sodium hydroxide TS, add 10 ml of water, add 3 ml of nitric acid solution (1→2) dropwise, shake, filter and wash the residue with a quantity of water. Combine the filtrate and washings in a 50 ml Nessler cylinder, add water to produce 40 ml. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence

produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.007%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Reflux about 0.3 g, accurately weighed, with 30 ml of sodium hydroxide TS and 1 g of zinc powder for 30 minutes. Cool, rinse the condenser with a small quantity of water, filter, wash the flask and filter with three quantities of water, each of 15 ml. To the combined filtrate and washings, add 5 ml of glacial acetic acid and 1 ml of eosin sodium IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.

Category Diagnostic agent

Storage Preserve in tightly closed containers, protected from light.

Preparation Iopanoic Acid Tablets

Iopanoic Acid Tablets

Iopanoic Acid Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of iopanoic acid ($C_{11}H_{12}I_3NO_2$).

Description Almost white to slightly red tablets.

Identification Stir a quantity of finely powdered tablets equivalent to about 0.1 g of iopanoic acid with 4 ml of chloroform to dissolve iopanoic acid, filter and evaporate to dryness; the residue complies with tests (1) and (2) for Identification described under Iopanoic Acid.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Carry out the Assay described under Iopanoic Acid using an accurately weighed quantity of powdered tablets, equivalent to about 0.25 g of iopanoic acid. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.

Category As described under Iopanoic Acid.

Strength 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Iophendylate

$C_{19}H_{29}IO_2$ 416.34

[1320-11-2]

Iophendylate is a mixture of isomers of ethyl iodophenylundecanoate, consisting mainly of ethyl 10-(4-iodophenyl) undecanoate. It contains not less than 97.0% of $C_{19}H_{29}IO_2$.

Description A colourless to pale yellow, viscous oily liquid; odour, faintly estereal.

Very soluble in ethanol, chloroform or ether; insoluble in

water.

Relative density 1.248-1.260 (Appendix VI A).

Refractive index 1.525-1.527 (Appendix VI F).

Saponification value 132-142 (Appendix VII H).

Identification To 1 ml add 15 ml of water and 7 g of potassium dichromate, then add cautiously and slowly 10 ml of sulfuric acid while cooling in a water bath. When the reaction has subsided, reflux the mixture on a water bath for 2 hours. Pour the cooled contents into 25 ml of water, filter and wash the precipitate with water and dry. Sublime the dried precipitate; white needle crystals are produced.

Acidity Dissolve 1.0 ml in 10 ml of neutralized ethanol (neutral to phenolphthalein IS), add 3 drops of phenolphthalein IS; the solution turns to red on addition of not more than 0.25 ml of sodium hydroxide (0.1 mol/L) VS.

Free iodine Shake 1.0 ml with 5 ml of chloroform, 10 ml of potassium iodide TS and 1 ml of starch IS; no blue or violet colour is produced in aqueous layer.

Iodine attached to the straight chain Reflux 0.50 g with 10 ml of ethanolic potassium hydroxide (1 mol/L) VS on a water bath for 1 hour. Add 40 ml of water and 5 ml of sulfuric acid (1→2), cool to room temperature and filter. Wash the precipitate with 10 ml of water, combine the filtrate and washing. Add 1-2 drops of potassium permanganate solution (1→10000) and 1 ml of starch IS. If a blue colour is produced, titrate with silver nitrate (0.1 mol/L) VS until the blue colour disappears; not more than 0.20 ml of silver nitrate (0.1 mol/L) VS is consumed.

Assay Carry out the method for oxygen flask combustion (Appendix VII C), using about 20 mg, accurately weighed, use a mixture of 2 ml of sodium hydroxide TS and 10 ml of water as the absorbing liquid. After the completion of combustion, add 10 ml of bromine-acetic acid solution (dissolve 10 g of potassium acetate in a quantity of glacial acetic acid, add 0.4 ml of bromine and sufficient glacial acetic acid to produce 100 ml). Stopper the flask, shake and allow to stand for several minutes. Add about 1 ml of formic acid and rinse the mouth of the flask with water. Sweep off any bromine vapour with a current of air. Add 2 g of potassium iodide, stopper the flask and mix well, then titrate with sodium thiosulfate (0.02 mol/L) VS. Add starch IS when the end point is nearly approached, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.02 mol/L) VS is equivalent to 1.388 mg of $C_{19}H_{29}IO_2$.

Category Diagnostic agent

Storage Preserve in tightly closed containers, protected from light.

Preparation Iophendylate Injection

Iophendylate Injection

Iophendylate Injection is a sterile preparation of iophendylate. It contains not less than 97.0% of iophendylate ($C_{19}H_{29}IO_2$).

Description A colourless to pale yellow, viscous oily liquid.

Identification Complies with the test for Identification described under Iophendylate.

Acidity and Free iodine Complies with the tests described under Iophendylate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay As described under Iophendylate.

Category As described under Iophendylate.

Strength (1) 2 ml (2) 3 ml (3) 5 ml

Storage Preserve in well closed containers, protected from light.

Iotalamic Acid

$C_{11}H_9I_3N_2O_4$ 613.92

[2276-90-6]

Iotalamic Acid is 3-(acetamino)-5-[(methylamino) carbonyl]-2, 4, 6-triiodobenzoic acid. It contains not less than 98.5% of $C_{11}H_9I_3N_2O_4$, calculated on the dried basis.

Description A white, crystalline powder; odourless; tasteless. Slightly soluble in water or ethanol; insoluble in chloroform; easily soluble in alkaline hydroxide solutions.

Identification (1) Heat gently about 10 mg in a crucible, violet iodine vapour is produced with decomposition. (2) The infrared absorption spectrum (spectrum IV C) is concordant with the reference spectrum of iotalamic acid (Appendix XVI).

Chlorides Dissolve 0.5 g in 20 ml of water and a few drops of ammonia TS, add in dropwise of 1.5 ml of nitric acid with stirring to precipitate iotalamic acid. Filter, wash the precipitate with a small quantity of water. Combine the filtrate and washings in a Nessler cylinder, add water to a volume of 40 ml. Carry out the limit test for chlorides (Appendix VII A), any opalescence produced is not more pronounced than that of a reference using 2.5 ml of sodium chloride standard solution (0.005%).

Free iodine Dissolve 0.20 g in 2.0 ml of sodium hydroxide TS, add 2.5 ml of dilute sulfuric acid to precipitate iotalamic acid. Allow it to stand for 10 minutes, shake on adding 5 ml of chloroform, no colour is produced in chloroform layer.

Amino compound Dissolve 1.25 g in a mixture of 5 ml of water and 5 ml of sodium hydroxide TS, dilute with water to 100 ml and shake well. To 10 ml of the solution add 5 ml of 0.1 mol/L sodium nitrite and 10 ml of hydrochloric acid solution (9 → 100), shake well, allow to stand for 10 minutes, add 5 ml of 2.5% ammonium sulfamate solution shake well and allow the reaction mixture to stand for 5 minutes. Add 2 ml of alkaline β -naphthol TS, 15 ml of sodium hydroxide TS and water to a volume of 50 ml and shake well. Measure the absorbance of the resulting solution at 485 nm (Appendix IV A); not more than 0.25.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in

Residue on ignition; not more than 0.001%.

Assay Heat under reflux about 0.4 g, accurately weighed, with 30 ml of sodium hydroxide TS and 1.0 g of zinc powder for 30 minutes. Cool, wash the condenser with a small amount of water. Filter, wash the flask and the filter with water for 3 times, each of 15 ml. Combine the filtrate and washings, add 5 ml of glacial acetic acid and 5 drops of eosin sodium IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 20.46 mg of $C_{11}H_9I_3N_2O_4$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Meglumine Iotalamate Injection

Meglumine Iotalamate Injection

Meglumine Iotalamate Injection is a sterile solution of equivalent molecular amount of iotalamic acid and meglumine in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of meglumine iotalamate ($C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$).

Description A clear, colourless to pale yellow, liquid.

Identification (1) Evaporate about 1 ml to dryness, heat the residue gently, a violet vapour of iodine is produced. (2) To about 0.1 ml add 1 ml of ferric chloride TS and 2 ml of 20% sodium hydroxide solution in dropwise, a brownish-red precipitate is produced which is dissolved to produce a brownish-red solution. (3) Stir well 4 ml with 40 ml of water and 5 ml of dilute hydrochloric acid, a white precipitate is produced. Filter, wash the residue with 2 quantities of 10 ml of water and dry it at 105°C for 4 hours. Its infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of iotalamic acid (Appendix XVI).

pH value 6.0-8.0 (Appendix VI H).

Colour Not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Iodide Carry out the test for Iodide described under Sodium Diatrizoate Injection, using a quantity equivalent to about 1.0 g of meglumine iotalamate. It complies with the requirements.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 3 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirement for injections (Appendix I B).

Assay Dilute a quantity equivalent to about 6 g of meglumine iotalamate to volume with water in 100 ml volumetric flask, and shake well. Carry out the Assay described under diatrizoic acid, beginning at the words "add 30 ml of sodium hydroxide TS and 1.0 g of powdered zinc", using 10 ml accurately measured, of injection. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 26.97 mg of $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$.

Category Diagnostic agent.

Strength (1) 1 ml : 0.125 g (2) 10 ml : 6 g
(3) 20 ml : 12 g (4) 50 ml : 30 g
(5) 100 ml : 60 g

Storage Preserve in well closed containers, protected from

light.

Iron Dextran

Iron Dextran is a complex compound of ferric hydroxide with dextran of weight average molecular mass between 5000 and 7500. It contains not less than 25.0% of iron, calculated on the dried basis.

Description A dark brown to brown black crystalline powder, odourless.

Sparingly soluble in hot water; insoluble in ethanol.

Identification (1) Dissolve about 40 mg in 5 ml of water by heating, cool to room temperature, add ammonia TS, no precipitate is produced. To about 80 mg add 20 ml of water and 5 ml of hydrochloric acid, heat to boiling for 5 minutes, cool to room temperature, add excessive ammonia TS, a red brown precipitate is produced, filter, wash the precipitate with water, add a quantity of hydrochloric acid to dissolve, add water to 20 ml, the solution yields the reactions characteristic of iron (Appendix III).

(2) Dissolve about 40 mg in 500 ml of water by heating, transfer 1 ml to a tube, add 2 ml of anthrone solution (dissolve 0.4 g of anthrone in a mixture of 10 ml of water and 190 ml of sulfuric acid) along the wall of the tube in an ice bath, mix well and heat, the colour changes from green to blue green.

Free iron Weigh about 0.10 g substance being examined in a 50 ml of Nessler cylinder, in 10 ml of water, shake to dissolve, add 1.0 ml of iron standard stock solution and 15 ml of potassium thiocyanate solution (dissolve 15 g of potassium thiocyanate in 50 ml of water in a 100 ml volumetric flask, add 50 ml of water and 15 ml of acetone, dilute with water to volume and mix well) and 24 ml of acetone mix well, allow to stand and examine the colour of the supernatant. Any colour produced is not more intense than that of a reference solution using 3.0 ml of iron standard stock solution (0.2%).

Chlorides To 0.25 g add 2 ml of water and 1 ml of sulfuric acid, heat until the solution turns to pale yellow, cool to room temperature, dilute with water to 200 ml. Carry out the limit test for chlorides (Appendix VIII A), using 2 ml. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (2.0%).

Molecular weight and molecular weight distribution Weigh a quantity of substance being examined, equivalent to 40 mg iron dextran, in a test tube, add 2 ml of water, heat to dissolve, cool to room temperature, add 1 ml of 4 mol/L sodium dihydrogen phosphate, mix well, standing over night, add mobile phase to 10 ml, filter, using the successive filtrate as the test solution. Repeat the preparation, using 4 to 5 of dextran CRS with known molecular mass, as the reference solutions. Carry out the method for size exclusion chromatography (Appendix H), using a specific gel column for polysaccharides, and 0.71% sodium sulfate solution containing 0.02% sodium azide as the mobile phase and a differential refractometer as detector. The column temperature is at 35°C and flow rate is 0.5 ml per minute. Dissolve separately a quantity of glucose and blue dextran 2000 in mobile phase to produce a solution containing about 10 mg per ml. Inject 20 µl into the column, record the retention time t_r and t_0 . The retention times obtained from chromatogram of the test solution and the reference solution are all between t_r and t_0 . The number of the theoretical plates of the column is not less than 5000, calculated with reference the peak of glucose. Inject 20 µl of the reference

solutions and 50 µl of the test solution separately into the column, record the chromatogram. The data is processed by special software for GPC. Distribution coefficient D (M_w/M_n) is not more than 2.0.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Heavy metals To 1.0 g add 6 ml of water and 4 ml of nitric acid, heat in a water bath until the volume is about 2-3 ml, cool, add 2 ml of sulfuric acid, heat in a water bath until the solution changes to white powder entirely, if not, add 1-2 ml of nitric acid again, heat in a water bath, cool, add 15 ml of hydrochloric acid, heat to dissolve, extract with four 8 ml portions of isobutyl acetate, discard organic layers, evaporate the combined aqueous layers on a water bath to 8 ml, cool, add 1 drop of phenolphthalein IS, neutralize with ammonia TS, add 2 ml of acetate BS (pH 3.5), add water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Arsenic To 0.4 g add 0.5 g of calcium hydroxide, mix well, ignite slowly until thoroughly charred, ignite again at 500-600°C until the incineration is complete, cool to room temperature, add 14 ml of hydrochloric acid and 7 ml of water to dissolve, transfer to a distillator, add 0.5 ml of acidic stannous chloride TS, distill to about 5 ml, introduce the distillate to a bottle for Arsenic containing 10 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0005%.

Assay Measure accurately about 0.3 g to a conical flask with stopper, add 34 ml of water and 2 ml of sulfuric acid, heat until the solution turns to orange yellow, cool to room temperature, add potassium permanganate TS dropwise just until a pink colour is produced and persist for 5 seconds, add 30 ml of hydrochloric acid and 30 ml of potassium iodide TS, stopper tightly, allow to stand for 3 minutes, add 50 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Each ml of sodium thiofulfate (0.1 mol/L) VS is equivalent to 5.585 mg of iron (Fe).

Category Antiexsanguine

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Iron Dextran Injection
(2) Iron Dextran Tablets

Iron Dextran Injection

Iron Dextran Injection is a sterile colloidal solution of iron dextran. It contains not less than 95.0% and not more than 105.0% of the labelled amount of iron (Fe).

Description A dark brown colloidal solution.

Identification (1) Dilute 0.5 ml with 5 ml of water, the solution complies with test (1) for Identification described under Iron Dextran.

(2) Dilute 1 ml to 1000 ml with water, the solution complies with test (2) for Identification described under Iron Dextran.

pH value 5.2~6.5 (Appendix VI H).

Chlorides Carry out the test for Chlorides described under Iron Dextran, using 1 ml. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.5%).

Molecular weight and weight distribution Measure a quantity, equivalent to 5.0 mg iron, add 1 ml of 4 mol/L sodium dihydrogen phosphate, mix well, standing over night, add water to 10 ml, filter. Inject 5 μ l of the successive filtrate into the column, carry out the method described under Iron Dextran, the weight average molecular weight (Mw) of dextran is about 5000 to 7500, and the molecular weight distribution coefficient D (Mw/Mn) is not less than 2.0.

Heavy metals Carry out the test for Heavy metals described under Iron Dextran, using 2 ml, not more than 0.0015%.

Arsenic Carry out the test for Arsenic described under Iron Dextran, using 1 ml, not more than 0.0002%.

Iron absorption in the injection site *preparation of test solution and reference solution* Using two healthy rabbits, each weighing between 1.5 kg and 2.5 kg, clip the legs free from hair over the inner sites and swab the area with a bactericidal solution. Use one leg of each rabbit for injecting substance being examined, and the other leg for reference. Inject each site with a dose of 0.4 ml (for the strength of 25 mg of iron per ml) or 0.2 ml (for the strength of 50 mg of iron per ml) per kg of body weight in the following manner. Insert the needle in the distal end of the semitendinosus muscle, passing through the sartorius and entering the vastus medialis. Seven days after the injection, sacrifice the rabbits, carefully dissect the coloured vastus medialis of the site of injection. Homogenize the flesh and transfer the homogenized paste to a 1000 ml beaker, add 75 ml of 2 mol/L sodium hydroxide solution and sufficient water over the flesh, cover the beaker with a lid and boil until no solid matter exists, cool, cautiously add 50 ml of sulfuric acid, heat the mixture till boiling and add about 10 ml of nitric acid dropwise in several portions until no charring occurs, heat until the excess of nitric acid is boiled off, cool, transfer to a 250 ml volumetric flask, add water to volume. Use this solution as the test solution. Repeat the operation, beginning at the word "carefully dissect...", using the same site and equal amount of the vastus medialis from the reference leg as the reference solution.

Calibration curve Transfer separately 0 ml, 0.5 ml, 1.0 ml, 2.0 ml and 3.0 ml of iron standard stock solution (containing 100 μ g of iron per ml), accurately measured, to each 100 ml volumetric flask, add 10 ml of 20% citric acid solution and 1 ml of thioglycollic acid respectively, mix well, add strong ammonia solution dropwise until the purplish-red colour is fully developed, dilute with water to volume. Measure the absorbance at 530 nm (Appendix IV A), using the solution obtained with 0 ml of the iron standard stock solution as a blank solution. A regression equation is obtained with the amount of iron versus the corresponding absorbance.

Procedure To 5.0 ml of the test solution, accurately measured, add 3 ml of sulfuric acid, heat till fuming, add a quantity of nitric acid, continue heating until the solution turns to colourless, cool, add 20 ml of water, boil for 3 minutes, cool, add 10 ml of 20% citric acid solution and 1 ml of thioglycollic acid, add strong ammonia solution dropwise until the purplish-red colour is fully developed. Transfer to a 100 ml volumetric flask, dilute with water to volume. Use this solution as a test solution to be determined. Measure the absorbance (A_T) at 530 nm (Appendix IV A), using the solution obtained with 0 ml of the iron standard stock solution described under calibration curve as a blank solution. Calculate the amount of iron (Fe_T) from the regression equation. Repeat the operation, using the reference solution instead of the test solution, calculate the amount of iron (Fe_R) from the regression equation.

The content of iron in injection site (%)

$$= \frac{Fe_T - Fe_R}{\text{The amount of iron injected}} \times 50 \times 100\%$$

The content of unabsorbed iron: not more than 20%

Iron Dextran Tablets

Iron Dextran Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of iron dextran, calculated on iron.

Description Sugar coated tablets with dark brown core.

Identification A quantity of the powdered tablets equivalent to about 12.5 mg of iron complies with tests (1) and (2) for Identification described under Iron Dextran.

Free iron Comply with the requirements described under Iron Dextran (0.2%), using 10 tablets.

Other requirements Comply with the general requirements for Tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with sugar coating removed. Weigh accurately a quantity equivalent to about 100 mg of iron, carry out the Assay described under Iron Dextran.

Category, Storage As described under Iron Dextran.

Strength 25 mg (iron)

Isocarboxazid

$C_{12}H_{13}N_3O_2$ 231.25

[59-63-2]

Isocarboxazid is 5-methyl-3-isoxazolecarboxylic acid 2-benzylhydrazide. It contains not less than 98.5% of $C_{12}H_{13}N_3O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odour, slightly characteristic. Very soluble in chloroform; soluble in ethanol; slightly soluble in water.

Melting point 105-108°C (Appendix VI C).

Identification (1) Dissolve about 10 mg in 10 ml of acetone, add 0.2 ml each of water and 1% solution of ammonium molybdate in dilute hydrochloric acid, an orange colour is produced.

(2) Dissolve about 15 mg in ethanol, add 1 ml of 0.1% ethanolic p-dimethylaminobenzaldehyde solution, a yellow colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of isocarboxazid CRS.

Chloride To 0.1 g add 3 ml of 30% hydrogen peroxide solution, 5 ml of 2 mol/L sodium hydroxide solution and 7 ml of water, heat to boil for 2 minutes, allow to cool, add water to produce 40 ml, add dropwise dilute nitric acid to neutralize the solution. Carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference solution using 2 ml of sodium chloride standard solution (0.02%).

Related substances Dissolve a quantity in methanol to produce a solution of 50 mg per ml as test solution. Transfer

12.5 mg of methyl 5-methyl-3-isoxazolecarboxylate CRS to 50 ml volumetric flask, add methanol to dissolve and dilute to volume, mix well, use the solution as reference solution (1). Dissolve 12.5 mg of 1-benzyl-3-methyl-5-aminopyrazole CRS in 50 ml of methanol, add 1 g of sodium carbonate, shake thoroughly for 2 minutes and filter, use the filtrate as reference solution (2). Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-*n*-heptane (3 : 2) as the mobile phase. Apply separately to the same plate 20 µl each of above three solutions, after developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution (1) (0.5%). Spray with a mixture of ferric chloride-potassium ferricyanide (mix 20 ml of 10% ferric chloride solution and 20 ml of 20% potassium ferricyanide solution, freshly prepared). Any spot in the chromatogram other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution (2) (0.5%).

Loss on drying When dried in vacuum at 60°C for 4 hours, loses not more than 0.3 % of its weight (Appendix VII L).

Residue on ignition Not more than 0.1 % (Appendix VIII N).

Assay Dissolve about 0.5 g, accurately weighed, in 20 ml of glacial acetic acid, add 10 ml of hydrochloric acid and 40 ml of water. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 23.13 mg of C₁₂H₁₃N₃O₂.

Category Antidepressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Isocarboxazid Tablets

Isocarboxazid Tablets

Isocarboxazid Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of isocarboxazid (C₁₂H₁₃N₃O₂).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 10 mg of isocarboxazid, add 5 ml of acetone to dissolve isocarboxazid and filter. Add 4 drops of water and 4 drops of a solution of 1% ammonium molybdate in dilute hydrochloric acid to the filtrate, an orange colour is produced.

(2) To a quantity of the powdered tablets equivalent to about 10 mg of isocarboxazid, add 5 ml of ethanol to dissolve isocarboxazid and filter. Add 1 ml of a solution of 1% dimethylaminobenzaldehyde in ethanol (contain 1% hydrochloric acid), a yellow colour is produced.

Content uniformity Comply with the requirements (Appendix X E). Take 1 tablet in a 100 ml volumetric flask with a quantity of phosphate BS (pH 7.6), shake to dissolve isocarboxazid and dilute to volume with the same solvent, mix well and filter, measure accurately 5 ml of the successive filtrate in a 50 ml volumetric flask, dilute with phosphate BS (pH 7.6) to volume, mix well, use as the test solution. Dissolve a quantity of isocarboxazid CRS, accurately weighed, in phosphate BS (pH 7.6) to produce a solution of 10 µg per ml as reference solution. Measure the

absorbance of the resulting solutions at 232 nm (Appendix IV A), calculate the content of C₁₂H₁₃N₃O₂.

Dissolution Comply with the dissolution test (Appendix X C, method 2), using 900 ml of phosphate BS (pH 7.6) as the dissolution medium, adjust the rotational speed of paddle to 100 rpm. Withdraw the solution at 45 exact minutes and filter, use the successive filtrate as the test preparation. Dissolve a quantity of isocarboxazid CRS, in phosphate BS (pH 7.6) to produce a solution of 10 µg per ml as reference preparation. Measure the absorbances of the resulting solutions at 232 nm (Appendix IV A). Calculate the dissolution of C₁₂H₁₃N₃O₂ from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 80 tablets. Dissolve a quantity of the powdered tablets equivalent to about 0.35 g of isocarboxazid, accurately weighed, in 20 ml of glacial acetic acid, add 10 ml of hydrochloric acid and 40 ml of water. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 23.13 mg of C₁₂H₁₃N₃O₂.

Category As described under Isocarboxazid.

Strength 10 mg

Storage Preserve in tightly closed containers, protected from light.

Isoleucine

C₆H₁₃NO₂ 131.17

[73-32-5]

Isoleucine is (L)-2-amino-3-methylpentanoic acid. It contains not less than 98.5% of C₆H₁₃NO₂, calculated on the dried basis.

Description White crystals or a white crystalline powder; odourless; taste, slightly bitter. Sparingly soluble in water; practically insoluble in ethanol or ether.

Specific optical rotation +38.9° to +41.8°, in a solution of 40 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of isoleucine (Appendix XVI).

Acidity Dissolve 0.20 g in 20 ml of water, pH 5.5-6.5 (Appendix VI H).

Transmittance of solution Dissolve 0.5 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorides Carry out the limit test for chlorides (Appendix VII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of

potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-water-glacial acetic acid (3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions of the substance being examined in water containing (1) 4 mg per ml, (2) 20 μ g per ml. After developing and removal of the plate, dry in air and spray with ninhydrin solution (dissolve 1 g of ninhydrin in 50 ml of acetone) and heat at 80°C until the colour is produced and examine immediately. Any spot other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%, using 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.001%.

Arsenic Dissolve 2.0 g in 5 ml of water, add 1 ml of sulfuric acid and 10 ml of sulfite acid. evaporate to about 2 ml on a water bath, add 5 ml of water and add dropwise ammonia TS until phenolphthalein IS change the colour. Add 5 ml of hydrochloric acid and sufficient water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 20 EU per g of isoleucine (for injection).

Assay Dissolve about 0.10 g, accurately weighed, in 1 ml of dehydrated formic acid. Add 25 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.12 mg of $C_6H_7N_3O$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Isoniazid

$C_6H_7N_3O$ 137.14

[54-85-3]

Isoniazid is 4-pyridinecarboxylic acid hydrazide. It contains not less than 99.0% of $C_6H_7N_3O$, calculated on the dried basis.

Description Colourless crystals or a white or almost white crystalline powder; odourless; taste, slightly sweet at first and then bitter; deteriorates gradually on exposure to light. Freely soluble in water; slightly soluble in ethanol; very slightly soluble in ether.

Melting point 170-173°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 1 ml of 10% solution of vanillin in ethanol, mix well, heat gently, cool to room temperature, yellow crystals are produced; filter, recrystallize with dilute ethanol. The crystals, after drying at 105°C, melt at 228-231°C, with decomposition (Appendix VI C).

(2) Dissolve about 10 mg in 2 ml of water in a test tube, add 1 ml of ammoniated silver nitrate TS, bubbles and a black turbidity are produced immediately, and a silver mirror is formed on the wall of the tube.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of isoniazid (Appendix XVI).

Acidity or alkalinity Dissolve 0.50 g in 10 ml of water, pH 6.0-8.0 (Appendix VI H).

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and colourless. Any opalescence is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than equal volume of reference solution (mix 3.0 ml of standard potassium chromate CS and standard copper sulfate CS, add water to produce 250 ml).

Free hydrazine Prepare a solution of 50 mg per ml in water as the test solution, and a solution of hydrazine sulfate CRS of 0.20 mg (equivalent to 50 μ g of free hydrazine) per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance, and a mixture of isopropyl alcohol-acetone (3 : 2) as the mobile phase. Apply separately to the plate 10 μ l of the test solution and 2 μ l of the reference solution. After developing and removal of the plate, dry it in air, spray with 4-dimethylamino-benzaldehyde TS and allow to stand for 15 minutes. No yellow spot corresponding to the hydrazine sulfate spot in the chromatogram is obtained with the test solution.

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals, using the residue obtained in the test for Residue on ignition (Appendix VIII H, method 2): not more than 0.001%.

Sterility Complies with the test for sterility (Appendix XI H) (for injection).

Assay Dissolve about 0.2 g, accurately weighed, in water in a 100 ml volumetric flask, add water to volume, mix well. Measure accurately 25 ml, add 50 ml of water, 20 ml of hydrochloric acid and 1 drop of ethoxychrysoidine IS. Titrate slowly, at a temperature of 18-25°C, with potassium bismuthate (0.01667 mol/L) VS. Each ml of potassium bromate (0.01667 mol/L) VS is equivalent to 3.429 mg of $C_6H_7N_3O$.

Category Antituberculous.

Storage Preserve in hermetically sealed containers, protected from light.

Preparation (1) Isoniazid for Injection
(2) Isoniazid Tablets

Isoniazid for Injection

Isoniazid for Injection is a sterile powder of isoniazid. It contains not less than 95.0% and not more

than 105.0% of the labelled amount of isoniazid ($C_6H_7N_3O$), calculated on the basis of average content.

Description Colourless crystals a white or almost white crystalline powder.

Identification Complies with tests for Identification described under Isoniazid.

Colour of solution Dissolve the contents of 5 containers in 10 ml of water. Any colour produced is not more intense than equal volume of a reference solution (3.0 ml of standard potassium dichromate CS and 0.10 ml of standard copper sulfate CS, dilute to 250 ml with water).

Acidity or alkalinity, Free hydrazine Complies with the test described under Isoniazid.

Loss on drying When dried at 105°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Sterility Dissolve the contents of each of containers in sterile water separately to produce solutions of 20 mg per ml, the solutions comply with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Isoniazid, using about 0.2 g, accurately weighed, of the mixed contents obtained in the test for weight variation. Each ml of potassium bromate (0.01667 mol/L) VS is equivalent to 3.429 mg of $C_6H_7N_3O$.

Category As described under Isoniazid.

Strength 0.1 g

Storage Preserve in well closed containers, protected from light.

Isoniazid Tablets

Isoniazid Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of isoniazid ($C_6H_7N_3O$).

Description White tablets.

Identification Shake a quantity of the powdered tablets equivalent to about 0.1 g of isoniazid with 10 ml of water, filter. The filtrate complies with test (2) for Identification described under Isoniazid.

Dissolution Carry out the method for dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 5 ml of the solution at 30 exact minutes and filter. To a quantity of the successive filtrate, measured accurately, add water to produce a solution of 10–20 µg per ml. Measure the absorbance of the solution at 263 nm (Appendix IV A), taking 307 as the value of A (1%, 1 cm). Calculate the dissolution of $C_6H_7N_3O$ from each tablet, not less than 60% of the labelled amount is dissolved.

Other requirements Comply with general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve a quantity of the powdered tablets equivalent to about 0.2 g of isoniazid, accurately weighed, in a quantity of water in a 100 ml volumetric flask with shaking, add water to volume, mix well and filter. Carry out the Assay described under

Isoniazid, using accurately 25 ml of the successive filtrate, beginning at the words "add 50 ml of water, 20 ml of hydrochloric acid...". Each ml of potassium bromate (0.01667 mol/L) VS is equivalent to 3.429 mg of $C_6H_7N_3O$.

Category As described under Isoniazid.

Strength (1) 50 mg (2) 100 mg (3) 300 mg

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Isophane Protamine Recombinant Human Insulin Injection

Isophane Protamine Recombinant Human Insulin Injection is a sterile suspension of recombinant human insulin and protamine containing antiseptic agent. It has a potency of not less than 90.0% and not more than 110.0% of the labelled potency of recombinant human insulin and contains not less than 80% and not more than 110% of the labelled amount of antiseptic agent.

Description A white or almost white suspension; dispersed uniformly on shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum diameter greater than 1 µm, but rarely exceeding 60 µm, free from aggregates.

Identification To each ml add 3 µl of 9.6 mol/L hydrochloric acid solution to obtain a clear solution, which complies with test (1) for Identification described under Recombinant Human Insulin.

pH value 6.9–7.8 (Appendix VI H).

Related proteins To each ml add 3 µl of 9.6 mol/L hydrochloric acid solution as a test solution, measure 50 µl and carry out the test for Related proteins described under Recombinant human insulin, the total related proteins are not more than 8.0%.

High molecular weight proteins To each ml add 3 µl of 9.6 mol/L hydrochloric acid solution as the test solution, measure 100 µl and carry out the test for High molecular weight proteins described under Recombinant human insulin. The percentage of high molecular weight proteins is not more than 3.0%.

Zinc Measure accurately a quantity equivalent to about 16 µg of zinc to a 10 ml volumetric flask, add 2 ml of boric acid potassium chloride BS (pH 9.0) and 0.4 ml of 0.01 mol/L hydrochloric acid solution containing 250 Units of trypsin per ml, allow to stand for 10 minutes, and then add 1 ml of zincous solution described under Recombinant Human Insulin; not less than 10 µg and not more than 40 µg of Zn per 100 Units of recombinant human insulin.

Recombinant human insulin in the supernatant Measure accurately 10 ml, centrifuge at the speed of 1500 g for 10 minutes, using the supernatant as the test solution. Measure accurately 1.0 ml of the reference solution of recombinant human insulin described under Assay to a 10 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume, as the reference solution. Carry out the Assay described under Recombinant Human Insulin; not more than 2.5% of recombinant human insulin in supernatant.

Phenol or m-cresol Complies with the test for Phenol or m-cresol described under Recombinant Human Insulin Injection,

using the test solution obtained in test for Recombinant human insulin in the supernatant.

Sterility Complies with the test for sterility (Appendix IX H, membrane filtration method), using a clear solution prepared by mixing the content of each container with 90 ml of sterilized 1% aqueous ascorbic acid solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 2.5 EU per Unit of recombinant human insulin.

Other requirements Complies with the general requirements for injections (Appendix I B) except visible particles.

Assay Measure accurately a quantity, add 3 μ l of 9.6 mol/L hydrochloric acid solution per ml to obtain a clear solution. Dilute an accurately measured quantity with 0.01 mol/L hydrochloric acid solution to produce a solution of 10 Units per ml, carry out the Assay described under Recombinant Human Insulin.

Category As described under Recombinant Human Insulin.

Strength (1) 3 ml : 300 Units (2) 10 ml : 400 Units

Storage Preserve in tightly closed containers, stored in a cold place, avoid freezing.

Isoprenaline Hydrochloride

$C_{11}H_{17}NO_3 \cdot HCl$ 247.72

[51-30-9]

Isoprenaline Hydrochloride is 4- [1-hydroxyl-2-(1-methylethyl) amino]-1, 2-benzenediol hydrochloride. It contains not less than 98.5% of $C_{11}H_{17}NO_3 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter. Discoloured slowly on exposure to light and air, especially in alkali solution. Freely soluble in water; sparingly soluble in ethanol; insoluble in chloroform or ether.

Melting range 165.5-170°C, with decomposition (Appendix VI C).

Identification (1) Dissolve 20 mg in 2 ml of water, add 2 drops of ferric chloride TS; a deep green colour is produced, changing to blue and then to red on addition of a dropwise freshly prepared 5% sodium bicarbonate solution.

(2) Dissolve 10 mg in 10 ml of water. To 2 ml, add 0.1 ml of hydrochloric acid (0.1 mol/L) VS and 1 ml of 0.1 mol/L iodine solution, allow to stand for 5 minutes, then add 4 ml of 0.1 mol/L sodium thiosulfate solution; a pale red colour develops.

(3) A solution of 0.05 mg per ml in water only exhibits a maximum at 280 nm; the absorbance is about 0.50 (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of isoprenaline hydrochloride (Appendix XVI).

(5) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.5-5.5 (Appendix VI H).

Ketonic substance The absorbance of a solution of 2.0 mg per ml in water at 310 nm (Appendix IV A) is not greater than 0.15.

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.15 g, accurately weighed, in 30 ml of glacial acetic acid by warming, cool to room temperature, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.77 mg of $C_{11}H_{17}NO_3 \cdot HCl$.

Category β -Adrenergic receptor stimulating agent.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Isoprenaline Hydrochloride Aerosol
(2) Isoprenaline Hydrochloride Injection

Isoprenaline Hydrochloride Aerosol

Isoprenaline Hydrochloride Aerosol contains not less than 90.0% and not more than 120.0% of the labelled amount of isoprenaline hydrochloride ($C_{11}H_{17}NO_3 \cdot HCl$). It contains 0.200%-0.325% (g/g) of isoprenaline hydrochloride in the inhalation.

Formula	Isoprenaline hydrochloride	2.5 g
	Ascorbic acid	1 g
	Ethanol	296.5 g
	Dichlorodifluoromethane	sufficient quantity
	To make	1000 g

Description A colourless or yellow, clear liquid in pressurized container; spray out as foggy particles on release of the delivery valve.

Identification (1) Dilute 1 drop of ferric chloride TS in a test tube with 5 ml of water, spray the liquid being examined for several times, a green colour is produced.

(2) Spray 3 times to 2 ml of 40% sodium acetate solution in a test tube, shake well, mix with 3 drops of mercuric chloride solution, a cherry red colour is produced.

Colour Remove the plastic coating of 3 containers. Mark the surface of liquid layer on the containers respectively. Punch a small hole on the aluminium cover and insert a needle for injection but does not contact the liquid surface. Remove the aluminium cover after complete evaporation of the propellant. Dilute to respective original volume with ethanol separately and shake well. Any colour produced is not more intense than that of reference solution Y_{10} (Appendix IX A, method 1). Repeat the test in the same manner with another 3 containers, if one container fails to pass the test. All comply with the requirements.

Other requirements Complies with the general requirements of aerosols (Appendix I L), except that the content in a unit spray is 80%-120% of the labelled amount.

Assay *Reference solution* Dissolve 35 mg, accurately weighed, of isoprenaline hydrochloride CRS in 0.005 mol/L sulfuric acid solution in 100 ml volumetric flask, dilute to volume and shake well.

Test solution Remove the plastic coating of 1 container,

accurately weighed, punch a small hole on the aluminium cover and insert a needle for injection without contact the surface of liquid. Connect the other end of the rubber tubing to a beaker containing 5 ml of ethanol, allow the propellant to evaporate slowly. Remove the aluminium cover, transfer the contents in the container with ethanol to a small beaker and evaporate to dryness over a water bath. Allow it to cool, dissolve the residue with a small quantity of 0.005 mol/L sulfuric acid solution in divided portions. Combine the aliquots of solution into 100 ml volumetric flask, dilute to volume with 0.005 mol/L sulfuric acid solution and shake well. Wash well the empty container, valve and aluminium cover, dry and weigh accurately. Calculate the concentration of isoprenaline hydrochloride in the aerosol being examined.

Procedure Filter the reference solution and the test solution respectively. Discard the initial filtrates and to 5 ml, accurately measured, of each the successive filtrates in 25 ml volumetric flask add 10 ml of 0.005 mol/L sulfuric acid solution, 5 ml of buffer solution (dissolve 5.04 g of sodium bicarbonate in 40 ml of a mixture of 1 ml of concentrate ammonia solution and 2.25 g of glycine and dilute with water to 50 ml), 1 ml of ferrous citrate solution (dissolve 1.5 g of ferrous sulfate in 200 ml of an aqueous solution containing 0.3 ml of dilute hydrochloric acid and 1 g of sodium bisulfite; dissolve 0.5 g of sodium citrate in 10 ml of the solution before use), dilute to volume with 0.005 mol/L sulfuric acid solution and shake well. Allow the solution to stand for 5 minutes, measure the absorbances of the resulting solutions at 530 nm (Appendix IV A) respectively. Calculate the content of $C_{11}H_{17}NO_3 \cdot HCl$.

Category As described under Isoprenaline Hydrochloride.

Strength 14 g per container, containing 35 mg of isoprenaline hydrochloride; 0.175 mg of isoprenaline hydrochloride in a unit spray.

Storage Preserve in well closed containers, protected from light, stored in a dark and cool place.

Isoprenaline Hydrochloride Injection

Isoprenaline Hydrochloride Injection is a sterile solution of Isoprenaline Hydrochloride in Water for Injection. It contains not less than 85.0% and not more than 110.0% of the labelled amount of isoprenaline hydrochloride ($C_{11}H_{17}NO_3 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Dilute a quantity each of isoprenaline hydrochloride injection and isoprenaline hydrochloride CRS with 80% methanol to produce the solution of 0.2 mg per ml as the test solution and reference solution respectively. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel as the coating substance and ethyl acetate-isopropanol-water-concentrated ammonia solution (50 : 30 : 16 : 4) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry it in air, place it in a chamber saturated with diethylamine vapors about a few minutes and spray with diazotized *p*-nitroaniline TS. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) To 2 ml add 2 drops of ferric chloride TS, a deep green colour is produced, it turns to blue and then to red on adding dropwise freshly prepared 5% sodium bicarbonate solution.

pH value 2.5-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Mix thoroughly an accurately measured quantity of the injection, equivalent to about 1 mg of isoprenaline hydrochloride, with 7 g of chromatographic kieselguhr and 2 ml of a buffer solution (dissolve 10.89 g of potassium dihydrogen phosphate and 3.48 g of dipotassium hydrogen phosphate in water and dilute with water to 100 ml) and transfer the mixture to a chromatographic column (25 mm \times 250 mm). Use 1 g of Kieselguhr to wash the container by means of dry cleaning and transfer it to the column. Pass 50 ml of ether saturated with water through the column and discard it, then elute with 50 ml of a solution of bis (α -ethyl hexyl) phosphoric acid in ether saturated with water (1 \rightarrow 50), and collect the eluate. Wash the bottom of the column with ether, combine the washings and eluate to a separator containing 10 ml of sulfuric acid solution (1 \rightarrow 350). Shake, transfer the acid layer to a 25 ml volumetric flask. Extract further with 10 ml of sulfuric acid solution (1 \rightarrow 350) from the ether layer. Combine the acid layers in the volumetric flask and dilute with sulfuric acid solution (1 \rightarrow 350) to volume and mix well. Measure the absorbance at 250 nm, 278 nm and 300 nm (Appendix IV A), calculate the correct absorbance at 278 nm on the baseline between the maxima at 250 nm and 300 nm. To a quantity of isoprenaline hydrochloride CRS, accurately weighed, add sulfuric acid solution (1 \rightarrow 350) to produce a solution of 0.5 mg per ml. Repeat the operation. Calculate the content of isoprenaline hydrochloride ($C_{11}H_{17}NO_3 \cdot HCl$) with reference to the ratio of the absorbance obtained from test solution to that obtained from the reference solution.

Category As described under Isoprenaline Hydrochloride.

Strength 2 ml : 1 mg

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Isosorbide Dinitrate

$C_6H_8N_2O_8$ 236.14

[16051-77-7]

Isosorbide Dinitrate is 1, 4 : 3, 6-dianhydro-D-glucitol dinitrate. It contains not less than 97.0% and not more than 102.0% of $C_6H_8N_2O_8$, calculated on the dried basis.

Description A white crystalline powder; odourless. Freely soluble in acetone or chloroform; sparingly soluble in ethanol; slightly soluble in water.

Melting range 68-72°C (Appendix VI C).

Specific optical rotation +135° to +140° in a solution of 10 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) Dissolve about 10 mg in a mixture of 1 ml of water and 2 ml of sulfuric acid in a test tube, cool and slowly add 3 ml of ferrous sulfate TS alongside the wall to form two layers; a brown colour is produced at the interface between the two layers.

(2) To 2 mg add 3 ml of freshly prepared 10% catechol solution, and mix well. Add 6 ml of sulfuric acid with caution; a dark green colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of isosorbide (Appendix XVI).

Nitrate To 0.25 g add 5 ml of water in a test tube, shake for 5 minutes. Filter and add 5 ml of sulfuric acid to the filtrate, mix and cool to room temperature. Slowly add 5 ml of ferrous sulfate TS alongside the wall to form two layers; no brown colour is produced immediately at the interface between the two layers.

Loss on drying When dried to constant weight in a desiccator using silica gel as desiccant, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (54 : 46) as the mobile phase. Detection wavelength is 230 nm and the number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of isosorbide dinitrate. The resolution factor between the peaks of isosorbide dinitrate and internal standard complies with the related requirements.

Internal standard solution Dissolve an accurately weighed quantity of hydrocortisone in the mobile phase to produce a solution of 80 µg per ml as the internal standard solution.

Procedure Dissolve about 25 mg of isosorbide dinitrate CRS, accurately weighed, with 27 ml of methanol in a 50 ml volumetric flask, add a quantity of water and allow to cool to room temperature, dilute with water to volume and mix well. Measure accurately 5 ml each of the reference solution and internal standard solution to a 25 ml volumetric flask, dilute with the mobile phase to volume and mix well. Inject 20 µl of the resulting solution into the column and calculate the correction factor. Repeat the operation, using 25 mg of the substance being examined instead of isosorbide dinitrate CRS, calculate the content of $C_6H_8N_2O_8$.

Category Vasodilator

Storage Preserve in tightly closed containers.

Preparation (1) Isosorbide Dinitrate Cream
(2) Isosorbide Dinitrate Spray
(3) Isosorbide Dinitrate Tablets

Isosorbide Dinitrate Cream

Isosorbide Dinitrate Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of isosorbide dinitrate ($C_6H_8N_2O_8$).

Description White or creamy white cream.

Identification (1) Extract a quantity equivalent to about 15 mg of isosorbide dinitrate in a separator with a mixture of 10 ml of cyclohexane, 5 ml of methanol and 1 ml of saturated sodium chloride solution. Separate the methanol layer to another separator which contains 5 ml of 5% potassium aluminium sulfate solution, extract with 10 ml of chloroform. Filter the chloroform layer through anhydrous sodium sulfate. Evaporate the filtrate to dryness on a water bath, dissolve the residue on adding 1 ml of water and 2 ml of sulfuric acid, mix well, and transfer to a test tube, cool to room temperature and add alongside the wall 3 ml of ferrous sulfate TS to form a subjacent layer, a brown colour is produced at the junction of the liquids.

(2) To a quantity equivalent to about 2 mg of isosorbide

dinitrate add 3 ml of freshly prepared 10% catechol solution, mix well. Add dropwise 2 ml of sulfuric acid by shaking, a dark green colour is produced.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Reference solution Weigh accurately 34.25 mg of potassium nitrate, previously dried at 105°C to constant weight, transfer it to a 200 ml volumetric flask and dissolve in 3 ml of water, dilute with glacial acetic acid to volume, mix well (Each ml is equivalent to 200 µg of $C_6H_8N_2O_8$).

Test solution Dissolve a quantity equivalent to 0.1 g of isosorbide dinitrate, accurately weighed, in 20 ml of glacial acetic acid in a 70°C water bath. Allow to stand for 30 minutes in a 15 °C water bath, filter through dry filter paper, wash the filter with glacial acetic acid. Combine the filtrate and the washings in a 50 ml volumetric flask, cool to room temperature, dilute with glacial acetic acid to volume and mix well. Measure accurately 5 ml of the solution to another 50 ml volumetric flask, dilute with glacial acetic acid to volume and mix well.

Procedure Measure accurately 1 ml each of above two solutions to separate 25 ml volumetric flasks. Take 1 ml of glacial acetic acid in another 25 ml volumetric flask as blank. Add accurately 2 ml of phenoldisulfonic acid TS to each flask and mix well, allow to stand for 15 minutes, add 10 ml of water, cool in an ice bath. Add slowly 8 ml of concentrated ammonia solution, cool to room temperature and dilute with water to volume, mix well. Measure the absorbance at 405 nm (Appendix IV A), calculate the content of $C_6H_8N_2O_8$.

Category As described under Isosorbide Dinitrate.

Strength 10 g : 1.5 g

Storage Preserve in tightly closed containers, stored in a cool place.

Isosorbide Dinitrate Spray

Isosorbide Dinitrate Spray contains not less than 80.0% and not more than 120.0% of labelled amount of isosorbide dinitrate ($C_6H_8N_2O_8$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Transfer a quantity, equivalent to about 10 mg of isosorbide dinitrate, to a test tube, add 2 ml of sulfuric acid, mix well and cool to room temperature. Slowly add 3 ml of ferrous sulfate TS along the wall of test tube to form two layers; a brown colour is produced at the interface between the two layers.

(2) The retention time of the principal peak in the chromatogram of the test solution in the Assay is identical with that of the principal peak in the chromatogram of the reference preparation.

Total number of discharges per container Select 3 containers, actuate each valve continually in fume hood, until the container is empty. For each container containing 20 ml, the total number of discharges per container is not less than 180.

Related substances Measure accurately 1 ml of the substance being examined into a 10 ml volumetric flask, dilute with mobile phase to volume, mix well as test solution. Measure accurately 1 ml of the test solution, into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as reference solution. Carry out the method as described under Assay. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% full scale of the

chart. Inject separately 20 μ l each of the test solution and the reference solution into the column, record the chromatogram for twice of the retention time of the principal peak. The sum of the areas of the peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principle peak in the chromatogram obtained with the reference solution.

Other requirements Complies with the general requirements for aerosols except the content of active ingredient of each spray is not less than 70% and not more than 130% of the labelled amount of isosorbide dinitrate (Appendix I L).

Assay Measure accurately 2 ml of the substance being examined into a 50 ml volumetric flask, dilute with mobile phase to volume, mix well. Measure accurately 5 ml of the resulting solution and 5 ml of the internal standard solution obtained under Isosorbide Dinitrate for the Assay into a 25 ml volumetric flask, dilute with mobile phase to volume, mix well as test solution. Carry out the method as described under the Isosorbide Dinitrate for the Assay. Inject 20 μ l of the test solution into the column and record the peak area in the chromatogram. Calculate the content of $C_6H_8N_2O_8$ by the internal standard method.

Category As described under Isosorbide Dinitrate.

Strength (1) 10 ml : 0.125 g, containing 0.625 mg of isosorbide dinitrate of each spray
(2) 20 ml : 0.25 g, containing 1.4 mg of isosorbide dinitrate of each spray

Storage Preserve in well closed containers, protected from light, stored at a room temperature of 20°C.

Isosorbide Dinitrate Tablets

Isosorbide Dinitrate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of isosorbide dinitrate ($C_6H_8N_2O_8$).

Description White tablets.

Identification To a quantity of powdered tablets, equivalent to about 20 mg of isosorbide dinitrate, add 10 ml of chloroform, shake thoroughly, and filter. Evaporate the filtrate on a water bath to dryness. The residue has a melting range of 67-72°C (Appendix VI C). The residue also complies with test (1) for Identification described under Isosorbide Dinitrate.

Content uniformity Comply with the requirement for content uniformity (Appendix X E). Triturate 1 tablet with the mobile phase and transfer to a 50 ml volumetric flask, add a quantity of the mobile phase, shake for 15 minutes to dissolve isosorbide dinitrate, dilute with mobile phase to volume and mix well. Filter, discard the initial filtrate. Carry out the method for high performance liquid chromatography (Appendix V D) described in Assay. Inject 20 μ l of the successive filtrate into the column, record the peak area obtained in the chromatogram. Dissolve an accurately weighed quantity of isosorbide dinitrate CRS, previously tested for Loss on drying, in the mobile phase to produce a solution of 0.1 mg per ml, repeat the operation. Calculate the content of $C_6H_8N_2O_8$ with the peak area obtained in the chromatogram by the external standard method.

Dissolution Comply with dissolution test (Appendix VI C, method 2), using 500 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution at exact 45 minutes, and

filter. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-ammonium sulfate (0.1 mol/L) BS (pH 3.0 \pm 0.1) (53 : 47) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to peak of isosorbide dinitrate. Inject 100 μ l of the successive filtrate into the column, record the chromatogram. Dissolve 10 mg of isosorbide dinitrate CRS in 5 ml of methanol in a 100 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 5 ml to a 50 ml volumetric flask (for strength 5 mg) or 25 ml volumetric flask (for strength 10 mg), dilute with water to volume and mix well, repeat the operation. Calculate the content of $C_6H_8N_2O_8$ with respect to the peak area obtained in the chromatogram by the external standard method, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Shake a quantity of the powder equivalent to about 5 mg of isosorbide dinitrate, accurately weighed, in a 50 ml volumetric flask with a quantity of the mobile phase for 15 minutes, add 10 ml, measured accurately, of the internal standard solution and dilute with the mobile phase to volume, mix well and filter. The successive filtrate is a test solution. Carry out the Assay described under Isosorbide Dinitrate.

Category, Storage As described under Isosorbide Dinitrate.

Strength (1) 5 mg (2) 10 mg

Isotretinoin

$C_{20}H_{28}O_2$ 300.44

Isotretinoin is 3, 7-dimethyl-9-(2, 6, 6-trimethylcyclohex-1-enyl)-2-cis-4-trans-6-trans-8-trans-nonatetraacenoic acid. It contains not less than 98.0% and not more than 102.0% of $C_{20}H_{28}O_2$, calculated on the dried basis.

Description A yellow to orange yellow crystalline powder. Soluble in chloroform or ether; slightly soluble in ethanol or isopropanol, practically insoluble in water.

Identification (1) To a quantity add acidified isopropanol solution (dilute 1 ml of 0.1 mol/L hydrochloric acid solution with isopropanol to 1000 ml) to produce a solution of 4 μ g per ml. The light absorption of the solution exhibits a maximum at 354 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of Isotretinoin (Appendix XI).

Tretinoin Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica gel (5 μ m) and a mixture of isooctane-isopropanol-glacial acetic acid (99.65 : 0.25 : 0.1) as the mobile phase. Detection wavelength is 352 nm, and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of tretinoin. The resolution factor between the peaks of tretinoin and

isotretinoin is more than 1.0. Dissolve a quantity of tretinoin CRS, accurately weighed, in a quantity of dichloromethane, dilute with isooctane to produce a reference solution of 2.5 μg per ml. Repeat the operation, using isotretinoin instead of tretinoin CRS, to produce a test solution of 250 μg per ml. Separately inject 20 μl of reference solution and test solution into the column. The peak area of tretinoin in the chromatogram obtained with the test solution is not greater than that of principal peak obtained with the reference solution.

Loss on drying When dried at 105 °C for 3 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.24 g, accurately weighed, in 30 ml of dimethylformamide, add 3 drops of the solution of thymol blue in dimethylformamide (1 \rightarrow 100), titrate with sodium methoxide (0.1 mol/L) VS until the colour turns to green. Perform a blank determination and make any necessary correction. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 30.04 mg of $\text{C}_{20}\text{H}_{28}\text{O}_2$.

Category Treatment of acne.

Storage Preserve in a tightly closed container, filled with inert gas, stored in a 0 to 5°C place and protected from light.

Preparation Isotretinoin Soft Capsules

Isotretinoin Soft Capsules

Isotretinoin Soft Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Isotretinoin ($\text{C}_{20}\text{H}_{28}\text{O}_2$).

Description Dark brown capsules containing orange-yellow oily suspension.

Identification Dilute the content of the capsules with acidified isopropanol solution (dilute 1 ml of 0.1 mol/L hydrochloric acid solution with isopropanol to 1000 ml) to produce a solution of 4 μg per ml. The light absorption of the solution exhibits maximum at 354 nm (Appendix IV A).

Content uniformity Protect from light throughout the procedure. Comply with the requirements for content uniformity (Appendix X E). Carefully cut the top of 1 Capsule with scissors, transfer the content to a 50 ml volumetric flask and the opened empty shell to a 25 ml beaker respectively, wash the shell and the scissors with 10 ml of dichloromethane in portions, combine the washings to the 50 ml volumetric flask, shake thoroughly to dissolve, add isooctane to volume, mix well. Measure accurately 2 ml to another 100 ml volumetric flask, dilute to volume with isooctane, mix well. Measure the absorbances of the resulting solution and the reference solution obtained in the Assay at 361 nm (Appendix IV A). Calculate the content of isotretinoin ($\text{C}_{20}\text{H}_{28}\text{O}_2$).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Transfer an accurately weighed quantity of the mixed contents of 20 Capsules equivalent to about 10 mg of isotretinoin to a 50 ml volumetric flask, add 5 ml of

dichloromethane shake to dissolve, dilute with isooctane to volume, mix well. Transfer 2 ml, accurately measured, to another 100 ml volumetric flask, dilute with isooctane to volume, mix well. Measure the absorbance at 361 nm (Appendix IV A). Weigh accurately a quantity of isotretinoin CRS (calculated on the dried basis), proceed in the same manner. Calculate the content of $\text{C}_{20}\text{H}_{28}\text{O}_2$.

Category As described under Isotretinoin.

Strength 10 mg

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Kanamycin Sulfate

[133-92-6]

Kanamycin Sulfate is O-3-amino-3-deoxy- α -D-glucopyranosyl-(1 \rightarrow 6)-O [6-amino-6-deoxy- α -D-glucopyranosyl-(1 \rightarrow 4)]-2-deoxy-D-stroptamine sulfate. It has not less than 67.0% of $\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$, calculated on the dried basis.

Description A white or almost white powder; odourless; hygroscopic.

Freely soluble in water; practically insoluble in ethanol, acetone chloroform or ether.

Specific optical rotation +102° to +110°, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 1 mg in 2 ml of water, add 4 ml of a 0.2% solution of anthrone in sulfuric acid, heat on a water bath for 15 minutes and allow to cool; a bluish-purple colour is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of kanamycin sulfate CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of kanamycin sulfate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity or alkalinity Dissolve 3 g in 10 ml of water, pH 6.0-8.0 (Appendix VI H).

Clarity and colour of solution To 5 portions of 1.7 g each add 5 ml of water, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Kanamycin B Dissolve an accurately weighed quantity of the substance being examined in water to produce solution of 2 mg of kanamycin per ml as the test solution; then dissolve

an accurately weighed quantity of the substance being examined in water to produce solution of 0.04 mg of kanamycin per ml as the reference solution. Carry out the method for Assay. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. Measure accurately 20 μ l of test solution and reference solution into the column respectively and record the chromatogram, the peak area of kanamycin B obtained from test solution is not greater than 2.0% of principal peak of reference solution.

Sulfates Dissolve about 0.18 g, accurately weighed, in 100 ml of water and adjust the solution to pH 11 using concentrated ammonia solution. Add 10 ml of barium chloride (0.1 mol/L) VS and 5 drops of phthalein purple IS. Titrate with disodium edetate (0.05 mol/L) VS, make sure to keep the pH value 11 during the titration, adding 50 ml of ethanol when the colour of the solution begins to change, and continue the titration until the bluish-purple colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of sulfate (SO_4). The content of SO_4 is 23.0%-26.0%, calculated on the dried basis.

Loss on drying When dried for 3 hours at 105°C, loses not more than 4.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.4 EU per ml.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), to each portion add not less than 500 ml of 0.9% sterile sodium chloride solution respectively. Meanwhile, transfer 0.25-0.5 ml of a solution of 30 mg per ml to each of six tubes containing 10 ml of a 0.5% glucose broth, allow three of tubes incubated at 30-35°C and the remainder incubated at 20-25°C. All the results comply with the requirement.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.2 mol/L trifluoroacetic acid-methanol (95 : 5) as the mobile phase; detected by ELSD (The flux is 0.3 L per minute; maintain the excursion column temperature at 110°C). Dissolve Kanamycin CRS and Kanamycin B CRS in water to produce a mixture solution containing 80 μ g per ml. Inject 20 μ l into the column, the resolution factor between Kanamycin and Kanamycin B is not less than 5.0; calculate the 5 times injection results, the relative standard derivation (RSD) for replicate injection is less than 2.0 %.

Procedure Dissolve an accurate quantity of Kanamycin CRS in water to produce the solution containing 0.10, 0.15, 0.20 mg per ml. Inject 20 μ l into the column, record the chromatogram. Calculate the regression equation, using the logarithm of reference solution concentration and corresponding peak area; correlation coefficient should be not less than 0.99; Dissolve an another accurate quantity of Kanamycin CRS in water to produce the solution containing 0.15 mg per ml, repeat the operation. Calculate the content of $\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$ using regression equation.

Category Aminoglycoside Antibiotics.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation (1) Kanamycin Sulfate Eye Drops
(2) Kanamycin Sulfate for Injection
(3) Kanamycin Sulfate Injection

Kanamycin Sulfate Eye Drops

Kanamycin Sulfate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled potency of Kanamycin ($\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$). It may contains suitable preservatives.

Description A clear, colourless to slightly yellow or slightly yellow green liquid.

Identification Comply with the tests (1), (2) and (4) for Identification described under Kanamycin Sulfate.

pH value 6.0-7.0 (Appendix VI H).

Colour The eye drops are colourless; any colour produced is not more intense than that of reference solution Y_3 or YG_3 (Appendix IX A, method 1).

Osmotic pressure Osmolar concentration is 260-320 mO₂/mol/kg (Appendix IX G).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Measure accurately a quantity, dilute to produce a solution of 0.15 mg per ml with water and carry out the Assay described under Kanamycin Sulfate.

Category As described under Kanamycin sulfate.

Strength 8 ml : 40 mg (calculated as $\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$)

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Kanamycin Sulfate for Injection

Kanamycin Sulfate for Injection is a sterile powder of kanamycin sulfate. It contains not less than 65.0% of Kanamycin ($\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$), calculated on the dried basis. It contains not less than 93.0% and not more than 107.0% of the labelled potency of Kanamycin ($\text{C}_{18}\text{H}_{36}\text{N}_4\text{O}_{11}$), calculated on the basis of the average weight of contents.

Description A white or almost white powder.

Identification Comply with the tests (1), (2) and (4) for Identification described under Kanamycin Sulfate.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.2 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); Any colour produced is not more intense than that of reference solution Y_4 or YG_4 (Appendix IX A, method 1).

Kanamycin B Using the mixed contents obtained from the test for weight variation of the contents. Dissolve an accurately quantity of the substance being examined in water to produce solution containing 2 mg of Kanamycin per ml as the test solution; then dissolve an accurately weighed quantity of the substance being examined in water to produce solution containing 0.08 mg of Kanamycin per ml as the reference solution. Carry out the method for assay under Kanamycin Sulfate. The peak area of Kanamycin B obtained from test solution is not greater than the area of principal peak of reference solution (4.0%).

Loss on drying When dried for 3 hours at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Acidity or alkalinity, Bacterial Endotoxin and Sterility Comply with the corresponding requirements described under Kanamycin Sulfate.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Kanamycin Sulfate, using the mixed contents obtained from the test for weight variation of the contents.

Category As described under Kanamycin Sulfate.

Strength Calculated as $C_{18}H_{36}N_4O_{11}$ (1) 0.5 g (2) 1 g

Storage Preserve in tightly closed containers, stored in a dry place.

Kanamycin Sulfate Injection

Kanamycin Sulfate Injection is a sterile solution of kanamycin sulfate. It contains not less than 90.0% and not more than 110.0% of the labelled potency of Kanamycin ($C_{18}H_{36}N_4O_{11}$).

Description A clear, colourless to slightly yellow or yellowish-green liquid.

Identification Comply with the tests (1), (2) and (4) for Identification described under Kanamycin Sulfate.

pH value 4.5-7.5 (Appendix VI H).

Colour The solution is colourless; any colour produced is not more intense than that of reference solution Y_4 or YG_4 (Appendix IX A, method 1).

Kanamycin B Dissolve an accurately weighed quantity of the substance being examined in water to produce solution of 2 mg of Kanamycin per ml as the test solution; then dissolve an accurately weighed quantity of the substance being examined in water to produce solution of 0.08 mg of Kanamycin per ml as the reference solution. Carry out the method for assay under Kanamycin Sulfate. The peak area of Kanamycin B obtained from test solution is not greater than the area of principal peak of reference solution.

Sterility Comply with the test for sterility (Appendix XI H, membrane filtration method), dissolving each content in not less than 500 ml of 0.9% sterile sodium chloride solution respectively.

Bacterial endotoxin Complies with the corresponding requirements described under Kanamycin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity and carry out the Assay described under Kanamycin Sulfate.

Category As described under Kanamycin Sulfate.

Strength 2 ml : 0.5 g (500000 Units)

Storage Preserve in well closed containers.

Ketamine Hydrochloride

$C_{13}H_{16}ClNO \cdot HCl$ 274.19

[1867-66-9]

Ketamine Hydrochloride is 2-(2-chlorophenyl)-2-methylamino-cyclohexanone hydrochloride. It contains not less than 99.0% of $C_{13}H_{16}ClNO \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless. Freely soluble in water; soluble in hot ethanol; insoluble in ether or benzene.

Identification (1) Dissolve about 0.2 g in 4 ml of water, cool in an ice bath, add 10% potassium carbonate solution dropwise to about pH 10, allow to stand and filter. Wash the crystals with water, dry in vacuum over phosphorous pentoxide. The melting point is 91-94°C (Appendix VI C).

(2) The light absorption of a solution of 0.3 mg per ml in water exhibits maxima at 269 nm and 277 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ketamine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.0-5.5 (Appendix VI H).

Clarity of Solution A solution of 1.0 g in 10 ml of water is clear, any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid by warming, cool to room temperature, then add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 27.42 mg of $C_{13}H_{16}ClNO \cdot HCl$.

Category General anaesthetic by intravenous injection.

Storage Preserve in tightly closed containers.

Preparation Ketamine Hydrochloride Injection

Ketamine Hydrochloride Injection

Ketamine Hydrochloride Injection is a sterile solution of Ketamine Hydrochloride in Water for Injections. It contains not less than 90.0% and not

more than 110.0% of the labelled amount of ketamine ($C_{13}H_{16}ClNO$).

Description A clear, colourless liquid.

Identification (1) To 2 drops add 4 ml of 0.5% sulfuric acid solution and 1 drop of potassium iodobismuthate TS; a reddish-brown precipitate is produced.
(2) Complies with test (2) for Identification described under Ketamine Hydrochloride.

pH value 3.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To an accurately measured quantity equivalent to about 0.2 g of ketamine hydrochloride in a separator add sufficient water to produce 25 ml. Make alkaline with 1.5 ml of ammonia TS and extract with chloroform for four times (25, 20, 15 ml and 15 ml respectively). Wash the chloroform extracts with the same 15 ml of water and filter through cotton wool moistened with chloroform. Wash the cotton wool and the filter with 5 ml of chloroform. Combine the chloroform extracts and washings, evaporate to dryness on a water bath and cool. Dissolve the residue in a mixture of 2 ml of acetic anhydride and 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.77 mg of $C_{13}H_{16}ClNO$.

Category As described under Ketamine Hydrochloride.

Strength (1) 2 ml : 0.1 g (2) 10 ml : 0.1 g
(3) 20 ml : 0.2 g

Storage Preserve in well closed containers.

Ketoconazole

$C_{26}H_{28}Cl_2N_4O_4$ 531.44

Ketoconazole is \pm cis-1-acetyl-4-[4-[2-(2,4-dichlorophenyl)-2-(1H-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl] methoxy] phenyl piperazine. It contains not less than 98.5% of $C_{26}H_{28}Cl_2N_4O_4$, calculated on the dried basis.

Description An almost white crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in methanol; slightly soluble in ethanol; practically insoluble in water.

Melting range 147-151°C (Appendix VI C).

Specific optical rotation -1° to $+1^\circ$, in a solution of 40 mg per ml in methanol (Appendix VI E).

Identification (1) Dissolve about 10 mg in 5 ml of 0.1 mol/L hydrochloric acid solution, add a few drops of potassium iodobismuthate TS, an orange-red precipitate is produced.
(2) Dissolve about 60 mg, accurately weighed, in 10 ml of 0.1 mol/L hydrochloric acid solution in a 100 ml volumetric flask, dilute with water to volume, mix well. Transfer 25 ml to a 100 ml volumetric flask, dilute with 0.01 mol/L

hydrochloric acid solution to volume, mix well. Transfer 10 ml to a 100 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume. The light absorption of the resulting solution exhibits maxima at 221 nm and 269 nm, and a shoulder peak at 276 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Ketoconazole (Appendix XVI).

Clarity and colour of chloroform solution Dissolve 0.30 g in 10 ml of chloroform, the solution is clear; any colour produced is not more intense than that of reference solution OY₅ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-hexane-ethyl acetate-methanol-water-glacial acetic acid (42 : 40 : 15 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μ l of each of four solutions in chloroform containing (1) 10 mg per ml, (2) 50 μ g per ml, (3) 100 μ g per ml, (4) 150 μ g per ml of the substance being examined. After developing and removal of the plate, dry it in air and expose it to iodine vapour until the spots appear. The intensity of any secondary spot in the chromatogram obtained with solution (1) is compared with that of the principal spots obtained with solution (2), (3) and (4), the total impurity is not more than 1.5%.

Loss on drying When dried in vacuum at 80°C for 4 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 40 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS, perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.57 mg of $C_{26}H_{28}Cl_2N_4O_4$.

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ketoconazole Cream
(2) Compound Ketoconazole Cream

Ketoconazole Cream

Ketoconazole Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$).

Description A creamy white or pale red cream.

Identification (1) To about 0.5 g, add 10 ml of 0.1 mol/L hydrochloric acid solution, heat in a water bath to dissolve ketoconazole, cool and filter, to the filtrate add few drops of potassium iodobismuthate TS, an orange-red precipitate is produced.
(2) The light absorption of the solution obtained in the Assay exhibits maximum at 244 nm (Appendix IV A).

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay To about 2 g, accurately weighed, add 25 ml of 0.1 mol/L hydrochloric acid solution in a beaker, heat in a water

bath, stir thoroughly to dissolve ketoconazole, allow to cool. Filter, transfer the filtrate to a separator, repeat the operation three times, combine the filtrates, add ammonia TS to neutralize until a precipitate is just produced, add one drop of ammonia TS, extract with three 25 ml portions of chloroform, filter all the chloroform extracts into a 100 ml volumetric flask through a wad of absorbent cotton moistened with chloroform. Wash the cotton and filter with a quantity of chloroform, combine the filtrates and washings, dilute with chloroform to volume, mix well as test preparation. Dissolve an accurately weighed quantity of ketoconazole CRS previously dried in vacuum at 80°C for 4 hours to produce a solution of about 0.4 mg per ml as reference preparation. To 2 ml of each of the two preparations, accurately measured, in separate 50 ml volumetric flasks, add with dehydrated ethanol to volume, mix well. Measure the absorbance at 244 nm (Appendix IV A), calculate the content of $C_{25}H_{28}Cl_2N_4O_4$ S.

Category Antifungal.

Strength 10 g : 0.2 g

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Compound Ketoconazole Cream

Compound Ketoconazole Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$), not less than 85.0% and not more than 115.0% of the labelled amount of clobetasol propionate ($C_{25}H_{32}ClFO_5$), not less than 90.0% and not more than 120.0% of the labelled potency of neomycin sulfate.

Formula	Ketoconazole	10 g
	Clobetasol Propionate	0.25 g
	Neomycin Sulfate	5000000 Units
	Base	a quantity
	to make	1000 g

Description A white or almost white cream.

Identification (1) The retention time of two principal peaks in the chromatogram of the test preparation obtained under the Assay for ketoconazole and clobetasol propionate corresponds with that of the principal peaks in the chromatogram of the —————.

(2) Transfer about 1.5 g of cream, equivalent to about 7500 Units of neomycin sulfate, in a conical flask with stopper, add 10 ml of trichloromethane and 5 ml of water, shake thoroughly, centrifuge, take the supernate as test solution. Dissolve a quantity of neomycin sulfate CRS in water to produce a reference solution of 2 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of methanol-ammonia solution (13.5 mol/L)-trichloromethane (60 : 40 : 20) as the mobile phase. Apply separately to the plate 5 µl each of above two solutions, after developing and removal of the plate, dry it in air, spray with a solution of 1% ninhydrin in butanol, heat at 105°C for 2 minutes. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Other requirements Comply with the general requirements for Cream (Appendix I F).

Assay Ketoconazole and Clobetasol Propionate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with

octadecylsilane bonded silica gel and a mixture of methanol-water (74 : 26) as the mobile phase. Detection wavelength is 239 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of ketoconazole. The resolution factor between the peaks of ketoconazole and clobetasol propionate is greater than 2.0.

Procedure To about 4 g of cream, accurately weighed, add a quantity of anhydrous ethanol. Heat in a water bath at 80°C to dissolve ketoconazole and clobetasol propionate, transfer thoroughly to a 50 ml volumetric flask with anhydrous ethanol, cool to room temperature, dilute to volume with the same solvent, mix well. Cool in an ice bath for at least 2 hours, filter rapidly. Take the successive filtrate standing at room temperature for 15 minutes as test solution. Inject 10 µl of the test solution into the column, record the chromatogram. Weigh accurately a quantity of ketoconazole CRS and clobetasol propionate CRS, add anhydrous ethanol to produce a reference solution of 0.8 mg of ketoconazole CRS and 20 µg of clobetasol propionate CRS per ml. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{26}H_{28}Cl_2N_4O_4$ and $C_{25}H_{32}ClFO_5$ respectively with respect to the peak areas obtained in the chromatogram by the external standard method.

Neomycin Sulfate Weigh accurately about 2 g into a 100 ml conical flask with stopper, add 50 ml of petroleum ether (boiling range: 90-120°C), treat with the aid of an ultrasonic bath for about 30 minutes to dissolve the base, transfer to a separator. Extract with 3% sodium chloride in phosphate BS (pH 7.8) for four times, each of 20 ml. Combine the extracts to a 100 ml volumetric flask, dilute with the same BS to volume, mix well. Carry out the Microbiological Assay of Antibiotics (Appendix XI A).

Category Antifungal.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Ketoprofen

$C_{16}H_{14}O_3$ 254.29

[22071-15-4]

Ketoprofen is α -methyl-3-benzoylbenzeneacetic acid. It contains not less than 98.5% of $C_{16}H_{14}O_3$, calculated on dried basis.

Description A white crystalline powder, odourless or almost odourless.

Very soluble in methanol; freely soluble in ethanol, acetone or ether, practically insoluble in water.

Melting point 93-96°C (Appendix VI C).

Identification (1) Dissolve about 50 mg in 1 ml of ethanol, add 1 ml of dinitrophenyldrazine TS and mix well. Heat to boiling, cool; an orange precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ketoprofen (Appendix XVI).

Clarity and colour of methanol solution Dissolve 0.30 g in 25 ml of methanol, the solution is clear and colourless. Any opalescence produced is not more pronounced than that of

reference suspension 1 (Appendix IX B); any colour produced is not more intense than the mixture of reference solution Y₁ 10 ml and water 10 ml (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and toluene-isopropyl ether-formic acid (70 : 30 : 1) as the mobile phase. Apply separately to the plate 5 µl of each of three solutions in acetone containing (1) 100 mg per ml, (2) 0.5 mg per ml, (3) 0.2 mg per ml. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). Any spot, other than the principal spot in chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) and not more than three spots are more intense than the principal spot in the chromatogram obtained with solution (3).

Loss on drying When dried in vacuum at 60°C over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%; using 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in test for Residue on ignition: not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 25 ml of neutral ethanol (neutral to phenolphthalein IS) add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.43 mg of C₁₆H₁₄O₃.

Category Anti-inflammatory and analgesic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ketoprofen Enteric-coated Capsules
(2) Ketoprofen Liniment

Ketoprofen Enteric-coated Capsules

Ketoprofen Enteric-coated Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ketoprofen (C₁₆H₁₄O₃).

Description Capsules with white powder contents.

Identification (1) Dissolve a quantity of the contents of capsules equivalent to 0.25 g of ketoprofen in 5 ml of ethanol by shaking, filter. The filtrate complies with the tests for Identification (1) described under Ketoprofen.

(2) Dissolve a quantity of the contents of capsules in 75% methanol to produce a solution of 10 µg per ml, filter. The light absorption of the successive filtrate exhibits a maximum at 258 nm. (Appendix IV A).

Drug Release Complies with the requirements for drug release test (Appendix X D method 2 (1)), with the apparatus of dissolution test method 1 and using 750 ml of 0.1 mol/L hydrochloric acid solution as the release medium and adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of solution after exactly 2 hours and filter. Take the successive filtrate as solution (1). Add 250 ml of 0.2 mol/L sodium phosphate solution (37°C) in the vessel, mix well (adjusting to pH 6.8 ± 0.05 with 2 mol/L hydrochloric acid or 2 mol/L sodium hydroxide solution if necessary). Withdraw 10 ml of solution after exactly 45 minutes and filter. Transfer 3 ml of the successive filtrate, accurately measured, in a 25 ml volumetric flask. Dilute to

volume with phosphate BS (pH 6.8) and mix well as solution (2). Empty a capsule, wash with methanol, and dry in air. Dissolve with the above phosphate BS (pH 6.8) and dilute to the same concentration of the capsule as that of the solution (2), as a blank solution. Measure the absorbances of the resulting solution at 260 nm (Appendix IV A), calculate the dissolution of C₁₆H₁₄O₃ from each capsule, taking 650 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve a quantity of the mixed contents in the test for weight variation of contents equivalent to about 0.5 g of ketoprofen in 30 ml of neutral ethanol (neutral to phenolphthalein IS) and filter with a sintered glass filter. Wash the container and filter with four portions of neutral ethanol, each of 5 ml. Combine the filtrate and washings, add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.43 mg of C₁₆H₁₄O₃.

Category As described under ketoprofen.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Ketoprofen Liniment

Ketoprofen Liniment contains not less than 90.0% and not more than 110.0% of the labelled amount of Ketoprofen (C₁₆H₁₄O₃).

Description A clear colourless or pale yellow solution.

Identification (1) To 1 ml add 1 ml of dinitro-phenyl hydrazine TS, mix well, heat until boil, cool, an orange-red precipitation is produced.

(2) The light absorption of a solution of 10 µg per ml in ethanol exhibits maximum at 255 nm (Appendix IV A).

pH value 5.6-7.0 (Appendix VI H).

Content of ethanol 65.0% to 75.0% (Appendix VII E).

Other requirements Complies with the general requirements for liniment (Appendix I T).

Assay Measure accurately 2 ml equivalent to about 60 mg of ketoprofen to a 100 ml brown volumetric flask, dilute with ethanol to volume, mix well. Measure accurately 2 ml to a 200 ml brown volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbances at 255 nm (Appendix IV A). Repeat the operation, using about 60 mg of ketoprofen CRS, accurately weighed, instead of the substance being examined. Calculate the content of C₁₆H₁₄O₃.

Category As described under Ketoprofen.

Strength 30 ml : 0.9 g

Storage Preserve in tightly closed containers, protected from light.

Ketotifen Fumarate

$C_{19}H_{19}NOS \cdot C_4H_4O_4$ 425.50 [34580-14-8]

Ketotifen Fumarate is 4, 9-dihydro-4-(1-methyl-4-piperidinylidene)-10*H*-benzo [4,5] cyclohepta [1,2-*a*] thiophen-10-one (*E*)-butenedioate. It contains not less than 98.5% of $C_{19}H_{19}NOS \cdot C_4H_4O_4$, calculated on the dried basis.

Description An almost white crystalline powder; odourless; taste, bitter.

Soluble in methanol; slightly soluble in water or ethanol; very slightly soluble in acetone or chloroform.

Melting range 191-195°C, with decomposition (Appendix VI C).

Identification (1) To about 5 mg, add 1 drop of sulfuric acid; an orange-yellow colour is produced, and disappears on adding 1 ml of water.

(2) To about 5 mg add 1 ml of dinitrophenylhydrazine TS, heat on a water bath; a red loose precipitate is produced.

(3) To about 0.1 g add 5 ml of sodium carbonate TS, shake and filter. To the filtrate add 4 drops of potassium permanganate TS; the red colour disappears and a brown precipitate is produced.

(4) An aqueous solution of 10 µg per ml exhibits maximum at 301 nm (Appendix IV A).

(5) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Ketotifen Fumarate (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-hexane-chloroform-methanol (6 : 3 : 1) as the mobile phase, and saturated the developing chamber with 5 ml of concentrated ammonia solution in a small beaker. Apply separately to the plate 10 µl each of two solution in ethanol containing (1) 10 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air. Spray with dilute bismuth potassium iodide TS. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 42.55 mg of $C_{19}H_{19}NOS \cdot C_4H_4O_4$.

Category Antihistaminic.

Storage Preserve in tightly closed containers, stored in cool and dark place.

Preparation (1) Ketotifen Fumarate Capsules
(2) Ketotifen Fumarate Eye Drops
(3) Ketotifen Fumarate Nasal Drops
(4) Ketotifen Fumarate Oral solution
(5) Ketotifen Fumarate Tablets

Ketotifen Fumarate Capsules

Ketotifen Fumarate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Ketotifen Fumarate, calculated on Ketotifen ($C_{19}H_{19}NOS$).

Description Capsules with white or almost white powder.

Identification (1) Dissolve a quantity of the finely powdered tablets equivalent to about 20 mg of ketotifen in 10 ml of water, stir thoroughly and filter. Concentrate 2 ml of the filtrate on a water bath to about 1 ml, cool, add 1 ml of sulfuric acid, a pale yellow colour is produced, and disappears on dilution with 2 ml of water.

(2) To 2 ml of the filtrate obtained under the Identification (1) add 1 ml of dinitrophenyl hydrazine TS, heat on a water bath, a red loose precipitate is produced gradually.

(3) The light absorption of the solution obtained under the Assay exhibits a maximum at 301 nm (Appendix IV A).

Content uniformity Transfer the content of 1 capsule to a 100 ml volumetric flask, wash the shell with water in divided portions, combine the washings to the same volumetric flask. Carry out the method described under the Assay, beginning at the words "shake to dissolve the Ketotifen Fumarate", the results comply with the requirements (Appendix X E).

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 200 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml after exactly 30 minutes and filter. Measure the absorbance of the successive filtrate at 301 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{19}NOS$ from each tablet, taking 465 as the value of *A* (1%, cm), Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately 20 capsules, remove the contents, weigh accurately the shell of each capsule and mix well. Dissolve a quantity equivalent to about 1 mg of ketotifen in a 100 ml volumetric flask with water by shaking, dilute with water to volume, mix well and filter. Measure the absorbance of the successive filtrate at 301 nm (Appendix IV A), calculate the content of $C_{19}H_{19}NOS$, taking 465 as the value of *A* (1%, 1 cm).

Category As described under Ketotifen Fumarate.

Strength 1 mg (calculated as $C_{19}H_{19}NOS$)

Storage Preserve in tightly closed containers, protected from light.

Ketotifen Fumarate Eye Drops

Ketotifen Fumarate Eye Drops contain not less than 90.0% and not more than 110.0% of the

labelled amount of ketotifen fumarate, calculated with reference to ketotifen ($C_{19}H_{19}NOS$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To about 5 ml add 1 ml of dinitrophenylhydrazine TS; a red curdy precipitate is produced on heating in a water bath.

(2) Dissolve a quantity of ketotifen fumarate CRS in ethanol to produce a solution of 0.5 mg per ml as reference solution. Use the eye drops as test solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethylacetate-methanol-strong ammonia solution (85 : 10 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions, after developing and removal of the plate, dry it in air and expose it to iodine vapours. The colour and position of principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The test solution obtained in Assay exhibits a maximum at 301 nm and a minimum at 256 nm (Appendix IV A).

pH value 4.8-5.8 (Appendix VI H).

Colour Any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Other requirements Comply with the general requirements for ophthalmic preparations (Appendix I G).

Assay Dilute a quantity, accurately measured, with water to produce a solution of 5 μ g of ketotifen per ml, measure the absorbance at 301 nm (Appendix IV A). Dissolve an accurately weighed quantity of ketotifen fumarate CRS in water to produce a solution of 7 μ g per ml, measure the absorbance in the same manner. Calculate the content of $C_{19}H_{19}NOS$, by multiplying by 0.7272.

Category As described under Ketotifen Fumarate.

Strength 5 ml : 2.5 mg (calculated with reference to $C_{19}H_{19}NOS$)

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Ketotifen Fumarate Nasal Drops

Ketotifen Fumarate Nasal Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ketotifen fumarate ($C_{19}H_{19}NOS \cdot C_4H_4O_4$).

Description A clear, colourless to pale yellow liquid.

Identification (1) To about 3 ml, add 1 ml of dinitrophenylhydrazine TS, heat on a water bath, a red loose precipitate is produced.

(2) The light absorbance of the solution obtained under the Assay exhibits maximum at 301 nm (Appendix IV A).

pH value 4.0-6.0 (Appendix VI H).

Colour Colourless liquid; any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A).

Other requirements Comply with the general requirements for nasal preparations (Appendix I R).

Assay Dilute a quantity, accurately measured, with water to produce a solution of 15 μ g per ml. Measure the absorbance of the solution at 301 nm (Appendix IV A). Repeat the operation, weigh a quantity of Ketotifen Fumarate CRS, calculate the content of $C_{19}H_{19}NOS \cdot$

$C_4H_4O_4$.

Category As described under Ketotifen Fumarate.

Strength 10 ml : 15 mg (calculated as $C_{19}H_{19}NOS$)

Storage Preserve in tightly closed containers, protected from light.

Ketotifen Fumarate Oral Solution

Ketotifen Fumarate Oral Solution is a solution of Ketotifen fumarate containing sugar. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Ketotifen Fumarate, calculated on the basis of Ketotifen ($C_{19}H_{19}NOS$).

Description A yellow viscous liquid; taste, sweetish.

Identification (1) To 10 ml of the solution add 10 ml of 45% sodium hydroxide solution and 10 ml of *n*-hexane, shake thoroughly, allow to separate into two layers; transfer the *n*-hexane layer into a porcelain dish, evaporate to dryness on a water bath. Allow to cool and add 1 ml of dinitrophenylhydrazine TS, heat in a water bath, a red loose precipitate is produced gradually.

(2) The light absorption of the solution obtained under the Assay exhibits maximum at 294 nm (Appendix IV A).

Relative density 1.20-1.30 (Appendix VI A).

pH value 3.0-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for oral solutions (Appendix I O).

Assay Weigh accurately a quantity of the solution equivalent to about 0.5 mg of ketotifen to a separator, add 10 ml of saturated sodium chloride solution and 10 ml of 45% sodium hydroxide solution, mix well. Add 50 ml of *n*-hexane accurately measured, shake for 30 minutes and allow to separate into two layers. Measure the absorbance of the supernatant at 294 nm (Appendix IV A). Dissolve a quantity of ketotifen fumarate CRS, accurately weighed in an amber coloured volumetric flask, dilute with water to produce a solution of 0.3 mg per ml. Measure accurately 2 ml, carry out the method as described above beginning at the words "to a separator", calculate the content of $C_{19}H_{19}NOS$. Then measure a quantity of the solution and determine the weight of per ml by a pycnometer, convert to the content of $C_{19}H_{19}NOS$ to per ml, calculate the percentage equivalent to that of the labelled amount.

Category As described under Ketotifen Fumarate.

Strength 5 ml : 1 mg (Calculated as $C_{19}H_{19}NOS$)

Storage Preserve in tightly closed containers, protected from light.

Ketotifen Fumarate Tablets

Ketotifen Fumarate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ketotifen fumarate, calculated on the basis of ketotifen ($C_{19}H_{19}NOS$).

Description White or almost white tablets.

Identification (1) Dissolve a quantity of the finely powdered tablets equivalent to about 20 mg of ketotifen in 10 ml of water, stir thoroughly and filter. Concentrate 2 ml of the filtrate on a water bath to about 1 ml, cool, add 1 ml of

sulfuric acid, a pale yellow colour is produced, and disappears on dilution with 2 ml of water.

(2) To 2 ml of the filtrate obtained under the Identification (1) add 1 ml of dinitrophenyl hydrazine TS, heat on a water bath, a red loose precipitate is produced gradually.

(3) The light absorption of the solution obtained under the Assay exhibits a maximum at 301 nm (Appendix IV A).

Content uniformity Use 1 tablets, carry out the method described under Assay beginning at the words "in a 100 ml volumetric flask". The results comply with the requirements (Appendix X E).

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 200 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml after exact 30 minutes and filter. Measure the absorbance of the successive filtrate at 301 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{19}NOS$ from each tablet, taking 465 as the value of A (1%, cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve a quantity of the powdered tablets equivalent to about 1 mg of ketotifen in a 100 ml volumetric flask with water by shaking, dilute with water to volume, mix well and filter. Measure the absorbance of the successive filtrate at 301 nm (Appendix IV A), calculate the content of $C_{19}H_{19}NOS$, taking 465 as the value of A (1%, 1 cm).

Category As described under Ketotifen Fumarate.

Strength 1 mg (Calculated as $C_{19}H_{19}NOS$)

Storage Preserve in tightly closed containers, protected from light.

Kitasamycin

(Leucomycin)

Kitasamycin A₁: R₁ = H R₂ = COCH₂CH(CH₃)₂

R₃ = H R₄ = H

Kitasamycin A₃: R₁ = COCH₃ R₂ = COCH₂CH(CH₃)₂

R₃ = H R₄ = H

Kitasamycin A₄: R₁ = H R₂ = COCH₂CH₂CH₃

R₃ = H R₄ = H

Kitasamycin A₅: R₁ = COCH₃ R₂ = COCH₂CH₂CH₃

R₃ = H R₄ = H

Kitasamycin A₆: R₁ = H R₂ = COCH₂CH₃

R₃ = H R₄ = H

Kitasamycin A₇: R₁ = COCH₃ R₂ = COCH₂CH₃

R₃ = H R₄ = H

Kitasamycin A₈: R₁ = COCH₃ R₂ = COCH₃

R₃ = H R₄ = H

Kitasamycin A₉: R₁ = H R₂ = COCH₃

R₃ = H R₄ = H

Kitasamycin A₁₃: R₁ = H R₂ = COCH₂CH₂CH₂CH₂CH₃

R₃ = H R₄ = H

Kitasamycin is a mixture mainly containing Kita-

samycin A₅, Kitasamycin A₄, Kitasamycin A₁ and Kitasamycin A₁₃. It has a potency of not less than 1300 Kitasamycin Units per mg, calculated on the anhydrous basis.

Description A white or almost white powder; taste; bitter. Very soluble in methanol, ethanol, acetone, chloroform or ether; Very slightly soluble in water; Insoluble in petroleum ether.

Identification (1) To about 10 mg add 5 ml of Sulphuric acid and shake slight, a reddish-brown colour is produced. (2) The retention time of the A₅, A₄, A₁₁, A₁₃ peaks of Kitasamycin in the substance being examined in the chromatogram obtained in the test for Kitasamycin components are identical with those of the four principal peaks of kitasamycin CRS in the chromatogram of the reference solution correspondingly.

Alkalinity Dissolve 0.1 g in 100 ml of water, shake and make it dissolve, pH 8.0-10.0 (Appendix VI H).

Water Not more than 3.0% (Appendix VII M, method 1 A).

Residue on ignition Not more than 0.5% (Appendix VII N), using 1.0 g.

Kitasamycin components Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L ammonium acetate-methanol-acetonitrile (40 : 55 : 5) as the mobile phase. The column temperature is about 60°C, detection wavelength is 231 nm. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of kitasamycin A₅. The resolution factor between the adjacent peaks is not less than 1.0.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a solution containing 2 mg of kitasamycin per ml, mix well and filter. Inject 10 µl of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity in mobile phase to produce a solution containing 2 mg of kitasamycin CRS per ml, as reference solution (1); Transfer 5 ml of the solution into a 25 ml volumetric flask, dilute with mobile phase to volume and mix well, as reference solution (2). Repeat the operation, using reference solution (1) and reference solution (2) instead of the substance being examined. The retention times of kitasamycin active principal peaks are in this order: A₉, A₈, A₇, A₆, A₅, A₄, A₁, A₃ and A₁₃. Calculate the sum content of the main contents compare with the peak area of kitasamycin A₅ by the external standard method. The content of kitasamycin A₅ is 35%-70%, kitasamycin A₄ is 5%-25%, kitasamycin A₁, A₁₃ is 3%-15% respectively. The sum content of the kitasamycin A₉, A₈, A₇, A₆, A₅, A₄, A₁, A₃ and A₁₃ is not less than 85%.

Assay Dissolve an accurately weighed quantity in ethanol (using 1 ml of ethanol for 2 mg), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A).

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place, protected from light.

Preparation Kitasamycin Tablet

Kitasamycin Tablets

... my i T bl ... o tai ... ot less than 90.0% and not more than 110.0% of the labelled amount of kitasamycin.

Description Sugar coated or film coated tablets with white or almost white core.

Identification (1) To a quantity of powdered tablets equivalent to about 10000 Units of kitasamycin, add 5 ml of Sulphuric acid and shake slightly, a reddish-brown colour is produced. (2) The retention times of the A_5 , A_4 , A_{11} , A_{13} peaks of Kitasamycin in the substance being examined in the chromatogram obtained in the test for kitasamycin components are identical with those of the four principal peaks of kitasamycin CRS in the chromatogram of the reference solution correspondingly.

Kitasamycin components Dissolve an accurately weighed quantity of powdered tablets in mobile phase to produce a solution of 2500 kitasamycin Units per ml, mix well and filter, carry out the test for Kitasamycin components described under Kitasamycin. The content of kitasamycin A_5 is 35%-70%, kitasamycin A_4 is 5%-25%, kitasamycin A_1 , A_{13} is 3%-15% respectively, calculated by the formula:
The content of Kitasamycin A_5 (A_4 , A_1 , A_{13})% =

$$\frac{A_T W_S \times \text{average weight} \times P \times \text{potency of kitasamycin CRS}}{A_S W_T \times \text{the labeled amount}} \times 100\%$$

Where A_T is the peak area of the kitasamycin A_5 (A_4 , A_1 , A_{13}) in the chromatogram;

A_S is the peak area of the kitasamycin A_5 CRS;

W_T is the weight of the substance being examined;

W_S is the weight of the kitasamycin CRS;

P is the percent content of the acetylspiramycin A_5 CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of phosphate BS (pH 5.0) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution at exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 20 μ g per ml. Triturate 10 tablets, to an accurately weighed quantity equivalent to about the average weight of one tablet add a quantity of ethanol (using 1 ml of ethanol for 2 mg of the labelled amount of kitasamycin) to make kitasamycin dissolve, dilute with the dissolution medium to produce a solution of 100 μ g per ml and filter. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 20 μ g per ml. Measure the absorbance of the resulting solutions at 231 nm (Appendix IV A), calculate the dissolution of kitasamycin from each tablet. Not less than 80% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 10 tablets, weighed quantity in ethanol (using 1 ml of ethanol for 2 mg), dilute with sterile water to produce a solution of 1000 Units per ml, mix well and allow to stand. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Kitasamycin (Appendix VI A).

Category As described under Kitasamycin.

Strength 100000 units

Storage Preserve in tightly closed containers, stored in a dry place, protected from light.

Lactic Acid

$C_3H_6O_3$ 90.08

[50-21-5]

Lactic Acid is a mixture of 2-hydroxypropionic acid and its condensation products. It contains not less than 85.0% and not more than 90.0% of $C_3H_6O_3$ (g/g).

Description A clear colourless to pale yellow, viscous liquid; almost odourless; taste, slightly sour; hygroscopic. The aqueous solution exhibits acidic reaction. Miscible with water, ethanol or ether; insoluble in chloroform.

Relative density 1.20-1.21 (Appendix VI A).

Identification To the aqueous solution add potassium permanganate TS and heat, characteristic odour of acetaldehyde is evolved.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 3.0 g. Any opalescence produced is not more pronounced than that of a reference using 6.0 ml of sodium chloride standard solution (0.002%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.010%).

Citric, oxalic, phosphoric or tartaric acid To 0.5 g add a quantity of water to produce 5 ml, mix well, make it slightly alkaline with ammonia TS, add 1 ml of calcium chloride TS, heat in a water bath for 5 minutes. No opalescence is produced.

Readily carbonizable substances Transfer 5 ml of 95% (g/g) sulfuric acid to a clean test tube and add 5 ml of the substance being examined along the wall of test tube to form two layers, allow to stand for 15 minutes at 15°C. The colour of the interface between two layers is not more intense than pale yellow.

Reducing sugar Mix 0.5 g with 10 ml of water, neutralize with 20% sodium hydroxide solution, add 6 ml of alkaline cupric tartrate TS and boil for 2 minutes, no red precipitate is produced.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Calcium salts Dissolve 1.0 g in 10 ml of water, neutralize the solution with ammonia TS, add a few drops of ammonium oxalate, no opalescence is produced.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals To 2.0 g add 10 ml of water and 1 drop of phenolphthalein IS, add dropwise ammonia TS until the colour of solution becomes pink, add 3 ml of dilute hydrochloric acid and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dilute 2.0 g with 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix

VIII J method 1); not more than 0.0001%.

Assay Weigh accurately about 1 g, add 50 ml of water and 25 ml of sodium hydroxide (1 mol/L) VS, accurately measured, boil for 5 minutes. Add 2 drops of phenolphthalein IS, titrate with sulfuric acid (0.5 mol/L) VS while hot. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 90.08 mg of $C_6H_{13}O_2$.

Category Antiseptic, disinfectant.

Storage Preserve in tightly closed containers.

Lactulose Oral Solution

Lactulose Oral Solution is a sterile solution of lactulose. It contains not less than 90.0% and not more than 110.0% of the labelled amount of lactulose ($C_{12}H_{22}O_{11}$).

Description A clear, brownish-yellow viscous liquid.

Identification (1) To 5 ml of hot alkaline cupric tartrate TS add dropwise 5% aqueous solution, a red precipitate of cuprous oxide is produced.

(2) The retention time of principal peaks of the lactulose in the substance being examined in the chromatogram obtained in the Assay are identical with that the principal peak of lactulose CRS in the chromatogram of the reference solution.

Relative density 1.260-1.390 (Appendix VI A).

pH value 3.0-7.0 (Appendix VI H) after 15 minutes of contact with the electrodes.

Related substances Calculate the results from the Assay. It contains not more than 18.0% of lactose, not more than 12.0% of galactose and not more than 2.0% of fructose.

Residue on ignition Not more than 0.3% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Other requirements Complies with the general requirements for oral solutions (Appendix I O), and the Salmonella is not detected.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with aminopropylsilyl silica gel and a mixture of acetonitrile-water (77 : 23) as the mobile phase, detect with differential refractive index detector.

Procedure Transfer an accurately measured quantity of the oral solution equivalent to about 1 g of lactulose in a 50 ml volumetric flask by a "to contain" pipet. Wash the pipet and dilute to volume with water. Inject 10 μ l of the solution into the column, record the chromatogram. Weigh accurately about 500 mg of lactulose CRS, 180 mg of lactose CRS, 100 mg of galactose CRS and 20 mg of fructose CRS that previously dried at 60°C under reduced pressure for 16 hours. Transfer to a 25 ml volumetric flask, dissolve and dilute with water to volume, mix well. Repeat the operation, using these reference solutions, calculate the content of $C_{12}H_{22}O_{11}$ by the external standard method.

Category Hypoammoniaemic and laxative.

Strength (1) 10 ml : 5 g (2) 100 ml : 50 g
(3) 100 ml : 66.7 g

Storage Preserve in tightly closed containers, protected

from light.

Leucine

$C_6H_{13}NO_2$ 131.17

[61-90-5]

Leucine is (L)-2-amino-4-methylpentanoic acid. It contains not less than 98.5% of $C_6H_{13}NO_2$, calculated on the dried basis.

Description White crystals or a white crystalline powder; odourless; taste, slightly bitter. Freely soluble in formic acid; sparingly soluble in water; very slightly soluble in ethanol or ether.

Specific optical rotation +14.5° to +16.0°, in a solution of 40 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Leucine (Appendix XVI).

Acidity Heat to dissolve 0.50 g in 50 ml of water, cool to room temperature. pH 5.5-6.5 (Appendix VI H).

Transmittance of solution Heat to dissolve 0.50 g in 50 ml of water, cool to room temperature. The transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-water-glacial acetic acid (3 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions of the substance being examined in water containing (1) 4 mg per ml, (2) 20 μ g per ml. After developing and removal of the plate, dry it in air and spray with ninhydrin solution (dissolve 1g ninhydrin in 50 ml of acetone) and heat at 80°C until the colour is produced and examine immediately. Any spot other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.5 g. Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Dissolve 2.0 g in 5 ml of water, add 1 ml of sulfuric acid and 10 ml of sulfite acid, evaporate to about 2 ml on a water bath, add 5 ml of water, add dropwise ammonia TS until phenolphthalein IS changes the colour. Add 5 ml of hydrochloric acid and sufficient water to produce 28 ml. Carry out the limit test for arsenic (Appendix VII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 25 EU per g of leucine (for parenteral administration).

Assay Dissolve about 0.1 g, accurately weighed, in 1 ml of dehydrated formic acid, add 25 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.12 mg of $C_{11}H_{12}N_2S$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Levamisole Hydrochloride

$C_{11}H_{12}N_2S \cdot HCl$ 240.76 [16595-80-5]

Levamisole Hydrochloride is (S)-(-)-6-phenyl-2,3,5,6-tetrahydroimidazo [2,1-b] thiazole hydrochloride. It contains not less than 98.5% of $C_{11}H_{12}N_2S \cdot HCl$, calculated on the dried basis.

Description White or almost white, needle crystals or a crystalline powder; odourless; taste, bitter. Very soluble in water; freely soluble in ethanol; slightly soluble in chloroform; very slightly soluble in acetone.

Melting range 225-230°C (Appendix VI C).

Specific optical rotation Not less than -121.5° , in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 60 mg in 20 ml of water, add 2 ml of sodium hydroxide TS, boil for 10 minutes and cool, add a few drops of sodium nitroprusside TS; a red colour is produced, which fades on standing.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of levamisole hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity of solution A solution of 2.0 g in 50 ml of freshly boiled and cooled (20-25°C) water is clear; any opalescence produced is not more pronounced than that of a reference suspension 2 (Appendix IX B).

Acidity The solution obtained in the test for Clarity of solution, pH 3.5-5.0 (Appendix VI H).

Light absorption The absorbance of a solution of 1 mg in 1 ml of methanolic hydrochloric acid (0.2 mol/L) VS (Appendix IV A) is not greater than 0.20, measured at 310

nm.

2-Iminothiazolidine derivatives Dissolve 50 mg in a mixture of 10 ml of dilute ethanol and 25 ml of water, add 5 ml of ammonia TS and heat at 50°C in a water bath for 5 minutes; Add 2 ml of silver nitrate TS and a sufficient quantity of water to produce 50 ml, mix well, heat at 50°C in a water bath for 10 minutes. Any opalescence produced is not more pronounced than that of a reference solution (to 2 ml of sodium chloride standard solution add water to produce 40 ml; add 1 ml of nitric acid and 1 ml of silver nitrate TS, dilute with water to 50 ml, mix well and allow to stand in a dark place for 5 minutes).

2,3-Dihydro-6-phenylimidazo [2,1-b] thiazole hydrochloride Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-methanol-glacial acetic acid (45 : 8 : 4) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in methanol containing (1) 0.10 g per ml of the substance being examined, (2) 0.50 mg per ml of 2,3-dihydro-6-phenylimidazo [2,1-b] thiazole hydrochloride CRS. After developing and removal of the plate, dry it in air and visualize with iodine vapour. Any spot other than the principal spot in the chromatogram obtained with solution (1), is not more intense than that of the principal spot in the chromatogram obtained with solution (2) (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml ethanol. Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 24.08 mg of $C_{11}H_{12}N_2S \cdot HCl$.

Category Anthelmintics. Biological response modifier.

Storage Preserve in tightly closed containers.

Preparation (1) Levamisole Hydrochloride Enteric-coated Tablets
(2) Levamisole Hydrochloride Granules
(3) Levamisole Hydrochloride Syrup
(4) Levamisole Hydrochloride Tablets

Levamisole Hydrochloride Enteric-coated Tablets

Levamisole Hydrochloride Enteric-coated Tablets contains not less than 90.0% and not more than 110.0% of the labelled amount of levamisole hydrochloride ($C_{11}H_{12}N_2S \cdot HCl$).

Description Enteric-coated tablets, with white core.

Identification A quantity of the powdered tablets with enteric-coating removed complies with the tests for Identification described under Levamisole Hydrochloride Tablets.

Drug Release Comply with the drug release test [Appendix X D method 2 (1)], using the apparatus of dissolution test method L. Adjust the rotational speed of the basket to 100 rpm. The rotational time in buffer solution is 60 minutes. To 3.0 ml of the filtrate accurately measured released in the acid solvent add 1.0 ml of 0.2 mol/L sodium phosphate solution, mix well, use as the test preparation (1), the filtrate released in the buffer solution as the test preparation (2). Weigh accurately a quantity of levamisole hydrochloride

CRS, dissolve in a phosphate BS ($\text{pH } 6.8 \pm 0.05$) [measure 750 ml of hydrochloric acid solution ($9 \rightarrow 1000$), add 250 ml of 0.2 mol/L sodium phosphate solution, adjust pH to 6.8 ± 0.05] to produce a solution of 25 μg per ml as the reference preparation. Transfer accurately 2 ml each of the above three solution to three separators. To each separator add 3.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green in 50 ml of 0.2 mol/L potassium hydrogen phthalate solution, adjust to pH 4.5 with 0.2 mol/L sodium hydroxide solution and dilute with water to 100 ml, mix well, filter if necessary], mix well, shake with 10 ml of chloroform for 1 minutes. Allow to stand until the mixture separates into two layers. Measure the absorbance of the chloroform layer at 420 nm (Appendix IV A). Calculate the amount of $\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$ dissolved from each tablet, the results comply with the requirements.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with enteric-coating removed. Weigh accurately a quantity of the powder equivalent to about 0.2 g of levamisole hydrochloride to a separator, add 10 ml of water, shake to dissolve levamisole hydrochloride. Add 5 ml of sodium hydroxide TS and shake gently, extract with 50 ml of chloroform measured accurately, filter the chloroform layer with dry filter paper and discard the initial filtrate. To 25 ml of the successive filtrate, accurately measured, add 15 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.08 mg of $\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$.

Category As described under Levamisole Hydrochloride.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers.

Levamisole Hydrochloride Granules

Levamisole Hydrochloride Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of Levamisole Hydrochloride ($\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$).

Description Water soluble granules.

Identification (1) Place a quantity of the powder equivalent to about 0.1 g levamisole hydrochloride in a separator, add 25 ml of water and shake to dissolve levamisole hydrochloride. Add 3 ml of sodium hydroxide TS and 10 ml of chloroform and shake gently. Separate the chloroform layer and evaporate it on a water bath to dryness. Dissolve the residue in 2 ml of dilute hydrochloric acid, add 20 ml of water and 3 ml of sodium hydroxide TS, boil for 10 minutes and allow to cool, add a few drops of sodium nitroprusside TS; a red colour is produced, which fades on standing. (2) Dissolve 1 g of the granules with 10 ml of water, the aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Loss on drying When dried to constant weight at 105°C , losses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Weigh accurately and powder a quantity of well mixed contents obtained in test for weight variation of contents equivalent to about 0.2 g of levamisole hydrochloride into a

separator. Add 10 ml of water, shake to dissolve levamisole hydrochloride. Add 5 ml of sodium hydroxide TS and shake gently, extract with 50 ml of chloroform measured accurately, filter the chloroform layer with dry filter paper and discard the initial filtrate. To 25 ml of the successive filtrate, accurately measured, add 15 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.08 mg of $\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$.

Category As described under Levamisole Hydrochloride.

Strength 10 g : 50 mg

Storage Preserved in tightly closed containers, stored in a cool and dry place.

Levamisole Hydrochloride Syrup

Levamisole Hydrochloride Syrup contains not less than 90.0% and not more than 110.0% of the labelled amount of levamisole hydrochloride ($\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$).

Description A clear, brown viscous liquid; taste, sweetish.

Identification To 10 ml of the syrup add 4 ml of sodium hydroxide TS and 30 ml of chloroform, shake thoroughly, allow to separate into two layers; evaporate the chloroform layer to dryness, dissolve the extract with water, add 2 ml of sodium hydroxide TS, boil for 10 minutes and cool (filter if necessary), add a few drops of sodium nitroprusside TS; a red colour is produced, which fades on standing.

Relative density 1.20-1.30 (Appendix VI A).

Other requirements Complies with the general requirements for syrups (Appendix I K).

Assay Measure accurately 25 ml of the syrup with a to contain pipet to a separator, wash the inner wall of the pipet with a quantity of water. Add 10 ml of water, shake to dissolve levamisole hydrochloride. Add 5 ml of sodium hydroxide TS and shake gently, extract with 50 ml of chloroform measured accurately, filter the chloroform layer with dry filter paper and discard the initial filtrate. To 25 ml of the successive filtrate, accurately measured, add 15 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.05 mol/L) VS or (0.02 mol/L) VS for strength (10 ml : 20 mg) until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS or (0.02 mol/L) VS is equivalent to 12.04 mg or 4.815 mg of $\text{C}_{11}\text{H}_{12}\text{N}_2\text{S} \cdot \text{HCl}$.

Category As described under Levamisole Hydrochloride.

Strength (1) 10 ml : 20 mg (2) 100 ml : 0.8 g
(3) 500 ml : 4.0 g (4) 2000 ml : 16.0 g

Storage Preserved in tightly closed containers, protected from light.

Levamisole Hydrochloride Tablets

Levamisole Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of levamisole hydrochloride

($C_{11}H_{12}N_2S \cdot HCl$).

Description White tablets or sugar-coated tablets.

Identification To a quantity of the powder equivalent to about 0.15 g of levamisole hydrochloride add 50 ml of water, shake to dissolve levamisole hydrochloride and filter; the filtrate complies with tests (1) and (3) for Identification described under Levamisole Hydrochloride.

Dissolution Comply with the dissolution test (Appendix X C, method 1), using 900 ml of water as dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. The successive filtrate is used as the test solution. Dissolve a quantity of levamisole hydrochloride CRS, weighed accurately, in water to produce a reference solution of 0.4 mg per ml. Measure accurately 1.0 ml, 2.0 ml, 3.0 ml, 4.0 ml and 5.0 ml of the reference solution to 100 ml volumetric flasks separately, dilute with 0.1 mol/L sodium hydroxide solution to their volumes and mix well. Measure the primary derivative curves of the resulting solutions at 220–250 nm and the value D on zero-amplitude of the peaks separately and perform a blank measure with 0.1 mol/L sodium hydroxide. Calculate the regression equation between the value D and the concentration C. Measure accurately 5.0 ml of the test solution to 10 ml (for strength 25 mg) or 20 ml (for strength 50 mg) volumetric flask, dilute to volume with 0.2 mol/L sodium hydroxide solution and mix well. Measure the primary derivative curve of the resulting solution and the value D on zero-amplitude of the peak, and calculate the dissolution of $C_{11}H_{12}N_2S \cdot HCl$ from each tablet with the regression equation. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. Weigh accurately a quantity of the powder equivalent to about 0.2 g of levamisole hydrochloride to a separator, add 10 ml of water, shake to dissolve levamisole hydrochloride; add 5 ml of sodium hydroxide TS and shake gently. Extract with 50 ml of chloroform measured accurately, filter the chloroform layer with dry filter paper and discard the initial filtrate. To 25 ml of the successive filtrate, accurately measured, add 15 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.08 mg of $C_{11}H_{12}N_2S \cdot HCl$.

Category As described under Levamisole Hydrochloride.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers.

Levodopa

$C_9H_9NO_4$ 197.19

[59-92-7]

Levodopa is 3-hydroxy-L-tyrosine. It contains not less than 98.0% of $C_9H_9NO_4$, calculated on the dried basis.

Description A white or almost white crystalline powder, odourless; tasteless.

Slightly soluble in water; insoluble in ethanol, chloroform or ether; freely soluble in dilute acids.

Specific optical rotation -159° to -168° (Appendix VI E). To about 0.2 g, accurately weighed, in a 25 ml amber coloured volumetric flask, add 5 g of urotropin and dissolve in a quantity of hydrochloric acid solution (9→100), make up to volume and mix well. Allow the solution to stand for 3 hours, protected from light before the measurement.

Specific absorbance Measure the absorbance of a solution of 30 μ g per ml in hydrochloric acid solution (9→1000) at 280 nm (Appendix IV A), the value of A (1%, 1 cm) is 136–146.

Identification (1) Dissolve about 5 mg in 5 ml of hydrochloric acid solution (9→1000), add 2 drops of ferric chloride TS; a green colour is produced. To 2.5 ml of the solution add an excess of dilute ammonia solution; a purple colour is produced. To the remainder of the solution add an excess of sodium hydroxide TS; a red colour is produced.

(2) Dissolve about 5 mg in 5 ml of water, add 1 ml of 1% ninhydrin solution and warm in a water bath; the solution becomes purple gradually.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of levodopa (Appendix XVI).

Clarity and colour of acid solution A solution of 0.4 g in 10 ml of hydrochloric acid solution (9→100) is clear. Any colour produced is not more intense than that of reference solution YG₂ or Y₂ (Appendix IX A, method 1).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference using 6.0 ml of sodium chloride standard solution (0.02%).

Foreign amino acids Carry out the method for thin-layer chromatography (Appendix V B), using microcrystalline cellulose (0.15 g/10 cm²) as the coating substance and nbutanol-glacial acetic acid-water (2 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of three solutions in hydrochloric acid solution (9→1000) containing (1) 10 mg per ml, (2) 0.10 mg per ml of the substance being examined and (3) 10 mg of the substance being examined and 0.10 mg of L-tyrosine per ml. After developing and removal of the plate, dry it in air and spray with a mixture of 10% ferric chloride solution and 5% potassium ferricyanide solution (1 : 1), freshly prepared. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2), while spots corresponding to levodopa and tyrosine are both present in the chromatogram obtained with solution (3).

Loss on drying When dried to constant weight at 105°C loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N) using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in 2 ml of anhydrous formic acid, add 20 ml of glacial acetic acid and mix well, add 2 drops of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until a green colour is obtained. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.72 mg of $C_9H_9NO_4$.

Category Anti-Parkinsonian agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Levodopa Capsules
(2) Levodopa Tablets

Levodopa Capsules

Levodopa Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of levodopa ($C_9H_{11}NO_4$).

Description Capsules containing white or almost white granules or powder.

Identification The contents of capsules comply with the test (1) and (2) for Identification described under Levodopa.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with the same dissolution medium to volume and mix well. Measure the absorbance of the resulting solution at 280 nm (Appendix IV A) and calculate the dissolution of $C_9H_{11}NO_4$ from each capsule, taking 141 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of mixed contents obtained in the test for weight variation of contents equivalent to about 30 mg of levodopa and carry out the Assay described under Levodopa Tablets beginning at the words "to a 100 ml volumetric flask . . .", calculate the content of $C_9H_{11}NO_4$.

Category As described under Levodopa.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Levodopa Tablets

Levodopa Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of levodopa ($C_9H_{11}NO_4$).

Description White or almost white tablets or film coated tablets with white or almost white core.

Identification Comply with tests (1) and (2) for Identification described under Levodopa, using a quantity of the powdered tablets.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 10 ml volumetric flask (for strength 50 mg), to a 25 ml volumetric flask (for strength 125 mg) or to a 50 ml volumetric flask (for strength 250 mg). Dilute with the same dissolution medium to volume and mix well. Measure the absorbance of the resulting solution at 280 nm (Appendix IV A). Calculate the

dissolution of $C_9H_{11}NO_4$ from each tablet, taking 141 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 30 mg of levodopa in a 100 ml volumetric flask add a quantity of hydrochloric acid solution (9→1000), shake well and then add hydrochloric acid solution (9→1000) to volume, mix well and filter. Discard the initial filtrate, measure accurately 10 ml of the successive filtrate to another 100 ml volumetric flask, add hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance of the resulting solution at 280 nm (Appendix IV A), calculate the content of $C_9H_{11}NO_4$, taking 141 as the value of A (1%, 1 cm).

Category As described under Levodopa.

Strength (1) 50 mg (2) 125 mg (3) 250 mg

Storage Preserve in tightly closed containers, protected from light.

Levodopa and Benserazide Hydrochloride Capsules

Levodopa and Benserazide Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of levodopa ($C_9H_{11}NO_4$) and benserazide hydrochloride ($C_{10}H_{15}N_3O_5 \cdot HCl$) respectively.

Identification (1) Shake about 0.5 g of the contents with 10 ml of water, filter. The filtrate complies with tests (1) for Identification described under Benserazide Hydrochloride. The residue complies with tests (2) for Identification described under Levodopa.

(2) The retention time of principal peaks of the benserazide hydrochloride and levodopa in the substance being examined in the chromatogram obtained in the Assay are identical with that of the principal peaks of benserazide hydrochloride CRS and levodopa CRS in the chromatogram of the reference solution correspondingly.

Loss on drying When dried to constant weight under reduced pressure in a desiccator over phosphorus pentoxide, the contents of the capsules being examined lose not more than 1.0% of their weight (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of trifluoroacetic acid-methanol-water (1 : 20 : 1000) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of benserazide hydrochloride. The resolution factor between the peaks of levodopa and benserazide hydrochloride complies with the related requirements.

Procedure Dissolve a quantity of the mixed contents obtained in weight variation equivalent to 15 mg of benserazide hydrochloride and 20 mg of levodopa respectively, accurately weighed, in a 50 ml amber coloured volumetric flask with mobile phase and dilute to volume, shake well. Filter and inject 10 μ l of the successive filtrate into the column, record the peak areas

correspondingly obtained in the chromatogram. Repeat the operation, using benserazide hydrochloride CRS and levodopa CRS instead of the substance being examined. Calculate the contents of $C_9H_{11}NO_4$ and $C_{10}H_{15}N_3O_5 \cdot HCl$ respectively with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Levodopa.

Strength (1) levodopa 100 mg and benserazide 25 mg (equivalent to 28.5 mg of benserazide hydrochloride)
(2) levodopa 200 mg and benserazide 50 mg (equivalent to 57 mg of benserazide hydrochloride)

Storage Preserve in tightly closed containers, protected from light, stored in a cool and dry place.

Levodopa and Benserazide Hydrochloride Tablets

Levodopa and Benserazide Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amounts of levodopa ($C_9H_{11}NO_4$) and benserazide hydrochloride ($C_{10}H_{15}N_3O_5 \cdot HCl$).

Description Pale red tablets (containing colouring matter).

Identification (1) Triturate 1 tablet with 10 ml of water, shake well and filter. To 2 ml of the filtrate in a clean test tube, add 1 ml of ammoniacal silver nitrate TS, a brown colour is produced; silver is reduced and deposited as a mirror on the wall of tube when heated in a water bath. Dilute another 1 ml of the filtrate with water to 20 ml. To 5 ml of the solution add 1 ml of 1% ninhydrin solution and warm in a water bath, the solution becomes purple gradually.

(2) ... e. n. n. ... e. ... p. n. c. p. ... e. n. e. ... hydrochloride and levodopa in the substance being examined in the chromatogram obtained in the Assay are identical with those of the principal peaks of benserazide hydrochloride CRS and levodopa CRS in the chromatogram of the reference solution correspondingly.

DL-Serinhydrazide hydrochloride an DL-2-amino-N', N'- is (2,3,4-trihydroxybenzyl) hydracrylohydrazide hydrochloride Proceed as described in the Assay. Calculate the contents of DL-serinhydrazide hydrochloride (impurity A) and DL-2-amino-N', N'-bis (2,3,4-trihydroxybenzyl) hydracrylohydrazide hydrochloride (impurity B) respectively with respect to the peak height of impurity A and the peak area of impurity B obtained in the chromatogram by the external standard method. Impurity A and impurity B are not more than 2.0% and 3.0% of the labelled amount of benserazide hydrochloride ($C_{10}H_{15}N_3O_5 \cdot HCl$) respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate-methanol-acetonitrile (70.5 : 25 : 4.5) (containing 0.005 mol/L sodium decane-sulfonate, adjusted to pH 3.5 with phosphoric acid) as the mobile phase. Detection wavelength is 270 nm for levodopa, and then changed to 220 nm after elution of levodopa peak. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of benserazide hydrochloride. The resolution factor among the peaks of levodopa, impurity A, benserazide hydrochloride and impurity

B complies with the related requirements.

Procedure Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets equivalent to 100 mg of levodopa and 28.5 mg of benserazide hydrochloride into a 200 ml volumetric flask, add 180 ml of mobile phase, treat in an ultrasonic bath for 2 minutes, shake for 15 minutes, dilute with mobile phase to volume, mix well and filter. Use the successive filtrate as test solution. Inject 20 μ l of the test solution into the column immediately, and record the chromatogram. Dissolve separately a quantity of impurity A CRS and impurity B CRS, both accurately weighed, in mobile phase to produce solutions both of 0.285 mg per ml as impurity A reference solution and impurity B reference solution. Weigh accurately about 100 mg of levodopa CRS and about 28.5 mg CRS of benserazide hydrochloride CRS into the same 200 ml volumetric flask, add a quantity of mobile phase, shake until dissolved, add 2 ml of impurity A reference solution and 3 ml of impurity B reference solution, both accurately measured, dilute with mobile phase to volume and mix well. Use the resulting solution as reference solution. Inject 20 μ l of the reference solution into the column immediately, and record the chromatogram. Calculate the contents of $C_9H_{11}NO_4$ and $C_{10}H_{15}N_3O_5 \cdot HCl$ respectively with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Levodopa.

Strength levodopa 200 mg and benserazide 50 mg (equivalent to benserazide hydrochloride 57 mg)

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Levonorgestrel

$C_{21}H_{28}O_2$ 312.47

[797-63-7]

Levonorgestrel is D (-)-13-ethyl-17 β -hydroxy-18, 19-dinor-17 α -pregn-4-en-20-yn-3-one. It contains not less than 97.0% and not more than 103.0% of $C_{21}H_{28}O_2$.

Description A white or almost white crystalline powder; odourless; tasteless. Soluble in chloroform; slightly soluble in methanol; insoluble in water.

Melting range 233-239°C, melting within 5°C (Appendix VI C).

Specific optical rotation -30°C to -35°C in a solution of 20 mg per ml in chloroform (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Levonorgestrel (Appendix XVI).

Related substances Carry out the method as described under

Assay. Dissolve a quantity of the substance being examined in the mobile phase to produce a solution of about 75 µg per ml (solution 1), and dilute accurately 2 ml to 100 ml with the mobile phase as solution 2. Inject 20 µl of solution 2 into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. And then inject separately 20 µl each of solution 1 and 2 into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution 1 is not greater than the area of the principal peak obtained with solution 2.

Ethinyl group Dissolve about 100 mg, accurately weighed, in 40 ml of tetrahydrofuran, add 10 ml of 5% silver nitrate solution. Carry out the method for potentiometric titration (Appendix VI A), titrate with sodium hydroxide (0.1 mol/L) VS. Each ml is equivalent to 2.503 mg of ethinyl group ($-\text{C}\equiv\text{CH}$), it contains not less than 7.81% and not more than 8.18% of ethinyl group.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of levonorgestrel. The resolution factor between the peaks of levonorgestrel and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of megestrol acetate with acetonitrile to produce a solution of about 1 mg per ml.

Procedure Dissolve about 7.5 mg of Levonorgestrel CRS, accurately weighed, in the mobile phase in a 50 ml volumetric flask and dilute to volume, mix well. Measure accurately 2 ml each of the above solution and the internal standard solution, mix well. Inject 20 µl of resulting solution into the column. Repeat the operation, using the substance being examined instead of Levonorgestrel CRS, calculate the content of $\text{C}_{21}\text{H}_{28}\text{O}_2$.

Category Progesteroïd.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Compound Levonorgestrel Pills
(2) Compound Levonorgestrel Tablets
(3) Levonorgestrel and Quinestrol Tablets
(4) Levonorgestrel Tablets

Levonorgestrel Tablets

Levonorgestrel Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of levonorgestrel ($\text{C}_{21}\text{H}_{28}\text{O}_2$).

Description White tablets.

Identification (1) To the powder equivalent to 37.5 mg of levonorgestrel add 200 ml of chloroform in portions, stir thoroughly, filter with a sintered glass filter (G_4), wash the residue and the filter with chloroform, combine the filtrates, evaporate the filtrate on a water bath to dryness and allow to cool. Dissolve the residue in 5 ml of chloroform and determine the optical rotation (Appendix VI E). It should be levorotatory, not lower than 0.18° .

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the

reference solution in the chromatogram obtained in Assay.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Dissolve 1 tablet in the volumetric flask (0.75 mg in 5 ml volumetric flask, 1.5 mg in 10 ml volumetric flask). Carry out the method as described under Assay, beginning at the words "dilute with the mobile phase to volume," and calculate the content of $\text{C}_{21}\text{H}_{28}\text{O}_2$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of levonorgestrel. The resolution factor between the peaks of levonorgestrel and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of megestrol acetate, accurately weighed, in acetonitrile to produce a solution of about 1 mg per ml.

Procedure Dissolve a quantity of levonorgestrel CRS, accurately weighed, in acetonitrile to produce a solution of 0.15 mg per ml as reference solution. Mix 2 ml each of the reference solution and the internal standard solution, both measured accurately, shake well. Inject 20 µl of the resulting solution into the column. Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 1.5 mg of levonorgestrel into a 10 ml volumetric flask, add a quantity of the mobile phase, dissolve levonorgestrel by ultrasonic treatment, cool, dilute with the mobile phase to volume, shake well and filter. Mix 2 ml each of the successive filtrate and the internal standard solution, both measured accurately and shake well. Inject 20 µl of the resulting solution into the column, calculate the content of $\text{C}_{21}\text{H}_{28}\text{O}_2$.

Category Progesteroïd.

Strength (1) 0.75 mg (2) 1.5 mg

Storage Preserve in tightly closed containers, protected from light.

Levonorgestrel and Quinestrol Tablets

Levonorgestrel and Quinestrol Tablets contain not less than 90.0% and not more than 115.0% of the labelled amount of levonorgestrel ($\text{C}_{21}\text{H}_{28}\text{O}_2$), and not less than 94.0% and not more than 115.0% of the labelled amount of quinestrol ($\text{C}_{25}\text{H}_{32}\text{O}_2$).

Formula	Levonorgestrel	6 g
	Quinestrol	3 g

To make	1000 tablets
---------	--------------

Description Film coated tablets with white or almost white core.

Identification (1) To a quantity of powdered tablets equivalent to about 150 mg of levonorgestrel, add about 200 ml of chloroform in portions, stir thoroughly, filter in vacuum using G_4 funnel, wash the residue and the filter, combine the filtrate and washings, evaporate on a water bath to dryness, cool, add accurately 20 ml of chloroform, the optical rotation of the resulting solution should be

levorotatory, not lower than 0.18° (Appendix VI E).

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Related substances Measure 2 ml of quineestrol CRS solution obtained in Assay, evaporate on a water bath to dryness, cool, add 2.5 ml of chloroform as solution (1). Measure 2 ml of levonorgestrel CRS solution obtained in Assay, evaporate on a water bath to dryness, cool, add 1 ml of chloroform, as solution (2). Measure 2 ml of the solution obtained in test (1) for Identification, evaporate on a water bath to 1 ml as solution (3). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (96 : 4) as the mobile phase. Apply separately to the plate 15 μ l each of solution (1) and (2), and 12.5 μ l of solution (3), after developing and removal of the plate, dry it in air, spray with a freshly prepared 10% solution of phosphomolybdic acid in ethanol, dry it at 105°C for 10 minutes and examine immediately. Any spot other than the principal spots obtained with solution (3) is not more intense than the principal spot obtained with solution (1) and (2). The colour and position of the two principal spots in the chromatogram obtained with solution (3) correspond to the principal spot obtained with solutions (1) and (2).

Content uniformity Comply with the requirements for content uniformity (Appendix X E).

Carry out the method for Assay, using 1 tablet and beginning at the words "to a 50 ml volumetric flask". Calculate the contents of $\text{C}_{21}\text{H}_{28}\text{O}_2$ and $\text{C}_{25}\text{H}_{32}\text{O}_2$ respectively with respect to the peak area obtained in the chromatogram by the internal standard method.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.8% lauryl sodium sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution after exactly 60 minutes and filter. Take the successive filtrate as the test solution. Dissolve about 30 mg of levonorgestrel CRS and 15 mg of quineestrol CRS, weighed accurately, with mobile phase into a 50 ml volumetric flask and dilute with mobile phase to volume, mix well. Measure accurately 1 ml of the solution into a 100 ml volumetric flask, dilute with the dissolution medium to volume, mix well as the reference solution. Carry out the method as described under Assay. Inject separately 20 μ l of the test solution and the reference solution and record the chromatogram. Calculate the dissolution of $\text{C}_{21}\text{H}_{28}\text{O}_2$ and $\text{C}_{25}\text{H}_{32}\text{O}_2$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. The dissolution of $\text{C}_{21}\text{H}_{28}\text{O}_2$ and $\text{C}_{25}\text{H}_{32}\text{O}_2$ is separately not less than 60% and 80% of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (80 : 20) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of levonorgestrel. The resolution factor between the peaks complies with the related requirements.

Internal standard solution Dissolve a quantity of progesterone caproate in acetonitrile to produce a solution of about 0.12 mg per ml.

Procedure Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 6 mg of levonorgestrel in the mobile phase in a 50 ml

volumetric flask by ultrasonication, cool, dilute with the mobile phase to volume, mix well and filter. Measure accurately 1 ml each of the successive filtrate and the internal standard solution and mix well. Inject 20 μ l into the column, and record the chromatogram. Separately dissolve an accurately weighed quantity of levonorgestrel CRS and quineestrol CRS in the mobile phase to produce a solution of 0.12 mg of levonorgestrel per ml and a solution of 0.06 mg of quineestrol per ml. Measure accurately 1 ml each of the resulting solutions and mix well. Inject 20 μ l into the column and record the chromatogram. Calculate the contents of $\text{C}_{21}\text{H}_{28}\text{O}_2$ and $\text{C}_{25}\text{H}_{32}\text{O}_2$ respectively with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Progesteroide.

Storage Preserve in tightly closed containers, protected from light.

Compound Levonorgestrel Pills

Compound Levonorgestrel Pills contain not less than 90.0% and not more than 115.0% of the labelled amount of levonorgestrel ($\text{C}_{21}\text{H}_{28}\text{O}_2$) and ethinylestradiol ($\text{C}_{20}\text{H}_{24}\text{O}_2$) respectively.

Formula	Levonorgestrel	150 mg
	Ethinylestradiol	30 mg
	To make	1000 pills

Description Sugar coated dripping pills.

Identification (1) Remove the sugar coating of 1 pill, allow to disintegrate by warming with about 2 ml of ethanol in water bath and cool. Add 2 ml of alkaline trinitrophenol solution (mix equal amounts of ethanolic solution of 0.6% trinitrophenol, 7% sodium hydroxide solution and dilute ethanol TS before use), allow to stand for 30 minutes, a brownish-yellow colour is produced.

(2) Remove the sugar coating of 100 pills, allow to disintegrate by warming with 20 ml of water in a conical flask. Cool and transfer to a separator and wash the flask twice with water, 5 ml each. Combine the washings to the separator, extract with 3×40 ml of ether. Discard the aqueous layer. Wash the combined ether extract with 2×25 ml of water. Filter the ether extract through anhydrous sodium sulfate on cotton wool pad, vaporize the solvent, dissolve the residue in chloroform. Transfer it to a 2 ml volumetric flask, dilute to volume with chloroform, shake well, filter, if necessary. Determine the optical rotation with 1 dm micropolarimeter (Appendix VI E). It should be levorotatory, not lower than 0.18° .

(3) Remove the sugar coating of 10 pills, allow to disintegrate by warming with about 4 ml of water in a small beaker. Cool and transfer to a separator, extract with 20 ml of ether, discard the aqueous layer, wash the ethereal layer with water and filter through a layer of anhydrous sodium sulfate on a pad of cotton wool. Vaporize ether on an evaporating dish, dissolve the residue in 0.3 ml of chloroform, used as the test solution. Use the chloroform solutions of 1 mg of ethinylestradiol CRS per ml and 0.5 mg of levonorgestrel per ml, respectively, as the reference solutions. Carry out the test for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and chloroform-methanol (9 : 1) as the mobile phase. Apply 30 μ l each of the above three solutions to the same plate, after developing and removal of the plate, dry in air, spray with sulfuric acid-dehydrated ethanol (1 : 1), heat at

105°C until the colour of spots develop. The positions and colours of the two principal spots of the test solution are identical with that of the reference solutions accordingly.

Other requirements Comply with the general requirements for the pills (Appendix I H).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (60 : 40) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of levonorgestrel. The resolution factor between the peaks of levonorgestrel and internal standard complies with the related requirements.

Internal Standard Solution Dissolve a quantity of megestrol acetate with acetonitrile to produce a solution of about 1 mg per ml.

Procedure Weigh accurately and powder finely 20 pills. Weigh accurately a quantity equivalent to about 0.75 mg of levonorgestrel to a 10 ml volumetric flask, adding 1 ml of internal standard solution, measured accurately, and a quantity of the mobile phase and dissolve by ultrasonic generator, cool, dilute to volume with the mobile phase, mix well, filter. Inject 20 µl of the successive filtrate into the column. And then dissolve a quantity of levonorgestrel CRS and ethinylestradiol CRS with acetonitrile to produce a solution of 0.75 mg of levonorgestrel and 0.15 mg of ethinylestradiol per ml. Measure accurately 1 ml each of the solution and the internal standard solution to a 10 ml volumetric flask, dilute with the mobile phase, mix well. Inject 20 µl of the resulting solution into the column, calculate the content of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Compound Levonorgestrel Tablets

Compound Levonorgestrel Tablets contain 0.135-0.1725 mg of levonorgestrel ($C_{21}H_{28}O_2$) and 27.0-34.5 µg of ethinylestradiol ($C_{20}H_{24}O_2$) in each tablet.

Formula	Levonorgestrel	150 mg
	Ethinylestradiol	30 mg

To make	1000 tablets
---------	--------------

Description Sugar coated or film coated tablets with white or almost white core.

Identification (1) Powder 5 tablets, add 10 ml of chloroform, stir thoroughly and filter. To 2 ml of successive filtrate add 2 ml of alkaline trinitrophenol solution (mix equal amounts of ethanolic solution of 0.6% trinitrophenol, 7% sodium hydroxide solution and dilute ethanol TS before use), allow to stand for 30 minutes, a brownish-yellow colour is produced.

(2) To the powder equivalent to 15 mg of levonorgestrel add 200 ml of chloroform in portions, stir thoroughly, filter with a sintered glass filter (G_4), wash the residue and the filter with chloroform, combine the filtrates, evaporate the filtrate on a water bath to dryness and allow to cool. Dissolve the residue in 2 ml of chloroform and determine the optical rotation (Appendix VI E). It should be levo-rotatory, not lower than 0.18°.

(3) Powder 5 tablets, add 10 ml of chloroform, stir thoroughly and filter. Evaporate the filtrates on a water bath to dryness. Dissolve the residue in 1 ml of chloroform as test solution. Evaporate 1 ml of the reference solution obtained in Assay on a water bath to dryness and cool. Dissolve the residue in 1 ml of chloroform as reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (9 : 1) as the mobile phase. Apply separately to the plate 30 µl each of above two solutions, after developing and removal of the plate, dry it in air, spray with sulfuric acid-ethanol (1 : 1), heat at 105°C. The colour and position of the two principal spots in the chromatogram obtained with the test solution correspond to that obtained with reference solutions.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Reference preparation Weigh accurately about 15 mg of levonorgestrel CRS to a 50 ml volumetric flask, add ethanol to volume and shake thoroughly as solution (1). Weigh accurately about 15 mg of ethinylestradiol CRS to a 100 ml volumetric flask, add ethanol to volume and shake thoroughly as solution (2). Measure accurately 25 ml of solution (1) and 10 ml of solution (2) to a 100 ml volumetric flask. Dilute with ethanol to volume and shake well.

Test preparation Transfer 5 tablets into a separator, add 6 ml of water, shake to disintegrate, extract with six 7-8 ml portions of chloroform, filter the extracts into the 50 ml volumetric flask using a wad of absorbent cotton, dilute with chloroform to volume and shake well.

Procedure Levonorgestrel: Measured accurately 10 ml of the test solution in a 50 ml conical flask with stopper, evaporate on a water bath to dryness and dissolve the residue in 5 ml of ethanol. Measured accurately 2 ml of the reference solution in a conical flask with stopper, add 3 ml of ethanol. To above two solution add 4 ml of alkaline trinitrophenol solution separately, allow to stand in dark place for 40 minutes and measure the absorbance at 490 nm (Appendix IV A). Calculate the content of $C_{21}H_{28}O_2$.

Ethinylestradiol: Measured accurately 10 ml of the test solution in a 50 ml conical flask with stopper, evaporate on a water bath to dryness and dissolve the residue in 5 ml of ethanol. Measured accurately 2 ml of the reference solution in a conical flask with stopper, add 3 ml of ethanol. Cool above two solution on ice bath for 30 seconds, add 6 ml of sulfuric acid when shaking, cool on ice bath for 30 seconds, allow to stand in room temperature for 20 minutes and measure the absorbance at 530 nm (Appendix IV A). Calculate the content of $C_{20}H_{24}O_2$.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Lidocaine Carbonate Injection

Lidocaine Carbonate Injection is a sterile solution made by lidocaine hydrochloride and sodium bicarbonate under saturated of CO_2 in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of lidocaine carbonate, calculated on the lidocaine ($C_{14}H_{22}N_2O$).

Description A clear, colourless liquid.

Identification (1) To 10 ml of the injection, add 10 ml of

trinitrophenol TS, a precipitate is produced, filter, wash with water and dry, it melts at 228-232°C with decomposition (Appendix VI C).

(2) To 2 ml of the injection add 0.2 ml of cupric sulfate TS and 1 ml of sodium carbonate TS; a bluish-violet colour is produced. Shake the solution with 2 ml of chloroform, the chloroform layer exhibits a yellow colour on standing.

(3) Yields the reactions characteristic of carbonates and bicarbonates (Appendix III).

pH value 6.0-7.5 (Appendix VI H).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Measure accurately a quantity equivalent to about 0.172 g of lidocaine in a separator, make alkaline with ammonia TS and extract with four 20 ml portions of chloroform. Combine the chloroform layers, evaporate to almost dryness on a water bath. To the residue add accurately 30 ml of sulfuric acid (0.05 mol/L) VS, heat to evaporate the chloroform. Cool, add a few drops of methyl red-bromocresol green IS and titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 23.43 mg of $C_{14}H_{22}N_2O$.

Category Local anesthetic.

Strength (1) 5 ml : 86.5 mg
(2) 10 ml : 0.173 g (calculated on the lidocaine)

Storage Preserve in well closed containers.

Lidocaine Hydrochloride

$C_{14}H_{22}N_2O \cdot HCl \cdot H_2O$ 288.82 [6108-05-0]

Lidocaine Hydrochloride is *N*-(2,6-dimethylphenyl)-2-(diethylamino)-acetamide hydrochloride monohydrate. It contains not less than 99.0% of $C_{14}H_{22}N_2O \cdot HCl$, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; taste, bitter with numbing.

Freely soluble in water or ethanol; soluble in chloroform; insoluble in ether.

Melting range 75-79°C (Appendix VI C).

Identification Dissolve 0.2 g in 20 ml of water and carry out the following tests: (1) To 10 ml of the solution, add 10 ml of trinitrophenol TS, a precipitate is produced, filter, wash with water and dry, it melts at 228-232°C with decomposition (Appendix VI C).

(2) To 2 ml of the solution add 0.2 ml of cupric sulfate TS and 1 ml of sodium carbonate TS; a bluish-violet colour is produced. Shake the solution with 2 ml of chloroform, the chloroform layer exhibits a yellow colour on standing.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of lidocaine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 40 ml of water, pH 4.0-5.5 (Appendix VI H).

Clarity of solution A solution of 1.0 g in 10 ml of water is clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Water 5.0%-7.5% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 2.0 g in 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 27.08 mg of $C_{14}H_{22}N_2O \cdot HCl$.

Category Local anesthetic and antiarrhythmic agent.

Storage Preserve in tightly closed containers.

Preparation (1) Lidocaine Hydrochloride Injection
(2) Lidocaine Hydrochloride Mucilage (I)

Lidocaine Hydrochloride Injection

Lidocaine Hydrochloride Injection is a sterile solution of lidocaine hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$).

Description A clear, colourless liquid.

Identification Complies with the tests (1), (2) and (4) for Identification described under Lidocaine Hydrochloride.

pH value 3.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (measure 1.3 ml of 1 mol/L sodium dihydrogen phosphate solution and 32.5 ml of 0.5 mol/L disodium hydrogen phosphate solution into 1000 ml volumetric flask, dilute with water to the volume and mix well)-acetonitrile (50 : 50) (adjust with phosphoric acid to pH 8.0) as the mobile phase. Detection wavelength is 254 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of lidocaine.

Procedure Dilute an accurately measured volume of the injection equivalent to about 100 mg of lidocaine hydrochloride in a 50 ml volumetric flask with the mobile phase to volume and mix well. Inject 20 μ l of the resulting solution into the column, record the peak area correspondingly obtained in the chromatogram. Dissolve about 85 mg of lidocaine CRS, accurately weighed, in 0.5 ml of 1 mol/L hydrochloric acid in a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well, use the resulting solution as reference solution. Repeat the operation, using the reference solution instead of test solution. Calculate the content of $C_{14}H_{22}N_2O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method and by multiplying by 1.156.

Category As described under Lidocaine Hydrochloride.

Strength (1) 5 ml : 50 mg (2) 5 ml : 0.1 g

(3) 10 ml : 0.2 g (4) 20 ml : 0.4 g

Storage Preserve in well closed containers.

Lidocaine Hydrochloride Mucilage (I)

Lidocaine Hydrochloride Mucilage is a sterile mucilage of lidocaine hydrochloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$).

Description A colourless to slightly yellow, viscous liquid.

Identification (1) Dilute about 20 g with 20 ml of water in a separator, make alkaline with ammonia TS and extract with 20 ml of chloroform. To the chloroform layers add 20 ml of water, make acidic with dilute hydrochloric acid, shake and filter the acid layers. To the filtrate add 10 ml of trinitrophenol TS, a yellow precipitate is produced.

(2) Dilute about 10 g with 20 ml of water, to 2 ml of the solution add 0.2 ml of cupric sulfate TS and 1 ml of sodium carbonate TS, a bluish-purple colour is produced. Mix the solution with 2 ml of chloroform, the chloroform layer exhibits a yellow colour on standing.

(3) The aqueous solution obtained in (2) yields the reactions characteristic of chlorides (Appendix III).

pH value 6.0-7.0 (Appendix VI H).

Fill Complies with the test for minimum fill (Appendix X F).

Sterility Complies with the test for sterility (Appendix XI H).

Assay Weigh accurately a quantity equivalent to about 20 mg of lidocaine hydrochloride to a separator containing 10 ml of water, make alkaline with ammonia TS and extract with four 20 ml portions of chloroform. Combine the chloroform layers, evaporate on a water bath to almost dry, add accurately 20 ml of sulfuric acid (0.005 mol/L) VS, evaporate again on a water bath to remove chloroform, cool. Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium hydroxide (0.01 mol/L) VS, perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.005 mol/L) VS is equivalent to 2.708 mg of $C_{14}H_{22}N_2O \cdot HCl$.

Category As described under Lidocaine Hydrochloride.

Strength (1) 10 g : 0.2 g (2) 20 g : 0.4 g

Storage Preserve in tightly closed containers.

Ligustrazine Phosphate

$C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$ 252.20

Ligustrazine Phosphate is 2,3,5,6-tetramethyl pyrazine phosphate, monohydrate. It contains not less than 98.0% and not more than 102.0% of $C_8H_{12}N_2 \cdot H_3PO_4$, calculated on anhydrous basis.

Description A white or almost white crystalline powder; stinking slightly; taste bitter.

Soluble in water or ethanol, insoluble in chloroform.

Identification (1) To about 10 mg, add 5 ml of water to dissolve ligustrazine phosphate, add 2 drops of dilute nitric acid, shake well, add 2 drops of potassium iodobismuthate TS; an orange red precipitate is produced.

(2) The light absorption of a solution of 15 μ g per ml in water exhibits a maximum at 295 nm (Appendix IV A).

(3) Yield the reactions characteristic of phosphate (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 2.4-3.2 (Appendix VI H).

Related substance Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (3 : 2) as the mobile phase. Detection wavelength is 295 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of ligustrazine phosphate. Prepare a solution of 0.5 mg per ml of the substance being examined in water as test solution; and measure accurately 1 ml of the test solution into a 100 volumetric flask and add water to volume as reference solution. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale. Inject separately 20 μ l each of the resulting solutions into the column, and record the chromatogram for triple the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained from the reference solution.

Residual solvent Carry out the method for residual solvent (Appendix VIII P, method 2), using a quartz capillary column packed with bonded polyethyleneglycol as the stationary phase; a flame ionization detector is used. The temperature of vaporizer is 200°C, the temperature of detector is 250°C; maintain the column temperature at 50°C for 5 minutes, then raise the temperature to 190°C by 50°C per minute, maintain for 5 minutes. The resolution factor between the peaks of ethanol, acetone and solvent complies with the related requirements, the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of acetone. To a quantity of the substance being examined, weigh accurately, add dimethyl sulfoxide to produce a solution of 0.1 g per ml as test solution; measure accurately 2 ml of the test solution into a headspace vial, and maintain the temperature at 75°C for 20 minutes. Withdraw accurately 1 ml of the gas from headspace vial and inject into the column, record the chromatogram. Weigh accurately each quantity of ethanol and acetone, add dimethyl sulfoxide to produce a solution of 0.5 mg each ethanol and acetone per ml as reference solution. Measure accurately 2 ml into the headspace vial, and repeat the operation as described above. Calculate the content of ethanol and acetone, complies with the requirements.

Water 6.0%-8.0% (Appendix VIII M, method 1).

Heavy metals To 0.5 g add 23 ml of water, heat to dissolve ligustrazine phosphate, add 2 ml dilute acetic acid. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric (0.1 mol/L) VS is equivalent to 23.42 mg of $C_8H_{12}N_2 \cdot H_3PO_4$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ligustrazine Phosphate Tablets
(2) Ligustrazine Phosphate Injection
(3) Ligustrazine Phosphate Capsules

Ligustrazine Phosphate Capsules

Ligustrazine Phosphate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ligustrazine phosphate ($C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$).

Description Capsules containing white or almost white powder.

Identification To a quantity of the contents, equivalent to about 0.2 g of ligustrazine phosphate, add 20 ml of water, shake and filter. The filtrate complies with the tests for Identification described under Ligustrazine Phosphate.

Dissolution Carry out the method for dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium and adjust the rotation speed of the basket to 100 rpm. Withdraw 10 ml of the solution at exact 20 minutes and filter. Transfer 3 ml of the successive filtrate, accurately measured, to a 10 ml volumetric flask and dilute with water to volume. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the dissolution of $C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$ from each capsule, taking 326 as the value of A (1%, 1 cm); not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 50 mg of ligustrazine phosphate, to a 100 ml volumetric flask, add 60 ml of water, shake thoroughly to dissolve ligustrazine phosphate, dilute with water to volume and mix well, filter. Transfer 3 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the content of $C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$, taking 326 as the value of A (1%, 1 cm).

Category As described under Ligustrazine Phosphate.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Ligustrazine Phosphate Injection

Ligustrazine Phosphate Injection is a sterile solution of Ligustrazine Phosphate in Water for injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ligustrazine phosphate ($C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$).

Description A clear, colourless liquid.

Identification Dilute about 0.4 ml with 5 ml of water. The resulting solution complies with the tests for Identification described under ligustrazine phosphate.

pH value 2.0-3.0 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 5 ml of a solution of 2 mg of ligustrazine phosphate per ml in Sodium chloride injection per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Measure accurately 2 ml to a 100 ml volumetric flask, dilute with water to volume and mix well, then measure accurately 3 ml of the diluted solution to another 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A), calculate the content of $C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$, taking 326 as the value of A (1%, 1 cm).

Category As described under Ligustrazine Phosphate.

Strength 2 ml : 50 mg

Storage Preserve in well closed containers, protected from light.

Ligustrazine Phosphate Tablets

Ligustrazine Phosphate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ligustrazine phosphate ($C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$).

Description Sugar coated tablets with white or almost white core.

Identification To a quantity of powdered tablets, equivalent to about 0.2 g of ligustrazine phosphate, add 20 ml of water, shake to dissolve ligustrazine phosphate, filter. The filtrate complies with the tests for Identification described under Ligustrazine Phosphate.

Dissolution Carry out the method for dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium and adjust the rotation speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exact 45 minutes and filter. Transfer 3 ml of the successive filtrate, accurately measured, to a 10 ml volumetric flask and dilute with water to volume. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the dissolution of $C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$ from each tablet, taking 326 as the value of A (1%, 1 cm); not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of ligustrazine phosphate, in a 100 ml volumetric flask, add 60 ml of water, shake thoroughly to dissolve ligustrazine phosphate, dilute with water to volume and mix well, filter. Transfer 3 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the content of $C_8H_{12}N_2 \cdot H_3PO_4 \cdot H_2O$, taking 326 as the value of A (1%, 1 cm).

Category As described under Ligustrazine Phosphate.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Lincomycin Hydrochloride

$C_{18}H_{34}N_2O_6S \cdot HCl \cdot H_2O$ 461.02 [7179-49-9]

Lincomycin Hydrochloride is (2*S*-trans) methyl 6,8-dideoxy-6-[[[1-methyl-4-propyl-2-pyrrolidinyl] carbonyl] amino]-1-thio-*D*-erythro- α -*D*-galacto-octopyranoside monohydrochloride monohydrate. It contains not less than 82.5% of $C_{18}H_{34}N_2O_6S$, calculated on the anhydrous basis.

Description A white crystalline powder; odour, slight or characteristic; taste, bitter. Freely soluble in water or methanol; sparingly soluble in ethanol.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of lincomycin hydrochloride CRS.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of lincomycin CRS.

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Crystallinity Complies with the test for Crystallinity (Appendix IX D).

Acidity To a quantity add water to produce a solution of 0.1 g per ml, pH 3.0-5.5 (Appendix VI H).

Clarity and colour of solution To each of 5 portions add water to produce a solution of 0.4 g of $C_{18}H_{34}N_2O_6S$ per ml, the solutions are clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B). Any colour produced is not more intense than that of reference solution Y₁ or YG₁ (Appendix IX A, method 1).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.5 EU per mg (for parenteral administration).

Lincomycin B Carry out the method described under Assay. The peak area of lincomycin B is not greater than 5.0% of the sum of the peak areas of lincomycin and lincomycin B.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L borax solution (adjust to pH 6.0 with 85% phosphoric acid)-methanol (4 : 6) as the mobile phase. Detection wavelength is 214 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of lincomycin. The resolution factor between peaks of lincomycin and lincomycin B is not less than 2.6. The relative retention times for lincomycin B and

lincomycin are 0.5-0.7 and 1.0, respectively.

Procedure Dissolve about 50 mg, accurately weighed, with a quantity of the mobile phase in a 25 ml volumetric flask, add the mobile phase to volume, mix well. Inject 10 μ l of the resulting solution into the column. Repeat the operation, using lincomycin CRS instead of the substance being examined, calculate the content of $C_{18}H_{34}N_2O_6S$.

Category Antibiotic.

Storage Preserve in tightly closed containers.

Preparation (1) Lincomycin Hydrochloride Capsules
(2) Lincomycin Hydrochloride Injections
(3) Lincomycin Hydrochloride Tablets

Lincomycin Hydrochloride Capsules

Lincomycin Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of labelled amount of lincomycin hydrochloride, calculated with reference to lincomycin ($C_{18}H_{34}N_2O_6S$).

Description Capsules containing white crystalline powder.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of lincomycin hydrochloride CRS.

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Water Not more than 7.0% (Appendix VIII M, method 1 A), using the mixed contents.

Lincomycin B Carry out the method described under Assay, using 2 mg per ml of the solution containing the substance being examined. The peak area of lincomycin B is not greater than 5.0% of the sum of the peak areas of lincomycin and lincomycin B.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity (equivalent to about 0.25 g of lincomycin) of the mixed contents obtained from the test for weight variation of contents with the mobile phase to produce a solution of 2 mg per ml and filter. Carry out the Assay described under Lincomycin Hydrochloride, using the successive filtrate as the test solution.

Category As described under Lincomycin Hydrochloride.

Strength (1) 0.25 g (calculated as $C_{18}H_{34}N_2O_6S$)
(2) 0.5 g (calculated as $C_{18}H_{34}N_2O_6S$)

Storage Preserve in tightly closed containers.

Lincomycin Hydrochloride Injection

Lincomycin Hydrochloride Injection is a sterile solution of lincomycin hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of labelled amount of lincomycin ($C_{18}H_{34}N_2O_6S$).

Description A clear, colourless solution.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in

the chromatogram of lincomycin hydrochloride CRS.

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

pH pH 3.0-5.5 (Appendix VI H), using a solution of 0.1 g per ml in water.

Colour The solution is colourless; any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Sterility Carry out the test for sterility (Appendix XII H, membrane filtration method), dissolving each content in not less than 500 ml of 0.9% sterile sodium chloride solution respectively.

Bacterial endotoxin Complies with the corresponding requirements described under Lincomycin Hydrochloride.

Lincomycin B Carry out the method described under Assay. The peak area of lincomycin B is not greater than 5.0% of the sum of the peak areas of lincomycin and lincomycin B.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L borax solution (adjust to pH 5.0 with 85% phosphoric acid)-methanol-acetonitrile (60 : 36 : 4) as the mobile phase. Detection wavelength is 214 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of lincomycin.

Procedure Measure a quantity of the substance being examined accurately and dilute with the mobile phase to produce a solution of 2 mg per ml. Inject 10 µl of the resulting solution into the column. Repeat the operation, using lincomycin CRS instead of the substance being examined, calculate the content of C₁₈H₃₄N₂O₆S.

Category As described under Lincomycin Hydrochloride.

Strength (1) 1 ml : 0.2 g (calculated as C₁₈H₃₄N₂O₆S)
(2) 2 ml : 0.6 g (calculated as C₁₈H₃₄N₂O₆S)

Storage Preserve in well closed containers.

Lincomycin Hydrochloride Tablets

Lincomycin Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of labelled amount of lincomycin hydrochloride, calculated with reference to lincomycin (C₁₈H₃₄N₂O₆S).

Description White tablets or sugar coated tablets with white core.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of lincomycin hydrochloride CRS.

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Lincomycin B Carry out the method described under Assay. The peak area of lincomycin B is not greater than 5.0% of the sum of the peak areas of lincomycin and lincomycin B.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets or 4 sugar coated tablets. To an accurately weighed quantity of powder equivalent to about 0.25 g of lincomycin add sufficient 80%

ethanol to produce a suspension containing about 10 mg per ml, shake thoroughly, allow it to stand. Measure accurately 5 ml of the supernatant liquid to a 25 ml volumetric flask, dilute with the mobile phase to volume and mix thoroughly. Filter through a 0.45 µm membrane, use the successive filtrate as test solution. Inject 10 µl to the column and proceed as described under Lincomycin Hydrochloride.

Category As described under Lincomycin Hydrochloride.

Strength (1) 0.25 g (calculated as C₁₈H₃₄N₂O₆S)
(2) 0.5 g (calculated as C₁₈H₃₄N₂O₆S)

Storage Preserve in tightly closed containers.

Lindane

C₆H₆Cl₆ 290.83

[58-89-9]

Lindane is γ-1,2,3,4,5,6-hexachlorocyclohexane. It contains not less than 99.0% of C₆H₆Cl₆.

Description A white crystalline powder; odour, slightly characteristic. Freely soluble in acetone or ether; soluble in dehydrated ethanol; insoluble in water.

Congealing point Not less than 112 °C (Appendix VI D).

Identification Transfer 1 ml of 0.5% lindane solution in ethanol to a test tube with stopper, add 3 ml of ethanol and 1 ml of ethanolic potassium hydroxide TS, allow to stand for 10 minutes. The solution yields the reactions characteristic of chlorides (Appendix III).

α-isomer Weigh accurately about 10 mg into a 100 ml volumetric flask. Add acetone to dissolve the substance being examined and dilute to volume. Use this solution as the test solution. Dissolve a quantity of lindane CRS, accurately weighed, in acetone to produce a solution of 1 µg per ml. Use this solution as the reference solution. Transfer respectively 1 ml each of the above two solutions, accurately measured, to two 50 ml volumetric flasks, dilute with cyclohexane to volume. Transfer respectively 1 ml of each solution, accurately measured, to two 10 ml volumetric flasks, dilute with cyclohexane to volume, and mix well. Carry out the method for gas chromatography (Appendix V E), using a glass column 2 m long coated with 2% of silicone (OV-17), maintain the column temperature at 190°C, and detect with an electron capture detector. Any peak area corresponding to α-isomer in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram obtained with the reference solution.

Acidity Dissolve 10.0 g in 25 ml of acetone, add 75 ml of water and 1 drop of methyl red IS, and mix well. Titrate with sodium hydroxide (0.02 mol/L) VS until the colour changes to yellow. Perform a blank determination and make any necessary correction. Not more than 5.0 ml of sodium hydroxide (0.02 mol/L) VS is required.

Chloride Boil 0.75 g with 15 ml of water for 1 minute, cool, shake and filter. Add 3 ml of water and 2 ml of ethanol to 10 ml of the filtrate. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Weigh accurately about 0.4 g, add 25 ml of ethanol, heat in a water bath to dissolve the substance being examined, cool. Add 10 ml of 1 mol/L ethanolic potassium hydroxide solution, shake, and allow to stand for 10 minutes. Add 100 ml of water, neutralise with 2 mol/L nitric acid solution, and add 10 ml in excess. Add 50 ml of silver nitrate (0.1 mol/L) VS, accurately measured, mix well. Add 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS until the colour changes to pale brownish-red. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 9.694 mg of $C_6H_6Cl_6$.

Category Parasiticide.

Storage Preserve in tightly closed containers, protected from light. Avoid connecting with ironware.

Preparation Lindane Cream

Lindane Cream

Lindane Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of lindane ($C_6H_6Cl_6$).

Description A white cream.

Identification To about 1 g of the cream equivalent to 10 mg of lindane add 20 ml of chloroform, shake to dissolve the substance being examined, filter. Evaporate the filtrate to dryness. Dissolve the residue in 1 ml of acetone, and use the clear liquid as the test solution. Dissolve lindane CRS in acetone to produce a solution of about 10 mg per ml, and use this solution as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of butanone-*n*-hexane (7 : 93) as the mobile phase. Apply separately to the plate 5 μ l each of above two solutions. After developing and removal of the plate, dry it in air and spray the plate with a 0.5% solution of *o*-dianisidine in acetone. Place the plate under ultraviolet light for 10 minutes and examine in visible light. The colour and position of the principal spot in the chromatogram obtained with test solution correspond to those of the principal spot obtained with reference solution.

α -isomer Transfer a quantity of the cream equivalent to about 10 mg of Lindane, accurately weighed, to a 100 ml volumetric flask. Add acetone to dissolve the substance being examined and dilute to volume as the test solution. Carry out the test of α -isomer described under Lindane, beginning at the words "dissolve a quantity of lindane CRS...". It complies with the requirements.

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Carry out the method for gas chromatography (Appendix V E), using a glass column 2 m long coated with 2% of silicone (OV-17), maintain the column temperature at 190°C, and detect with an electron capture detector.

Procedure Transfer a quantity of the cream equivalent to about 10 mg of lindane, accurately weighed, to a 100 ml volumetric flask. Add acetone to dissolve the substance being examined and dilute to volume. Transfer 2 ml, accurately measured, to a 100 ml volumetric flask, dilute to volume with cyclohexane. Transfer 2 ml, accurately measured, to a 20 ml volumetric flask, dilute to volume with cyclohexane, mix well. Inject a quantity of the resulting solution, accurately

measured, into the column. Dissolve a quantity of Lindane CRS, accurately weighed, in acetone to produce a solution of about 0.2 μ g per ml, repeat the operation. Calculate the content of $C_6H_6Cl_6$ by the external standard method.

Category As described under Lindane.

Strength 1%

Storage Preserve in tightly closed containers, stored in a cool place.

Liquid Paraffin

Liquid Paraffin is a mixture of liquid hydrocarbons obtained from petroleum.

Description Colourless transparent oily liquid; odourless; tasteless; free from fluorescence in daylight. Soluble in chloroform, ether or volatile oils; insoluble in ethanol or water.

Relative density 0.845-0.890 (Appendix VI A).

Viscosity The kinematic viscosity (Appendix VI G, method 1) at 40°C (inner diameter of capillary tube is 1 mm) is not less than 36 mm²/s.

Acidity To 5.0 ml add 5 ml of neutralized ethanol (neutral to phenolphthalein I S) and boil. The solution yields a neutral reaction to moistened litmus paper.

Polycyclic aromatic compounds Measure 25 ml to a separator, add 25 ml of *n*-hexane, mix, add accurately 5 ml of dimethylsulfoxide, shake vigorously for 2 minutes and allow to separate. Transfer dimethylsulfoxide layer into another separator, wash with 2 ml of *n*-hexane, allow to centrifuge, if necessary. Measure the absorbances of dimethylsulfoxide layer in the range of 260-350 nm (Appendix IV A). The maximum absorbance is not greater than 0.10.

Solid paraffins Fill a stoppered test tube internal diameter about 25 mm with the substance being examined, previously dried at 105°C for 2 hours and cooled in a desiccator over sulfuric acid. Stopper the tube and cool at 0°C for 4 hours. Any opalescence produced is not more intense than that of an equal volume of reference solution [add 6 ml of dilute nitric acid and 1.0 ml of silver nitrate TS to 0.15 ml of 0.01 mol/L hydrochloric acid solution and dilute with water to 50 ml].

Readily carbonizable substances Add 5 ml of sulfuric acid (94.5%-95.5%) to 5 ml of the substance being examined in a stoppered test tube (about 160 mm \times 25 mm). Place the tube in a water bath for 30 seconds and draw out of the bath quickly. Stopper the test tube and shake vigorously in longitudinal direction 3 times with a finger tightly pressed on the stopper. The shaking amplitude is not less than 12 cm but the time is not exceeding 3 seconds. Place the tube again into the water bath and shake as above at intervals of 30 seconds. After a total of 10 minutes counted from the initial immersion of the test tube in the water bath, take it out from the bath and allow to stand. The paraffin layer is colourless. Any colour developed in the acid layer is not more intense than that of a reference solution prepared by mixing 1.5 ml of standard potassium dichromate CS, 1.3 ml of standard cobaltous chloride CS, 0.5 ml of standard copper sulfate CS and 1.7 ml of water with 5 ml of the substance being examined.

Category Cathartic.

Storage Preserve in tightly closed containers.

Lithium Carbonate

Li_2CO_3 73.89

[554-13-2]

Lithium Carbonate contains not less than 98.5% of Li_2CO_3 .

Description A white, crystalline powder; odourless; tasteless. The aqueous solution exhibits alkaline reaction. Slightly soluble in water; practically insoluble in ethanol.

Identification (1) Moisten a quantity on a platinum wire with hydrochloric acid. It imparts an intense crimson colour to a nonluminous flame.

(2) The aqueous solution yields the reactions characteristic of carbonates (Appendix III).

Chloride Carry out the limit test for chlorides (Appendix VII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.07%).

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 0.20 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.1%).

Aluminum and Iron To 0.5 g add 10 ml of water and a few drops of hydrochloric acid with stirring to dissolve. Heat to boiling and allow to cool. Make alkaline 5 ml of the solution with ammonia TS; no turbidity is produced.

Acid-insoluble substance To 10 g in a beaker add 50 ml of water, then add slowly 70 ml of hydrochloric acid solution (1→2). Cover the beaker with a watch glass and boil for 1 hour. Filter through a sintered glass filter previously dried to constant weight at 110°C. Wash the filtrate with hot water until the washing is free from chloride. Dry at 110°C for 1 hour; the residue is not more than 2 mg.

Calcium Mix 5.0 g with 50 ml of water and add an excess of dilute hydrochloric acid. Boil to expel carbon dioxide, cool, add 5 ml of ammonium oxalate TS, then neutralize with ammonia TS and allow to stand for 4 hours. Filter through a sintered glass filter and wash with water until the washing yields no turbidity with calcium chloride TS. Place the sintered glass filter in a beaker and cover with water, add 3 ml of sulfuric acid, heat to 70°C and titrate with potassium permanganate (0.02 mol/L) VS until a faint pink colour persists for 30 seconds. Not more than 3.8 ml of potassium permanganate (0.02 mol/L) VS is consumed (0.15%).

Magnesium Dissolve 1.0 g in 3 ml of water and about 2 ml of nitric acid. Neutralize with sodium hydroxide TS, dilute with water to produce 10 ml and mix well. To 0.70 ml of the solution add water to produce 9 ml, then add 1 ml of glycerin, 0.15 ml of 0.01% titan yellow solution, 0.25 ml of ammonium oxalate TS, 5 ml of sodium hydroxide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared similarly using 1.0 ml of magnesium sulfate standard solution, measure accurately 1 ml of 1.01% magnesium sulfate solution, dilute with water to produce 100 ml and mix well (0.015%).

Potassium Dissolve 0.10 g in a 50 ml volumetric flask using 10 ml of hydrochloric acid solution (1→2) and dilute to volume with water (test preparation). Dissolve 0.10 g in another 50 ml volumetric flask using 10 ml of hydrochloric acid solution (1→2), add 3.0 ml of potassium chloride standard solution (transfer 191 mg of potassium chloride CRS previously dried at 105°C for 1 hour and accurately weighed, to a 1000 ml volumetric flask, add water to

volume and mix well. Measure accurately 10 ml of the solution into a 100 ml volumetric flask, dilute with water to volume and mix well), dilute with water to volume and mix well (reference preparation). Carry out the method for atomic absorption spectrophotometry (Appendix IV D) and measure the absorbances of the two solutions at 766.5 nm; not more than 0.030%.

Sodium Dissolve 0.50 g in a 50 ml volumetric flask using 10 ml of hydrochloric acid solution (1→2) and dilute with water to volume (test preparation), dissolve 0.50 g in another 50 ml volumetric flask in 10 ml of hydrochloric acid solution (1→2), add 23 ml of sodium chloride standard solution and dilute with water to volume (reference preparation). Carry out the method for atomic absorption spectrophotometry (Appendix IV D) and measure the absorbances of the two solutions at 589 nm; not more than 0.030%.

Heavy metals Dissolve 1.0 g in a quantity of hydrochloric acid, add a quantity of water, adjust pH to 3-4 with dilute acetic acid or ammonia TS and dilute with water to 25 ml. Carry out the limit test for heavy metals (Appendix VII H, method 1); not more than 0.002%.

Arsenic To 1.0 g add 22 ml of water and 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VII J); not more than 0.0002%.

Assay Weigh accurately about 1 g, add 50 ml of water, and 50 ml of sulfuric acid (0.5 mol/L) VS, accurately measured. Boil gently to expel carbon dioxide, cool, add phenolphthalein IS, and titrate with sodium hydroxide (1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 36.95 mg of Li_2CO_3 .

Category Antimanic agent.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Lithium Carbonate Sustained-release Tablets
(2) Lithium Carbonate Tablets

Lithium Carbonate Sustained-release Tablets

Lithium Carbonate Sustained-release Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of lithium carbonate (Li_2CO_3).

Description White or almost white tablets.

Identification Comply with the tests for Identification described under lithium carbonate, Using a quantity of the powdered tablets.

Drug release Carry out the drug release test [Appendix X D (1)], with the apparatus of the dissolution test method I using 1 tablet. Using 1000 ml of 0.1 mol/L hydrochloric acid solution as the release medium and adjust the rotational speed of the basket to 150 rpm. Withdraw a quantity of the solution after exactly 3 hours and filter, collect the successive filtrate as the test solution (1). Carry out the test as described above using the remaining table with 1000 ml of Phosphate BS (pH 6.0) [Dissolve 107 g of sodium dihydrogen phosphate ($\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$) and 46g of disodium hydrogen phosphate ($\text{NaH}_2\text{PO}_4 \cdot 12\text{H}_2\text{O}$) in water to make 5000 ml and mix well] as the release medium. Withdraw a quantity of the solution after exactly 3 hours and filter, use the successive filtrate as the test solution (2).

Carry out the method for atomic absorption spectrophotometry (Appendix IV D, method 1), measure the absorbances of the solutions at 670.7 nm respectively, calculate the amount of lithium carbonate dissolved in the acid solvent and the buffer solvent separately. The amount of lithium carbonate dissolved per tablet in 3 hours is 45%-65% of the labelled amount; that dissolved per tablet in 6 hours is 65%-85% of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Boil gently a quantity of the powder equivalent to about 1 g of lithium carbonate accurately weighed with 50 ml of water and 50 ml of sulfuric acid (0.5 mol/L) VS, to expel carbon dioxide. Allow to cool, add phenolphthalein IS, titrate with sodium hydroxide (1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 36.95 mg of Li_2CO_3 .

Category As described under lithium carbonate.

Strength 0.3 g

Storage Preserve in tightly closed containers.

Lithium Carbonate Tablets

Lithium Carbonate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of lithium carbonate (Li_2CO_3).

Description White tablets.

Identification Comply with the tests for Identification described under Lithium Carbonate, using a quantity of powdered tablets.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as dissolution medium and the rotational speed of the basket to 100 rpm. Withdraw 25 ml of the solution after exactly 30 minutes and filter. Measure accurately 20 ml of the successive filtrate, add 5 drops of the methyl red-bromocresol green IS, and titrate with hydrochloric acid (0.01 mol/L) VS until a dark purple colour produced. Each ml of hydrochloric acid (0.01 mol/L) VS equivalent to 0.3695 mg of Li_2CO_3 . Calculate the dissolution of Li_2CO_3 . Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 1 g of lithium carbonate. Proceed as described in the Assay described under Lithium Carbonate, beginning at the words "add 50 ml of water". Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 36.95 mg of Li_2CO_3 .

Category As described under Lithium Carbonate.

Strength 0.25 g

Storage Preserve in tightly closed containers.

Lobeline Hydrochloride

$\text{C}_{22}\text{H}_{27}\text{NO}_2 \cdot \text{HCl}$ 373.92

Lobeline Hydrochloride is 2- [1-methyl-6-(β -hydroxyphenethyl)-2-piperidyl] acetophenone hydrochloride. It contains not less than 99.0% of $\text{C}_{22}\text{H}_{27}\text{NO}_2 \cdot \text{HCl}$, calculated on the dried basis.

Description White crystals or a granular powder; odourless; taste, bitter. The aqueous solution exhibits weak acid reaction.

Freely soluble in ethanol or chloroform, soluble in water.

Specific optical rotation -56° to -58° , in a solution of 20 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μg per ml in water at 249 nm (Appendix IV A), the value of A (1%, 1 cm) is 360-390.

Identification (1) Dissolve 0.1 g in 10 ml of water and boil, the characteristic odour of acetophenone is perceptible and more intense on adding 1 drop of 20% sodium hydroxide solution.

(2) Dissolve 10 mg in 1 ml of sulfuric acid, add 1 drop of formaldehyde solution, a red colour is produced.

(3) Dissolve 0.1 g in 5 ml of water, add dropwise ammonia TS to make the solution alkaline. Allow to stand until precipitate is produced, filter, wash the precipitate with water and dry it over phosphorous pentoxide for 24 hours. It melts at about 120°C (Appendix VI C).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity of chloroform solution A solution of 0.5 g in 10 ml of chloroform is clear.

Loss on drying When dried over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 37.39 mg of $\text{C}_{22}\text{H}_{27}\text{NO}_2 \cdot \text{HCl}$.

Category Respiratory stimulant.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Lobeline Hydrochloride Injection

Lobeline Hydrochloride Injection

Lobeline hydrochloride Injection is a sterile solution of lobeline hydrochloride in Water for Injection.

tion. It contains not less than 90.0% and not more than 110.0% of the labelled amount of lobeline hydrochloride ($C_{22}H_{27}NO_2 \cdot HCl$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Complies with test (1) for Identification described under Lobeline Hydrochloride.

(2) The light absorption of a solution obtained in the Assay exhibits a maximum at 249 nm and a minimum at 222 nm (Appendix IV A).

pH value 2.7-4.5 (Appendix VI H).

Colour Carry out the method for colour of solution (Appendix IX A): any colour produced is not more intense than that of reference solution Y_2 .

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity with water to produce a solution of 10 μ g per ml, measure the absorbance of the solution at 249 nm (Appendix IV A). Calculate the content of $C_{22}H_{27}NO_2 \cdot HCl$, taking 375 as the value of A (1%, 1 cm).

Category As described under Lobeline Hydrochloride.

Strength (1) 1 ml : 3 mg (2) 1 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Lofexidine Hydrochloride

$C_{11}H_{12}Cl_2N_2O \cdot HCl$ 295.60 [21498-08-08]

Lofexidine Hydrochloride is 2-[1-(2,6-dichlorophenoxy)-ethyl]-2-imidazoline monohydrochloride. It contains not less than 99.0% of $C_{11}H_{12}Cl_2N_2O \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Freely soluble in water or ethanol; slightly soluble in chloroform; very slightly soluble in acetone; practically insoluble in ether.

Melting range 224-229°C (Appendix VI C).

Identification (1) Dissolve about 1 mg in 2 ml of water, add 1 ml of 5% sodium nitroprusside solution freshly prepared, 2 ml of sodium hydroxide TS and 1 g of sodium bicarbonate, shake, a purple colour is produced. The colour of solution turns to dark after standing.

(2) Dissolve separately the substance being examined and lofexidine hydrochloride CRS in methanol to produce two solutions of 2 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dehydrated ethanol-chloroform-ammonia concentrated TS (70 : 50 : 2) as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions. After developing and removal of the plate, dry it in air and expose the plate to iodine vapour. The colour and position of the principal spot in the chromatogram obtained with the substance being examined correspond to that of the principal spot obtained with lofexidine

hydrochloride CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of lofexidine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chloride (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 5.0-6.5 (Appendix VI H).

Clarity of solution Dissolve 0.10 g in 10 ml of water, the solution is clear.

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce a test solution of 0.5 mg per ml. Transfer 1 ml of the test solution, measured accurately, in a 100 ml volumetric flask, dilute with mobile phase to volume, mix well, to produce a reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.27% potassium dihydrogen phosphate solution (65 : 35) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 600, calculated with reference to the peak of lofexidine. Inject 10 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject separately 10 μ l each of the test solution and the reference solution into the column and record the chromatograms for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Weigh accurately 0.2 g, add 15 ml of glacial acetic acid and 3 ml of mercuric acetate TS, warm slightly to dissolve, cool, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.56 mg of $C_{11}H_{12}Cl_2N_2O \cdot HCl$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Lofexidine Hydrochloride Tablets

Lofexidine Hydrochloride Tablets

Lofexidine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of lofexidine hydrochloride ($C_{11}H_{12}Cl_2N_2O \cdot HCl$).

Description White tablets.

Identification (1) Triturate 10 tablets, add 10 ml of water, stir thoroughly and with the aid of an ultrasonic bath for 5 minutes to dissolve lofexidine hydrochloride. Filter, transfer the filtrate to a separator, adjust to alkaline with ammonia concentrated TS, add 20 ml of chloroform and shake to extract. Evaporate the chloroform extract to dryness and dissolve the residue in 1 ml of methanol. Use this solution as test solution. Dissolve a quantity of lofexidine hydrochloride CRS in methanol to produce a reference solution of 2 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica

gel GF₂₅₄ as the coating substance and a mixture of dehydrated ethanol-chloroform-ammonia concentrated TS (70 : 30 : 2) as the mobile phase. Apply separately on the plate 10 µl each of the above two solutions. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm) and spray with dilute potassium iodobismuthate TS. The colour and position of the principal spot in the chromatogram obtained with test solution corresponds to that of the principal spot obtained with reference solution.

(2) To the above test solution, add 1 ml of water, mix well, add 1 ml of freshly prepared 5% sodium nitroprusside solution, 2 ml of sodium hydroxide TS and 1 g of sodium bicarbonate, shake, a purple colour is produced. The colour of solution turns to dark after standing.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet, transfer to a 10 ml volumetric flask with water, add water to volume, mix well, filter. Use the successive filtrate as test solution and carry out the procedure described under the Assay.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 150 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Place 2 tablets in each of 6 vessels. Withdraw 5 ml of the solution after exactly 60 minutes and filter. Use the successive filtrate as test solution. Dissolve an accurately weighed quantity of lofexidine hydrochloride CRS in water to produce a reference solution of 2.6 µg per ml. Carry out the procedure described under the Assay and calculate the dissolution of C₁₁H₁₂Cl₂N₂O · HCl from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.02 mol/L potassium dihydrogen phosphate solution (adjust to pH 3.2 with phosphoric acid)-acetonitrile (4 : 1) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of lofexidine hydrochloride.

Procedure Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powdered tablets equivalent to about 0.2 mg of lofexidine hydrochloride in a 10 ml volumetric flask, add 5 ml of water and with the aid of an ultrasonic bath for 10 minutes to dissolve lofexidine hydrochloride, dilute with water to volume, mix well, filter. Inject 10 µl of the successive filtrate into the column and record the chromatogram. Dissolve lofexidine hydrochloride CRS in water to produce a solution of 0.02 mg per ml. Repeat the operation, using lofexidine hydrochloride CRS instead of the substance being examined. Calculate the content of C₁₁H₁₂Cl₂N₂O · HCl with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Lofexidine Hydrochloride.

Strength 0.2 mg

Storage Preserve in tightly closed containers, stored in a dry place and protect from light.

Lomustine

C₉H₁₆ClN₃O₂ 233.70

[13010-47-4]

Lomustine is N-(2-chloroethyl)-N'-cyclohexyl-N-nitroso-urea. It contains not less than 97.0% and not more than 103.0% of C₉H₁₆ClN₃O₂, calculated on the dried basis.

Description A pale yellow crystalline powder; odourless. Freely soluble in chloroform; soluble in carbon tetrachloride or ethanol; sparingly soluble in cyclohexane; practically insoluble in water.

Melting point 88-91°C (Appendix VI C).

Identification (1) Dissolve 10-20 mg in 1 ml of ethanol, add 1 ml of a 1% solution of sulfanilamide in dilute hydrochloric acid. Heat in a water bath for 10 minutes, cool, add 2 ml of alkaline β-naphthol TS, an orange-red colour is produced.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 232 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of lomustine (Appendix XVI).

(4) Heat about 10 mg with 5 ml of sodium hydroxide TS in a water bath for 5 minutes, acidify with nitric acid, the solution yields the reactions characteristic of chlorides (Appendix III).

Chloride shake thoroughly 0.40 g with 40 ml of water and filter. Carry out the limit test for chlorides (Appendix VIII A), using 20 ml of the filtrate. Any opalescence is not more pronounced than that of a reference using 4.0 ml of sodium chloride standard solution (0.02%).

Related substances Protect from light throughout the procedure. Carry out the method for thin layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and toluene as the mobile phase. Apply separately to the plate 20 µl each of two solutions in chloroform containing (1) 10 mg per ml, (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). No spot other than the principal spot in the chromatogram obtained with solution (1) is more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight in vacuum over phosphorous pentoxide, loses not more than 0.5% of its weight (Appendix VII L).

Assay Protect from light throughout the procedure. Dissolve an accurately weighed quantity in cyclohexane to produce a solution of about 15 µg per ml. Measure the absorbance at 232 nm (Appendix IV A) and calculate the content of C₉H₁₆ClN₃O₂, taking 263 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, stored in a cold place and protected from light.

Preparation Lomustine Capsules

Lomustine Capsules

Lomustine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of lomustine ($C_9H_{16}ClN_3O_2$).

Identification Comply with the tests (1), (2) and (4) for Identification described under Lomustine, using the contents of the capsules.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Carry out the Assay described under Lomustine, using an accurately weighed quantity of the well mixed contents obtained in the test for weight variation of content.

Category, Storage As described under Lomustine.

Strength (1) 40 mg (2) 100 mg

Loperamide Hydrochloride

$C_{29}H_{33}ClN_2O_2 \cdot HCl$ 513.51

[34552-83-5]

Loperamide Hydrochloride is 4-(*p*-chlorophenyl)-4-hydroxy-*N*, *N*-dimethyl- α , α -diphenyl-1-piperidinebutyramide monohydrochloride. It contains not less than 98.0% and not more than 102.0% of $C_{29}H_{33}ClN_2O_2 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless; taste, bitter. Freely soluble in ethanol or glacial acetic acid; slightly soluble in water.

Identification (1) The light absorption of a solution of 0.4 mg per ml in methanol exhibits maxima at 265 nm, 259 nm and 253 nm.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of loperamide hydrochloride (Appendix XVI).

Chloride content Weigh accurately about 15 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 20 ml of 1 mol/L sodium hydroxide solution as the absorbing liquid. When the combustion is complete, shake the flask vigorously for 15 minutes, rinse the stopper and platinum wire with a small amount of water and add washings to the absorbing liquid. Add 1 drop of bromophenol blue IS, adjust with diluted nitric acid until the colour of the solution changes to yellow. Add 1 ml of diluted nitric acid, 20 ml of ethanol and 5 to 10 drops of a 1% solution of diphenylcarbazine in ethanol. Titrate with mercuric nitrate (0.005 mol/L) VS and shake vigorously towards the end point until the colour changes to pale rose-red. Perform a blank determination and make any necessary correction. Each ml of mercuric nitrate (0.005 mol/L) VS is equivalent to 0.3545 mg of chloride. The chloride content is not less than 13.52% and not more than 14.20%.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-formic acid (85 : 10 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in chloroform containing (1) 10 mg per ml, (2) 0.05 mg per ml. After developing and removal of the plate, dry it in air and expose it to iodine vapour until the spots appear. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and 10 ml of mercuric acetate TS, add 2 drops of naphtholbenzein IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 51.35 mg of $C_{29}H_{33}ClN_2O_2 \cdot HCl$.

Category Antidiarrheal.

Storage Preserve in tightly closed containers, protected from light.

Preparation Loperamide Hydrochloride Capsules

Loperamide Hydrochloride Capsules

Loperamide Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$).

Description Capsules containing a white or yellowish-white powder.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in the Assay.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer the contents and shell of 1 capsule to a 50 ml conical flask with stopper, add 20 ml of methanol, accurately measured, shake for 30 minutes. Centrifuge, use the supernatant liquid as the test solution. Carry out the procedure as described under the Assay. Calculate the content of $C_{29}H_{33}ClN_2O_2 \cdot HCl$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 150 ml of 0.004 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Use the successive filtrate as the test solution. Transfer 3 ml of reference solution obtained under the Assay, accurately measured, to a 25 ml volumetric flask, dilute with 0.004 mol/L hydrochloric acid solution to volume, mix well. Use this solution as the reference solution. Carry out the procedure as described under the Assay, calculate the dissolution of $C_{29}H_{33}ClN_2O_2 \cdot HCl$ from each capsule. Not less than 75 % of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L tetrabutylammonium hydrogen sulfate solution-acetonitrile-methanol (63 : 26 : 11) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of loperamide hydrochloride.

Reference solution Dissolve a quantity of loperamide hydrochloride CRS, accurately weighed, in methanol to produce a solution of 0.1 mg per ml.

Test solution Transfer the content and shells of 5 capsules to a conical flask with stopper, add 100 ml of methanol, accurately measured, shake for 30 minutes. Centrifuge at 3500 rpm for 5 minutes, use the supernatant liquid as the test solution.

Procedure Inject respectively 20 μ l of the reference solution and the test solution, accurately measured, into the column. Calculate the content of $C_{29}H_{33}ClN_2O_2 \cdot HCl$.

Category As described under Loperamide Hydrochloride.

Strength 2 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Lumefantrine

$C_{30}H_{32}Cl_3NO$ 528.94

Lumefantrine is α -(dibutylamino methyl)-2,7-dichloro-9-(*p*-chlorobenzene methylene)-4-fluorene methanol. It contains not less than 98.0% of $C_{30}H_{32}Cl_3NO$, calculated on the dried basis.

Description A yellow crystalline powder; odour, almond smell; tasteless. Freely soluble in chloroform; sparingly soluble in acetone, practically insoluble in ethanol or water.

Melting range 125-131°C (Appendix V C).

Identification (1) Transfer about 5 mg to a test tube, add 1 ml of citric-acetic anhydride TS, heat on a water bath, a violet colour is produced.

(2) Dissolve a quantity, accurately weighed, in ethanol on warming in a water bath to produce a solution of 10 μ g per ml. The light absorption of the solution exhibits four maxima at 234 nm, 266 nm, 301 nm and 335 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of lumefantrine (Appendix XVI).

Related substances Carry out the method for thin-layer

chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-hexane-acetone-diethylamine (80 : 14 : 6) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in chloroform containing (1) 10 mg per ml (2) 50 μ g per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) and not more than four spots are observed.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in test for Residue on ignition; not more than 0.002%.

Assay To about 0.5 g, accurately weighed, add 20 ml of acetic anhydride, shake to dissolve, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 52.89 mg of $C_{30}H_{32}Cl_3NO$.

Category Antimalarial agent.

Storage Preserve in tightly closed containers.

Lyophilizing Thrombin Powder

Lyophilizing Thrombin Powder is a sterile, lyophilized thrombin powder prepared by cativation of prothrombin extracted from bovine or porcine plasma for oral or local hemostases. It has a potency of not less than 10 Units per mg and contains not less than 80% of labelled amount of thrombin.

Description A white or almost white lyophilized mass or powder. A solution of 500 Units per ml in 0.9% sodium chloride solution is slightly opaque.

Loss on drying When dried in vacuum over phosphorus pentoxide in desiccator for four hours, loses not more than 3.0% of its weight, (Appendix VIII L).

Sterility Dissolve a quantity in 5 ml of 0.9% Sterile sodium chloride solution. Complies with the test for sterility (Appendix XI H).

Assay Preparation of fibrinogen solution Dissolve about 30 mg, accurately weighed, of the fibrinogen in 1.5 ml of 0.9% sodium chloride solution, add 0.1 ml of thrombin solution (about 3 Units), shake immediately and allow to stand at room temperature for 1 hour until coagulate completely. Take out the clot and wash it with water until the washing is clear with the addition of silver nitrate TS. Dry the clot at 105°C for 3 hours, weigh and calculate the percentage content of the clot in the fibrinogen. Prepare a fibrinogen solution containing 0.2% of clot with 0.9% sodium chloride solution, adjust to pH 7.0-7.4 with disodium hydrogen phosphate solution (0.05 mol/L), or sodium dihydrogen phosphate solution (0.05 mol/L), dilute with 0.9% sodium chloride solution to produce a solution containing 0.1% of clot.

Preparation of standard curve Dissolve a quantity of the thrombin RS in 0.9% sodium chloride solution to produce

solutions containing 5.0, 6.4, 8.0, 10.0 Units per ml. To each of 4 test tubes (10 mm × 100 mm) add, accurately measured, 0.9 ml of fibrinogen solution, and place the tubes in a water bath at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ for 5 minutes. Add, accurately measured, 0.1 ml of the standard solutions of the four different concentrations to the test tubes, respectively. Place the tubes in a water bath at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ immediately after shake. Record the initial clotting time. For each concentration, repeat the test five times and calculate the average clotting time (the test is fail if the deviation between the maximum and minimum of five determinations is more than 10% of the average value and repeat experiment again). Prepare standard solution of suitable concentration with reference to clotting time in a range of 14-60 seconds. Calculate the regression equation between logarithms of RS Units and logarithms of clotting time.

Procedure To each of accurately weighed contents of three containers according to the labelled amount, add 0.9% sodium chloride solution respectively, to produce test solutions with concentrations equivalent to the standard solutions. Measure accurately 0.1 ml of the test solution, and treated in the same manner as described under preparation of standard curve and calculate average clotting time (the requirement of deviation between the maximum and minimum is the same as described above). The thrombin Units is obtained from regression equation. Calculate thrombin Units per mg or per container of substance being examined as follows:

$$\begin{aligned}\text{thrombin Units/mg} &= U \times 10 \times V / W \\ \text{thrombin Units/container} &= U \times 10 \times V\end{aligned}$$

Where U is the real Units of 0.1 ml substance being examined obtained from standard curve;

V is the volume of dissolved contents in one container (ml);

W is the weight of the substance being examined in one container (mg);

10 is the factor from 0.1 ml to 1.0 ml.

Calculate the percentage of labelled potency of each container. If one container doesn't comply with the requirement (more than 80% of labelled potency), repeat the test using other three containers.

Category Local hemostat.

Strength available (1) 200 Units (2) 500 Units
(3) 1000 Units (4) 2000 Units
(5) 5000 Units (6) 10000 Units

Storage Preserve in tightly closed containers at a temperature not exceeding 10°C .

Lysine Acetate

$\text{C}_6\text{H}_{14}\text{N}_2\text{O}_2 \cdot \text{C}_2\text{H}_4\text{O}_2$ 206.24

Lysine Acetate is (S)-2,6-diaminohexanoic acid acetate. It contains not less than 98.5% of $\text{C}_6\text{H}_{14}\text{N}_2\text{O}_2 \cdot \text{C}_2\text{H}_4\text{O}_2$, calculated on the dried basis.

Description White crystals or crystalline powder; practically odourless.

Freely soluble in water, practically insoluble in ethanol.

Specific optical rotation $+8.5^{\circ}$ to $+10.0^{\circ}$, in a solution of about 0.10 g per ml in water (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of lysine acetate CRS (Appendix XVI).

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, pH 6.5-7.5 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 10.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VII K), using 0.25 g. Any colour produced is not more intense than that of a reference solution using 5.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and propanol-concentrated ammonia solution (67 : 33) as the mobile phase. Apply separately to the plate 5 μl each of two solutions of substance being examined in water containing (1) 20 mg per ml, (2) 40 μg per ml. After developing and removal of the plate, dry it in air and spray with ninhydrin acetone solution (1 → 50), heat at 80°C until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.2%).

Loss on drying When dried at 80°C for 3 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 2.0 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.01 EU per mg of 'lysine ace a e' (for paren'era' a 'mini tra' i n).

Assay Dissolve about 0.1 g, accurately weighed, in 3 ml of dehydrated acetic acid, add 30 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.31 mg of $\text{C}_6\text{H}_{14}\text{N}_2\text{O}_2 \cdot \text{C}_2\text{H}_4\text{O}_2$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Lysine Hydrochloride

$C_6H_{14}N_2O_2 \cdot HCl$ 182.65 [657-27-27]

Lysine is (L)-2,6-diamino caproic acid hydrochloride. It contains not less than 98.5% of $C_6H_{14}N_2O_2 \cdot HCl$, calculated on the dried basis.

Description White crystals or a white crystalline powder; odourless.

Freely soluble in water; very slightly soluble in ethanol, practically insoluble in ether.

Specific optical rotation $+20.0^\circ$ to $+21.5^\circ$, in a solution of 80 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Lysine hydrochloride (Appendix XVI).

(2) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 10 ml of water, pH 5.0-6.0 (Appendix VI H).

Transmittance of solution Dissolve 0.5 g in 10 ml of water, t_{40} is t_{10} than 9.0 Ap. ndix IV A).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), u.i.g 1.0 g. Any colour produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-propanol-ammonium solution (2 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions of the substance being examined in water containing (1) 16 mg per ml, (2) 80 μ g per ml. After developing and removal of the plate, dry it in air and spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone), heat at $80^\circ C$ until the colour is produced and examine immediately. Any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.5%).

Loss on drying When dried to the constant weight at $105^\circ C$ for 3 hours, loses not more than 0.4% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Iron Carry out the limit test for iron (Appendix VII G), using 0.50 g. Any colour produced is not more intense than that of a reference solution using 1.5 ml of iron standard solution (0.003%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH3.5). Carry out the limit test for heavy metals (Appendix VII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 10 EU per g of lysine hydrochloride (for parenteral administration).

Chloride Content Dissolve about 0.35 g, accurately weighed, in 20 ml of water, add 2 ml of dilute acetate acid and 8 to 10 drops of bromophenol blue IS, titrate with silver nitrate (0.1 mol/L) VS until the colour becomes to blue-violet. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl. It contains not less than 19.0% and not more than 19.6% of chloride, calculated on the dried basis.

Assay Weigh accurately about 80 mg, add 5 ml of mercuric acetate TS and 25 ml of glacial acetic acid, heat at $60-70^\circ C$ to dissolve, Carry out the method for potentiometric titration (Appendix VII A). Titrate with perchloric acid (0.1 mol/L) VS, perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 9.133 mg of $C_6H_{14}N_2O_2 \cdot HCl$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Mafenide Acetate

$C_7H_{10}N_2O_2S \cdot C_2H_4O_2$ 246.29 [13009-99-9]

Mafenide Acetate is α -amino-*p*-toluenesulfonamide monoacetate, it contains not less than 98.0% of $C_7H_{10}N_2O_2S \cdot C_2H_4O_2$.

Description White to pale yellow crystals or a crystalline powder; odour, acetic; the aqueous solution exhibits weak acidic reaction.

Freely soluble in water.

Melting point $163-167^\circ C$, determined as such without drying (Appendix VI C).

Identification (1) To 5 ml of the aqueous solution (1 \rightarrow 1000) add 5 ml of sodium hydroxide TS, mix, add 0.5 ml of freshly prepared 5% potassium naphthoquinone sulfonate solution; a yellowish-red colour is produced. Allow it to stand for 10 minutes, the solution turns to bluish-green on addition of 0.2 g of ammonium chloride (Distinction from other sulfonamides).

(2) Dissolve 0.2 g in 1 ml of water, add 0.5 ml of ammonia TS; white crystals are produced. Filter, wash the crystals with a small quantity of water and dry at $105^\circ C$ for 2-3 hours, it has a melting point of $151-154^\circ C$ (Appendix VI C). The filtrate yields the reactions characteristic of acetates (Appendix III).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mafenide acetate (Appendix XVI).

Acidity Dissolve 1.0 g in 10 ml of water, add 1 drop of methyl red IS; no red colour is produced.

Ammonium To the remaining solution obtained in the test

for Acidity add 5 ml of sodium hydroxide TS, heat in a water bath, the vapour evolved does not change a moistened red litmus paper to blue.

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.0015%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.63 mg of $C_7H_{10}N_2O_2S \cdot C_2H_4O_2$.

Category Sulfonamide.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Magnesium Oxide

MgO 40.30 [1309-48-4]

Magnesium Oxide contains not less than 96.5% of MgO, calculated with reference to substance freshly ignited to constant weight.

Description A white powder, odourless; tasteless; gradually absorbs carbon dioxide from the air. Practically insoluble in water; insoluble in ethanol; soluble in dilute acids.

Identification Its solution in dilute hydrochloric acid yields the reactions characteristic of magnesium salts (Appendix III).

Alkalinity Boil 1.0 g with 50 ml of water for 5 minutes. Filter while hot, wash the residue with a quantity of water. Combine the washings with the filtrate, add a few drops of methyl red IS and 2.0 ml of sulfuric acid (0.05 mol/L) VS, a red colour is produced.

Calcium oxide To about 0.5 g, accurately weighed after freshly ignited and cooled, add 6 ml of dilute hydrochloric acid, heat to dissolve and allow to cool. Add 300 ml of water and 5 ml of tartaric acid solution (1→5), then 10 ml of triethanolamine solution (3→10) and 10 ml of 45% potassium hydroxide solution. Allow to stand for 5 minutes, add 0.1 g of calcon indicator mixture, titrate with disodium edetate (0.01 mol/L) VS until the colour changes from purple to blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.01 mol/L) VS is equivalent to 0.5608 mg of CaO; not more than 0.50%.

Chloride Dissolve 0.10 g in 0.5 ml of nitric acid and sufficient water to produce 50 ml, mix well. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.14%).

Sulfate Dissolve 0.25 g in 2 ml of hydrochloric acid and sufficient water to produce 50 ml. Carry out the limit test for sulfates (Appendix VIII B), using 20 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.3%).

Carbonate Boil 0.10 g with 5 ml of water, cool, add 5 ml of acetic acid, no effervescence occurs.

Acid insoluble substances Add 75 ml of water to 2.0 g and then add hydrochloric acid in small portions with stirring until no more of the substance being examined is dissolved. Boil the solution for 5 minutes and filter. Wash the residue with water until the washing shows no reaction of chlorides. Ignite the residue to constant weight. The residue is not more than 2.0 mg (0.10%).

Loss on ignition When ignited to constant weight, loses not more than 5.0%, using 0.5 g.

Iron Dissolve 50 mg in 2 ml of dilute hydrochloric acid and 23 ml of water. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 2.5 ml of iron standard solution (0.05%).

Manganese To 1.0 g add 20 ml of water, 5 ml of nitric acid, 5 ml of sulfuric acid and 1 ml of phosphoric acid, boil for 2 minutes, cool to room temperature. Add 2.0 g of potassium periodate and boil again for 5 minutes, cool to room temperature. Transfer the solution to a 50 ml Nessler cylinder, dilute to volume with non-reducing water (add 3 ml of nitric acid and 5 g of potassium periodate to 1000 ml of water, boil for 2 minutes and cool), mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner, using 0.30 ml of manganese standard solution (dissolve 0.275 g of anhydrous manganese sulfate previously ignited to constant weight at 400–500°C in a 1000 ml volumetric flask, with water dilute to volume and mix well. Each ml of the resulting solution is equivalent to 0.10 mg of Mn) (0.003%).

Heavy metals Dissolve by heating 0.50 g with 10 ml of dilute hydrochloric acid and 5 ml of water, boil for 1 minute, allow to cool and filter. To the filtrate add 1 drop of phenolphthalein IS and add dropwise ammonia TS until the solution becomes pink. Add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml, add 0.5 g of ascorbic acid and shake to dissolve. Carry out the limit test for heavy metals (Appendix VIII H, method 1), compare the colour after 5 minutes; not more than 0.004%.

Arsenic Dissolve 0.40 g in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0005%.

Assay Dissolve 0.5 g, accurately weighed, in 30 ml of sulfuric acid (0.5 mol/L) VS, accurately measured, add 1 drop of methyl orange IS. Titrate with sodium hydroxide (1 mol/L) VS. The quantity of sulfuric acid consumed by MgO is calculated by subtracting the quantity consumed by CaO from the total amount of sulfuric acid consumed. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 20.15 mg of MgO or 28.04 mg of CaO.

Category Antiacids.

Storage Preserve in tightly closed containers.

Magnesium Salicylate

$C_{14}H_{10}MgO_6 \cdot 4H_2O$ 370.60

[18917-89-0]

Magnesium Salicylate is *bis* (2-hydroxybenzoic acid- O^1 , O^2) magnesium tetrahydrate. It contains $C_{14}H_{10}MgO_6 \cdot 4H_2O$ not less than 98.0% and not more than 103.0%, calculated on the dried basis.

Description A white crystalline powder; odourless; efflorescent; aqueous solution yields slight acid reaction. Freely soluble in ethanol, soluble in water.

Identification (1) The light absorption of a solution obtained in the Assay exhibits a maximum at 296 nm (Appendix IV A). (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of magnesium salicylate (Appendix VI). (3) The aqueous solution yields the reactions characteristic of magnesium salts and salicylates (Appendix III).

Magnesium Weigh accurately about 0.8 g, in a 200 ml volumetric flask, add a quantity of water, shake for 15 minutes, dilute with water to volume, mix well, filter. Measure accurately 50 ml of the successive filtrate to a 250 ml conical flask, add 50 ml of water, 5 ml of ammonia-ammonium chloride BS (pH 10.0) and a small quantity of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS, until the colour changes from purplish-red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 1.215 mg of Mg. The amount of Mg is not less than 7.9% and not more than 8.3%, calculated on the dried basis.

Loss on drying When dried to constant weight at 105°C for 4 hours, loses 17.5%–20.0% of its weight (Appendix VII L).

Heavy metals Dissolve 0.50 g in 20 ml of water, add 2 ml of acetate BS (pH 3.5) and water to 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.004%.

Assay Dissolve a quantity, accurately weighed, in water to produce a solution of about 20 µg of anhydrous magnesium salicylate per ml. Repeat the operation using magnesium salicylate CRS, treat in the same manner to produce a solution of about 20 µg per ml of anhydrous magnesium salicylate. Measure the absorbance of the two solutions at 296 nm (Appendix IV A), calculate the content of $C_{14}H_{10}MgO_6$.

Category Anti-inflammatory and analgesic non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers.

Preparation (1) Magnesium Salicylate Capsules
(2) Magnesium Salicylate Tablets

Magnesium Salicylate Capsules

Magnesium Salicylate Capsules contain not less than 95.0% and not more than 105.0% of the labelled amount of anhydrous Magnesium Salicylate ($C_{14}H_{10}MgO_6$).

Identification A quantity of the contents of capsules complies with the tests (1) and (3) for Identification described under Magnesium Salicylate.

Loss on drying When dried for 4 hour at 105°C, loses not less than 17.5% and not more than 20.0% of its weight. (Appendix VII L)

Dissolution Comply with the dissolution test as described under Magnesium Salicylate Tablets.

Other requirements comply with the general requirements for capsules (Appendix I E).

Assay Dissolve the mixed contents obtained from the test for weight variation of contents, accurately weighed with water to produce a solution of 20 µg of anhydrous magnesium salicylate per ml. Carry out the Assay as described under Magnesium Salicylate, beginning at the words "Repeat the operation using magnesium salicylate CRS..." Calculate the content of $C_{14}H_{10}MgO_6$ in each capsule.

Category As described under Magnesium Salicylate.

Strength 0.25 g (calculated as $C_{14}H_{10}MgO_6$)

Storage Preserve in tightly closed containers.

Magnesium Salicylate Tablets

Magnesium Salicylate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of anhydrous magnesium salicylate ($C_{14}H_{10}MgO_6$).

Description White tablets.

Identification (1) The light absorption of the solution obtained in Assay exhibits maximum at 296 nm (Appendix IV A). (2) Powdered one tablet, add water to dissolve magnesium salicylate, filter. The filtrate yields the reactions characteristic of magnesium salts and salicylates salts (Appendix III).

Dissolution Carry out the method for dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, Adjust the rotation speed at 50 rpm. Withdraw 10 ml of the solution after exactly 45 minutes, filter. Measure accurately a quantity of the successive filtrate, dilute with water to produce a solution of 20 µg per ml. Proceed the Assay described under Magnesium Salicylate, beginning at the words "Repeat the operation using magnesium salicylate CRS..." Calculate the dissolution of $C_{14}H_{10}MgO_6$ from each tablet. The amount of magnesium salicylate dissolved in 45 minutes is not less than 80% of the labelled amount.

Other requirements Comply with the general requirements for tablets. (Appendix I A).

Assay Weigh and powder 20 tablets. Dissolve a quantity of the powder equivalent to about 0.5 g of anhydrous magnesium salicylate, accurately weighed, in 250 ml volumetric flask in water by shaking, dilute to volume, and mix well. Filter, and discard initial filtrate, measure accurately 2 ml of the successive filtrate to 200 ml volumetric flask, dilute with water to volume and mix well. Carry out the method described under the Assay for Magnesium Salicylate beginning at the word "Repeat the operation using magnesium salicylate CRS...". Measure the absorbances of two solutions at 296 nm, calculate the content of $C_{14}H_{10}MgO_6$.

Category As described under Magnesium Salicylate.

Strength 0.25 g (calculate as $C_{14}H_{10}MgO_6$)

Storage Preserve in tightly closed containers.

Magnesium Sulfate

$MgSO_4 \cdot 7H_2O$ 246.48

[7487-88-9]

Magnesium Sulfate contains not less than 99.5% of $MgSO_4$, calculated with reference to the substance ignited to constant weight.

Description Colourless crystals, odourless; taste, bitter

and salty; efflorescent.

Freely soluble in water; practically insoluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of magnesium salts and sulfates (Appendix III).

Acidity or alkalinity Dissolve 5.0 g in 50 ml of water, add 3 drops of bromothymol blue IS. If the solution is yellow, add 0.10 ml of sodium hydroxide (0.02 mol/L) VS, the colour changes to bluish-green. If the solution is bluish-green or green, it changes to yellow on adding of 0.10 ml of hydrochloric acid (0.02 mol/L) VS.

Clarity of solution Dissolve 2.5 g in 20 ml of water by shaking, the solution is clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Chloride Carry out the limit test for chlorides (Appendix VIII H), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Loss on ignition Weigh accurately 1.0 g, dry at 105°C for 2 hours, then ignite at 450°C ± 25°C to constant weight, loses not less than 48.0% and not more than 52.0% of its weight.

Iron Boil 2.0 g with 5 ml of nitric acid (1 → 10) for 1 minute, cool, dilute with water to produce 35 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution prepared in the same manner using 3.0 ml of iron standard solution (0.0015%).

Heavy metals Dissolve 2.0 g in 10 ml of water, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml, then add 0.5 g of ascorbic acid. Carry out the limit test for heavy metals (Appendix VIII H, method 1), compare the colour after standing for 5 minutes; not more than 0.001%.

Arsenic Dissolve 1.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.25 g, accurately weighed, in 30 ml of water, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a small quantity of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purplish-red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 6.018 mg of MgSO_4 .

Category Laxative and choleric.

Storage Preserve in tightly closed containers.

Preparation Magnesium Sulfate Injection

Magnesium Sulfate Injection

Magnesium Sulfate Injection is a sterile solution of magnesium sulfate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of Magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$).

Description A colourless, clear liquid.

Identification Yields the reactions characteristic of magnesium salts and sulfates (Appendix III).

pH value 5.0-7.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.03 EU per mg of magnesium sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to 0.5 g of magnesium sulfate into a 50 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 25 ml of the solution to complete the assay described under Magnesium Sulfate, beginning at the words "add 10 ml of ammonia-ammonium chloride BS (pH 10.0)...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 12.32 mg of $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$.

Category Laxative, choleric and anticonvulsant agent.

Strength (1) 10 ml : 1 g (2) 10 ml : 2.5 g

Storage Preserve in well closed containers, protected from light.

Magnesium Trisilicate

[14987-04-3]

Magnesium Trisilicate is a hydrated magnesium silicate with varying Components. It contains not less than 20.0% of MgO and not less than 45.0% of SiO_2 . The ratio of SiO_2 to MgO is 2.1-2.3.

Description A white fine powder with no sandy feeling; odourless; tasteless; slightly hygroscopic. Insoluble in water or ethanol.

Identification (1) Prepare a bead by fusing a few crystals of sodium ammonia phosphate on a platinum loop in the non-luminous flame. Place the hot, transparent bead in contact with the substance being examined and fuse again; silica floats about in the bead and an opaque bead with a web-like structure is produced upon cooling.

(2) Mix about 0.5 g with 10 ml of dilute hydrochloric acid, filter and neutralize the filtrate with ammonia TS; the filtrate yields reactions characteristic of magnesium salts (Appendix III).

Acid-consuming capacity Weigh accurately about 0.30 g into a glass-stoppered conical flask. Add accurately 50 ml of hydrochloric acid (0.1 mol/L) VS and 50 ml of water. Heat the flask in a water bath at 37°C for 2 hours, shake the mixture occasionally but leave it undisturbed during the last 15 minutes, cool. To 50 ml of the supernatant liquid add 1 drop of methyl orange IS and titrate the excess acid with sodium hydroxide (0.1 mol/L) VS. 1 g of magnesium trisilicate, calculated on the ignited basis, consumes not less than 140 ml and not more than 170 ml of hydrochloric acid (0.1 mol/L) VS.

Free alkali Boil 2.0 g with 30 ml of water for 15 minutes and filter with 2-3 layers of filter paper. Wash the residue with water in portions, combine the washings and filtrate, dilute to 50 ml with water and mix well. Add 2 drops of phenolphthalein IS to 25 ml of the solution; if a pink colour is produced, not more than 1.0 ml of hydrochloric acid (0.1 mol/L) VS is required to discharge it.

Chloride Boil 0.50 g with 5 ml of dilute nitric acid and 30 ml of water, cool, add water to produce 50 ml, mix well. Allow it to stand for 30 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A) using 10 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfate Boil 0.10 g with 5 ml of dilute hydrochloric acid and 30 ml of water, cool and filter. Carry out the limit test for

sulfates (Appendix VIII B) using the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution 0.5%.

Soluble salts Evaporate 25 ml of the filtrate obtained in the test for free alkali to dryness and ignite to constant weight. The weight of the residue is not more than 15 mg.

Loss on ignition Weigh accurately about 0.5 g, ignite to constant weight at 700-800°C, loses not more than 30.0% of its weight (Appendix VIII N).

Heavy metals Boil 3.0 g with 5 ml of hydrochloric acid and 40 ml of water for 20 minutes, cool, add 2 drops of phenolphthalein IS and concentrated ammonia TS until a pink colour is produced. Add 1 ml of hydrochloric acid (0.1 mol/L) VS to make it slightly acid. Filter and wash the residue with small amount of water in portions, combine the washings and filtrate. Add ammonia TS dropwise until a pink colour is produced, add 8 ml of hydrochloric acid (0.1 mol/L) VS and sufficient quantity of water to produce 75 ml, mix well. Carry out the limit test for heavy metals (Appendix VIII H, method 1) using 25 ml; not more than 0.002%.

Arsenic Dissolve 0.40 g in 23 ml of water, add 5 ml of hydrochloric acid, it complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0005%).

Assay Magnesium Oxide To about 1.5 g accurately weighed, add 50 ml of sulfuric acid (0.5 mol/L) VS, accurately measured, heat on a water bath for 15 minutes and allow to cool. Add 1 drop of methyl orange IS, titrate with sodium hydroxide (1 mol/L) VS. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 20.15 mg of MgO.

Silicon Dioxide To about 0.4 g, accurately weighed, in a porcelain dish add a mixture of 3 ml of sulfuric acid and 5 ml of nitric acid, heat gently until the reaction is complete. Evaporate on a sand-bath to dryness, allow to cool. Add 10 ml of dilute sulfuric acid and 100 ml of water, boil to dissolve the magnesium salt. Decant the supernatant liquid through an ashless filter paper, wash the residue by decantation for three times with hot water and filter the washings. Finally transfer the residue to the filter paper, wash it with hot water. Transfer the filter paper and its contents to a platinum crucible, dry, incinerate, and ignite for further 30 minutes, cool and weigh accurately. Moisten the residue with water, add 3 ml of hydrofluoric acid and 3 drops of sulfuric acid. Evaporate to dryness, ignite for 5 minutes, cool, and weigh: the loss in weight represents the weight of SiO₂ in the substance being examined.

Category Antiacid.

Storage Preserve in tightly closed containers.

Malaridine Phosphate

$C_{23}H_{32}ClN_5O_2 \cdot 4H_3PO_4$ 910.04

Malaridine Phosphate is 10 [[3',5'-bis (1-pyrrolidylmethyl)-4'-hydroxyphenyl]-amino]-2-methoxy-7-chloro-benzo [b]-1,5-naphthyridine tetrphosphate. It contains not less than 98.0% and not more than 102.0% of $C_{23}H_{32}ClN_5O_2 \cdot 4H_3PO_4$, calculated on the dried basis.

Description A yellow to orange-yellow crystalline powder; odourless; taste, bitter; hygroscopic. Soluble in water; practically insoluble in ethanol or ether.

Identification (1) Dissolve about 10 mg in 1 ml of water, add a few drops of trinitrophenol TS, a yellow precipitate is produced.

(2) The light absorption of a solution of 10 µg per ml in phosphate BS (pH 7.0) exhibits two maxima at 260 nm and 276 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of malaridine phosphate (Appendix XVI).

(4) Dissolve about 20 mg in 5 ml of water, add ammonia TS to precipitate completely, filter. The filtrate yields the reactions characteristic of phosphates (Appendix III).

Acidity Dissolve 1.0 g in 25 ml of water, the pH value is up to 2.4 (Appendix VI H).

Water-insoluble substances Dissolve 2.0 g in 25 ml of water, shake thoroughly. Allow to stand for 30 minutes, filter with a No.4 sintered glass crucible, previously dried to constant weight at 105°C. Wash the precipitate with 15 ml of water in portions. Dry at 105°C for 4 hours, the residue obtained is not more than 4 mg (for injection) or 7 mg (for oral administration).

Chloride Dissolve 0.1 g in 4 ml of water, add 5 ml of 20% sodium carbonate solution to precipitate completely. Filter with a No.5 sintered glass crucible, wash the precipitate with 15 ml of water in portions. Combine the filtrate and washings, dilute with water to 25 ml. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution, using 3.0 ml of sodium chloride standard solution (0.03%).

Formaldehyde Dissolve 50 mg in 2 ml of water, add 4 ml of 5% sodium carbonate solution, stir and filter. add 3 ml of sulfuric acid solution (1→2) to the filtrate and allow to cool. Add 5 ml of fuchsin-sulfurous acid TS and warm at 20-30°C for 30 minutes. any colour produced is not more intense than that of 1.0 ml of a freshly prepared 0.10 mg per ml formaldehyde reference solution 0.1 mg per ml and treated in the same manner (0.2%).

Tetrahydropyrrole Dissolve 10 mg in 2 ml of water, add 2 ml of 5% sodium carbonate solution, stir and filter. Add 1 ml of freshly prepared sodium nitroprusside-acetaldehyde TS to the filtrate, mix well, no bluish-violet colour is developed within 5 minutes.

Loss on drying When dried to constant weight at 105°C, loses not more than 4.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.2 g, accurately weighed, in 40 ml of glacial acetic acid by warming and then cool. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1mol/L) VS. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 30.33 mg of $C_{23}H_{32}ClN_5O_2 \cdot 4H_3PO_4$.

Category Antimalarial agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Malaridine Phosphate Injection

(2) Malaridine Phosphate Enteric-coated Tablets

Malaridine Phosphate Injection

Malaridine Phosphate Injection is a sterile solution of malaridine phosphate in Water for Injection. It contains not less than 94.0% and not more than 106.0% of the labelled amount of malaridine ($C_{29}H_{32}ClN_5O_2$).

Description An orange-red and clear liquid.

Identification Complies with the tests (1), (2) and (4) for Identification described under Malaridine Phosphate.

pH value 2.3-4.0 (Appendix VI H).

Pyrogens Dilute with sodium chloride injection or 5% glucose injection to produce a solution of 1.0 mg of malaridine per ml. The solution complies with the requirement of the test for pyrogens (Appendix XI D), using 10 ml per kg of the rabbit's weight, injected slowly.

Sterility Complies with the test for sterility (Appendix XI H), treated with the membrane filtration method.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity with phosphates BS (pH 7.0) to produce a solution of 10 µg of malaridine phosphate per ml in an amber coloured flask. Carry out the Assay as described under Malaridine Phosphate Tablets.

Category As described under Malaridine phosphate.

Strength 2 ml : 80 mg (calculated on malaridine)

Storage Preserve in well closed containers, protected from light and stored in a cool and dark place.

Malaridine Phosphate Enteric-coated Tablets

Malaridine Phosphate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of malaridine ($C_{29}H_{32}ClN_5O_2$).

Description Enteric film coated tablets with yellow core.

Identification A quantity of the powdered tablets complies with the test (1), (2) and (4) for Identification described under malaridine phosphate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with coating removed. Dissolve an accurately weighed quantity of the powdered tablets equivalent to about 10 mg of malaridine phosphate in a 100 ml amber coloured volumetric flask with phosphate BS (pH 7.0), dilute to volume and mix well. Filter quickly, discard the initial filtrate and collect the successive filtrate. Measure accurately 5 ml each of the reference preparation and test preparation to a 50 ml amber coloured volumetric flask separately, add phosphate BS (pH 7.0) to volume, mix well. Measure the light absorbance of the resulting solutions at 260 nm (Appendix IV A). Dissolve a quantity of malaridine phosphate CRS, accurately weighed, in an amber coloured volumetric flask with phosphate BS (pH 7.0) and dilute to produce a solution of 10 µg per ml. Repeat the operation. Calculate the content of

$C_{29}H_{32}ClN_5O_2 \cdot 4H_3PO_4$ and multiply the result by 0.569.

Category As described under Malaridine Phosphate.

Strength 0.1 g (calculated on malaridine)

Storage Preserve in tightly closed containers, protected from light.

Mannitol

$C_6H_{14}O_6$ 182.17

[69-65-8]

Mannitol is D-mannitol. It contains not less than 98.0% and not more than 102.0% of $C_6H_{14}O_6$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, sweetish.

Freely soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Melting range 166-170°C (Appendix VI C).

Identification (1) To about 0.5 g in a test tube add 3 ml of acetyl chloride and add dropwise 0.5 ml of pyridine with shake until the reaction is complete. Cool with ice and filter. Wash the crystals with 10 ml of ether and dissolve the crystals in another test tube with 15 ml of ether by warming in a water bath. Decant the ether solution while warm and evaporate the solvent; white crystals are obtained (if necessary, recrystallize again). After drying, the melting range of the crystals is 120-125°C (Appendix VI C).

(2) To 1 ml of the saturated aqueous solution of the substance being examined add 0.5 ml each of ferric chloride TS and sodium hydroxide TS; a brownish-yellow precipitate is produced which is unchanged on shake but dissolved in an excess of sodium hydroxide TS to form a brown solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mannitol (Appendix XVI).

Acidity Dissolve 5.0 g in 50 ml of freshly boiled and cooled water, add 3 drops of phenolphthalein IS and 0.30 ml of sodium hydroxide (0.02 mol/L) VS; a pink colour is produced.

Clarity and colour of solution A solution of 1.5 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of sodium chloride standard solution (0.003%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.01%).

Oxalate Dissolve 1.0 g in 6 ml of water by warming, cool, add 3 drops of ammonia TS and 1 ml of calcium chloride TS, mix well, warm in a water bath for 15 minutes and cool. Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner using 2.0 ml of sodium oxalate standard solution [Dissolve 0.1523 g of sodium oxalate with a quantity of water in a 1000 ml

volumetric flask, dilute with water to volume and mix well. Each ml is equivalent to 0.1 mg of oxalate (C_2O_4)] (0.02%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 1.0 g in 10 ml of water, add 5 ml of dilute sulfuric acid and 0.5 ml of potassium bromide-bromine TS, warm on a water bath for 20 minutes (if necessary, add dropwise potassium bromide-bromine TS to keep it slightly in excess) and add water to replace the water evaporated. Cool, add 5 ml of hydrochloric acid and a quantity of water to produce 28 ml, carry out the limit test for arsenic (Appendix VIII J, method 1); it complies with the requirement (0.0002%).

Assay Dissolve about 0.2 g, accurately weighed, in water in a 250 ml volumetric flask, add water to volume and mix well. Measure accurately 10 ml to an iodine flask, add accurately 50 ml of sodium (potassium) periodate solution [mix 90 ml of sulfuric acid solution (1→20) with 110 ml of sodium (potassium) periodate solution (2.3 → 1000)], warm on a water bath for 15 minutes and cool. Add 10 ml of potassium iodide TS, stopper the flask and allow to stand for 5 minutes. Titrate with sodium thiosulfate (0.05 mol/L) VS, add 1 ml of starch IS towards the end of titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.05 mol/L) VS is equivalent to 0.9109 mg of $C_{20}H_{23}N$.

Category Dehydrant, diuretic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Mannitol Injection

Mannitol Injection

Mannitol Injection is a sterile solution of mannitol in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of mannitol ($C_6H_{14}O_6$).

Description A clear, colourless liquid.

Identification (1) Evaporate 2.5 ml on a water bath to dryness and then dry at 105°C, the residue complies with test (1) for Identification described under Mannitol, and has a melting range of 120-125°C.

(2) Complies with test for Identification (2) described under Mannitol, using 1 ml.

pH value 4.5-6.5 (Appendix VI H).

Bacterial Endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 2.5 EU per mg of mannitol.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately quantity (equivalent to about 2.0 g of mannitol), in a 100 ml volumetric flask, add water to volume and mix well. Transfer 10 ml, accurately measured, to a 250 ml volumetric flask, add water to volume and mix

well. Carry out the Assay described under Mannitol, beginning at the words "Measure accurately 10 ml to an iodine flask, ..". Each ml of sodium thiosulfate (0.05 mol/L) VS is equivalent to 0.9109 mg of $C_6H_{14}O_6$.

Category As described under Mannitol.

Strength (1) 20 ml : 4 g (2) 50 ml : 10 g
(3) 100 ml : 20 g (4) 250 ml : 50 g
(5) 500 ml : 100 g (6) 3000 ml : 150 g

Storage Preserve in well closed containers, protected from light.

Maprotiline Hydrochloride

$C_{20}H_{23}N \cdot HCl$ 313.87

[10347-81-6]

Maprotiline Hydrochloride is N-methyl-9,10-ethanoanthracene-9 (10H)-propylamine hydrochloride. It contains not less than 99.0% of $C_{20}H_{23}N \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Freely soluble in methanol or chloroform, slightly soluble in water, insoluble in heptane.

Identification (1) Dissolve about 5 mg in 5 ml of water, add a few drops of potassium iodobismuthate TS, an orange-yellow precipitate is produced immediately.

(2) The light absorption of a solution of 100 µg per ml in water exhibits two maxima at 264 and 271 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of maprotiline hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance (previously elute the plate with chloroform and dry at 100°C for 30 minutes) and a mixture of isobutanol-ethyl acetate-2 mol/L ammonium hydroxide solution (6 : 3 : 1) as the mobile phase (place a beaker containing 4 ml of concentrate ammonia solution on the bottom of the chamber, add the mobile phase into the chamber and allow it to equilibrate for 1 hour). Apply separately to the plate 15 µl of each of four solutions in methanol containing (1) 20 mg per ml, (2) 0.2 mg per ml, (3) 0.1 mg per ml, (4) 0.05 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and expose the plate to hydrogen chloride vapour for 30 minutes, place it under the ultraviolet light at 254 nm for 10 minutes. Examine under ultraviolet light at 365 nm, any spots other than the principal spot in the chromatogram obtained with solution (1) are not more than 2 spots, and the sum of any secondary spots obtained with solution (1) is not more than 1.0% by comparing the intensity of the principal spots obtained with solution (2), (3), (4).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.001%.

Assay Dissolve about 0.25 g, accurately weighed, in 25 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) is equivalent to 31.39 mg of $C_{20}H_{23}N \cdot HCl$.

Category Antidepressant.

Storage Preserve in tightly closed containers.

Preparation Maprotiline Hydrochloride Tablets

Maprotiline Hydrochloride Tablets

Maprotiline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of maprotiline hydrochloride ($C_{20}H_{23}N \cdot HCl$).

Description White or almost white tablets.

Identification (1) To a quantity of powdered tablets add a quantity of water, shake to dissolve maprotiline hydrochloride. Filter, the filtrate complies with tests (1), (2) and (4) for Identification described under Maprotiline Hydrochloride.

(2) To a quantity of powdered tablets, equivalent to about 100 mg of maprotiline hydrochloride, add 5 ml of methanol, shake to dissolve maprotiline hydrochloride, centrifuge, using the supernatant liquid as the test solution. Dissolve a quantity of maprotiline hydrochloride CRS in methanol to produce a solution of 20 mg per ml as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance (previously elute the plate with chloroform and dry at 100°C for 30 minutes) and a mixture of isobutanol-ethyl acetate-2 mol/L ammonium hydroxide solution (6 : 3 : 1) as the mobile phase (place a beaker containing 4 ml of concentrated ammonia solution in the bottom of the chamber, add the mobile phase into the chamber and allow it to equilibrate for 1 hour). Apply separately to the plate 5 µl of each of above two solutions, after developing and removal of the plate, dry in air and expose the plate to hydrogen chloride vapour for 30 minutes, place it under the ultra violet light at 254 nm for 10 minutes. Examine under ultra violet light at 365 nm, the position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with the reference solution.

Content uniformity Comply with the requirements (Appendix X E). Shake 1 tablet with about 60 ml of 0.05 mol/L hydrochloric acid solution in a 100 ml volumetric flask to dissolve maprotiline hydrochloride, proceed as described under Assay, beginning at the word "shake to dissolve maprotiline hydrochloride...", calculate the content of $C_{20}H_{23}N \cdot HCl$.

Dissolution Carry out dissolution test (Appendix X C, method 1), using 500 ml of 0.01 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 20 minutes and filter, using the successive filtrate as the test solution. Dissolve a quantity of maprotiline hydrochloride CRS, accurately weighed, in a

quantity of 0.01 mol/L hydrochloric acid solution, and dilute with 0.01 mol/L hydrochloric acid solution to volume to produce a solution of 50 µg per ml as reference solution. Measure accurately 1 ml each of the solutions to two 15 ml test tubes with stopper, to each test tube add 6 ml of phosphate BS (pH 3.5), 1 ml of bromocresol green solution, and, accurately measured, 5 ml of chloroform, shake for 2 minutes and allow to stand for 30 minutes. Measure the absorbance of the chloroform layer at 415 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{23}N \cdot HCl$ from each tablet; not less than 75% of the labelled amount is dissolved.

Assay Reference preparation Dissolve about 25 mg of maprotiline hydrochloride CRS, accurately weighed, in a 100 ml volumetric flask in a quantity of 0.05 mol/L hydrochloric acid solution and dilute with the same solvent to volume, mix well. Transfer 3 ml of the solution, accurately measured, to another 100 ml volumetric flask, dilute with phosphate BS (pH 3.5) to volume and mix well.

Test preparation Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets, equivalent to about 25 mg of maprotiline hydrochloride, to a 100 ml volumetric flask, add 60 ml of 0.05 mol/L hydrochloric acid solution, shake to dissolve maprotiline hydrochloride, dilute with the same solvent to volume and mix well. Filter, transfer 3 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with phosphate BS (pH 3.5) [dissolve 13.61 g of potassium dihydrogen phosphate in a quantity of water, add 50 ml of 0.1 mol/L hydrochloric acid solution, dilute with water to 2000 ml] to volume and mix well.

Procedure Transfer 5 ml each of the two solutions, accurately measured, to separate 15 ml test tubes with stopper, to each test tube add 2 ml of phosphate BS (pH 3.5), 1 ml of bromocresol green solution [tritrate 0.35 g of bromocresol green with 5 ml of 0.1 mol/L sodium hydroxide solution to dissolve it and transfer it to a 250 ml volumetric flask, dilute with water to volume, mix well and filter, the filtrate is ready for use], and 5 ml of chloroform, accurately measured, shake for 2 minutes, allow to stand for 30 minutes. Measure the absorbance of the chloroform layer at 415 nm (Appendix IV A). Perform a blank determination of the chloroform solution, treated in the same manner. Calculate the content of $C_{20}H_{23}N \cdot HCl$.

Category As described under Maprotiline Hydrochloride.

Strength 25 mg

Storage Preserve in tightly closed containers.

Mebendazole

$C_{16}H_{13}N_3O_3$ 295.30

[31431-39-7]

Mebendazole is (5-benzoyl-1H-benzimidazol-2-yl)-carbamic acid methyl ester. It contains not less than 98.0% and not more than 102.0% of $C_{16}H_{13}N_3O_3$, calculated on the dried basis.

Description A white, almost white or faintly yellow crystalline powder; odourless.

Freely soluble in formic acid; sparingly soluble in glacial acetic acid; very slightly soluble in acetone or chloroform; insoluble in water.

Specific absorbance Dissolve about 50 mg, accurately weighed, in 5 ml of formic acid. Dilute with isopropanol to produce a solution of 10 µg per ml. Measure the absorbance at 312 nm (Appendix IV A), the value of A (1%, 1 cm) is 485-505.

Identification (1) Dissolve about 50 mg, accurately weighed, in 5 ml of formic acid, dilute with isopropanol to produce a solution of 10 µg per ml. The light absorption exhibits a maximum at 312 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mebendazole (Appendix XVI).

Polymorph A Weigh accurately about 25 mg each of the substance being examined and mebendazole CRS which contains about 10% of polymorph A. Triturate with 0.3 ml of liquid paraffin separately to form smooth creamy pastes. Mount the mull of about 0.15 mm in thickness between rock salt plates, using a blank liquid paraffin mull as reference. Carry out the method for infrared spectrophotometry (Appendix IV C). Record the infrared spectra over the range 620-803 cm^{-1} under the condition that the transmission of the substance being examined and mebendazole CRS at 803 cm^{-1} is 90%-95%. Draw a baseline between the minimum absorption occurring at 620 cm^{-1} and 803 cm^{-1} and lines from peaks at 640 cm^{-1} and 662 cm^{-1} perpendicular to the base line. Measure the corrected peak heights of the maxima at about 640 cm^{-1} and 662 cm^{-1} . Calculate the ratio of the peak heights of the maximum at about 640 cm^{-1} to that of the maximum at about 662 cm^{-1} . The peak height ratio of the substance being examined is not greater than that of mebendazole CRS containing 10% of polymorph A.

Related substances Dissolve about 50 mg, accurately weighed, in 2 ml of formic acid in a 10 ml volumetric flask, dilute with acetone to volume [solution (1)]. Transfer 1 ml, accurately measured, to a 200 ml volumetric flask, dilute with acetone to volume [solution (2)]. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substances and a mixture of chloroform-methanol-formic acid (90 : 5 : 5) as the mobile phase. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry and examine under ultraviolet light at 254 nm. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition: not more than 0.002%.

Assay Dissolve about 0.25 g, accurately weighed, in 8 ml of formic acid, add 40 ml of glacial acetic acid and 5 ml of acetic anhydride. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid VS (0.1 mol/L). Perform a blank determination and make any necessary correction. Each ml of perchloric acid VS (0.1 mol/L) is equivalent to 29.58 mg of $\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_3$.

Category Anthelmintic.

Storage Preserve in tightly closed containers.

Preparation (1) Mebendazole Tablets
(2) Compound Mebendazole Tablets

Mebendazole Tablets

Mebendazole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Mebendazole ($\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_3$).

Description White or almost white tablets, or colouring tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 20 mg of mebendazole add 2 ml of formic acid, shake thoroughly. Add 18 ml of acetone, mix well and filter [solution (1)]. Dissolve about 20 mg of mebendazole CRS in 2 ml of formic acid, add 18 ml of acetone, mix well [solution (2)]. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-formic acid (90 : 5 : 5) as the mobile phase. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with solution (1) is identical in position to that obtained with solution (2).

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 312 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 1% sodium laurylsulfate in 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 120 minutes and filter. Take the successive filtrate as the test solution. Dissolve 25 mg of mebendazole CRS, accurately weighed, with 10 ml formic acid and dilute to 50 ml with methanol, mix well. Transfer 5 ml, accurately measured, to a 25 ml volumetric flask, dilute to volume with the dissolution medium as the reference solution. Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with aminopropyl bonded silica gel and a mixture of acetonitrile-0.15% sodium laurylsulfate solution (dissolve 3.0 g sodium laurylsulfate and 8 g sodium hydroxide with water and dilute to 2000 ml, add 20 ml of phosphoric acid, adjust the pH to 2.5) (30 : 70) as the mobile phase. Detection wavelength is 254 nm. Inject separately 10 µl of above two solutions, and record the chromatogram, calculate the dissolution of $\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_3$ from each tablet by the external standard method, not less than 75% of the labeled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. Transfer an accurately weighed quantity of the powdered tablets, equivalent to about 50 mg mebendazole to a 100 ml volumetric flask. Add 5 ml of formic acid, warm in a water bath (60°C) for 15 minutes. Cool, dilute with isopropanol to volume, mix well. Filter, discard the initial filtrate. Transfer 2 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with isopropanol to volume, mix well. Measure the absorbance of the resulting solution at 312 nm (Appendix IV A), calculate the content of $\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_3$, taking 495 as the value of A (1%, 1 cm).

Category As described under Mebendazole.

Strength (1) 0.1g (2) 0.2 g

Storage Preserve in tightly closed containers.

Compound Mebendazole Tablets

Compound Mebendazole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amounts of Mebendazole ($C_{16}H_{13}N_3O_3$) and Levamisole Hydrochloride ($C_{11}H_{12}N_2S \cdot HCl$).

Formula	Mebendazole	100 g
	Levamisole hydrochloride	25 g
	Excipient	a quantity

To make 1000 tablets

Description Pink tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.15 g of levamisole hydrochloride add 50 ml of water, shake thoroughly and filter. Add 2 ml of sodium hydroxide TS to 20 ml of the filtrate, boil for 10 minutes and cool, add a few drops of sodium nitroprusside TS; a red colour is produced, which fades on standing.

(2) To a quantity of the powdered tablets equivalent to about 20 mg of mebendazole add 2 ml of formic acid, shake thoroughly. Add 18 ml of acetone, mix well and filter [solution (1)]. Dissolve about 20 mg of mebendazole CRS in 2 ml of formic acid, add 18 ml of acetone, mix well [solution (2)]. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-formic acid (90 : 5 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry and examine under ultraviolet light (254 nm). The principal spot in the chromatogram obtained with solution (1) is identical in position to that obtained with solution (2).

(3) The filtrate obtained under Identification (1) yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Levamisole Hydrochloride Weigh accurately and powder finely 40 tablets. Transfer an accurately weighed quantity of the powdered tablets equivalent to about 0.4 g of levamisole hydrochloride to a 250 ml conical flask with stopper. Add 100 ml of water, shake for 25 minutes and filter. Discard the initial filtrate, transfer 50 ml of the successive filtrate, accurately measured, to a separator, add 5 ml of sodium hydroxide TS and mix well. Extract with 50 ml of chloroform, accurately measured, allow to stand, separate the chloroform layer and filter with a dry filter paper. Add 15 ml of glacial acetic acid and 1 drop of crystal violet IS to 25 ml of successive filtrate. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.08 mg of $C_{11}H_{12}N_2S \cdot HCl$.

Mebendazole Transfer an accurately weighed quantity of the powdered tablets equivalent to about 50 mg of mebendazole to a 100 ml volumetric flask. Add 5 ml of 98% formic acid, warm on a water bath for 15 minutes. Cool, dilute with isopropanol to volume and mix well. Filter, discard the initial filtrate, transfer 2 ml of the successive filtrate, accurately, measured, to another 100 ml volumetric flask, dilute with isopropanol to volume, mix well. Measure the absorbance of the resulting solution at 312 nm (Appendix IV A), calculate the content of $C_{16}H_{13}N_3O_3$, taking 495 as the value of A (1%, 1 cm).

Category Anthelmintic.

Storage Preserve in tightly closed containers.

Meclofenoxate Hydrochloride

$C_{12}H_{16}ClNO_3 \cdot HCl$ 294.18

[3685-84-5]

Meclofenoxate Hydrochloride is 2-(dimethylamino) ethyl *p*-chlorophenoxy acetate hydrochloride. It contains not less than 98.5% of $C_{12}H_{16}ClNO_3 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odour slightly characteristic; taste, sour and bitter.

Very soluble in water; freely soluble in ether; soluble in chloroform.

Melting range 137-142°C (Appendix VI C).

Identification (1) To about 10 mg, add 1 ml of acetic anhydride saturated with citric acid and heat gently; a deep purple colour is produced gradually.

(2) Dissolve about 10 mg in 1 ml of water, add several drops of bromine TS; A pale yellow precipitate or opalescence is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of meclofenoxate Hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 3.5-4.5 (Appendix VI H).

Clarity of solution Dissolve 1.0 g in 10 ml of water, the solution is clear (used for injection).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% (used for oral) or 0.5% (used for injection) (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g with 23 ml of water, add 2 ml of actate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Sterility Complies with the test for sterility (Appendix XI H). To each portion add water to produce a solution of about 25 mg per ml (used for injection).

Assay Dissolve about 0.2 g, accurately weighed, in 15 ml of glacial acetic acid, add 5 ml of mercury actate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.42 mg of $C_{12}H_{16}ClNO_3 \cdot HCl$.

Category Cerebral stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Meclofenoxate Hydrochloride Capsules
(2) Meclofenoxate Hydrochloride for Injection

Meclofenoxate Hydrochloride Capsules

Meclofenoxate Hydrochloride Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of meclofenoxate hydrochloride ($C_{12}H_{16}ClNO_3 \cdot HCl$).

Identification (1) A quantity of the contents complies with the test (1) for Identification described under Meclofenoxate Hydrochloride.

(2) To a quantity of the content equivalent to about 20 mg of meclofenoxate hydrochloride add 20 ml of water, shake and filter. The filtrate complies with the tests (2) and (4) for Identification described under Meclofenoxate Hydrochloride.

(3) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of meclofenoxate hydrochloride CRS.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.02 mol/L sodium heptanesulfonate solution-methanol (37 : 63) as the mobile phase previously adjusted to pH 2.0 with phosphoric acid. Detection wavelength is 225 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of meclofenoxate hydrochloride.

Procedure Transfer an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 50 mg of meclofenoxate hydrochloride to a 50 ml volumetric flask, add a quantity of dehydrated ethanol to dissolve meclofenoxate hydrochloride, mix well and filter. Measure accurately 5 ml of successive filtrate in a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Inject 20 μ l of the solution into the column within 2 hours and record the chromatogram. Dissolve a quantity of meclofenoxate hydrochloride, accurately weighed, in dehydrated ethanol and dilute to produce a solution of 0.1 mg per ml. Repeat the operation, using the resulting solution instead of the substance being examined, calculate the content of $C_{12}H_{16}ClNO_3 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Meclofenoxate hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Meclofenoxate Hydrochloride for Injection

Meclofenoxate Hydrochloride for Injection is a sterile powder or crystalline powder of meclofenoxate hydrochloride. Each container contains not less than 93.0% and not more than 107.0% of the labelled amount of Meclofenoxate Hydrochloride ($C_{12}H_{16}ClNO_3 \cdot HCl$), calculated with reference to the average weight of contents.

Description white crystals or a crystalline powder; odour slightly; taste, sour and bitter.

Identification Complies with the tests (1), (2) and (4) for Identification described under Meclofenoxate Hydrochloride.

Clarity of solution Dissolve the contents in each container with 5 ml of water, the solution is clear. Any opalescent produced is not more pronounced than that of reference suspension I (Appendix IX B).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Sterility Complies with the test for sterility described under Meclofenoxate Hydrochloride.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately about 0.2 g, carry out the Assay described under Meclofenoxate Hydrochloride. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.42 mg of $C_{12}H_{16}ClNO_3 \cdot HCl$.

Category As described under Meclofenoxate Hydrochloride.

Strength (1) 0.06 g (2) 0.1 g (3) 0.25 g

Storage Preserve in well closed containers, protected from light.

Meclozine Hydrochloride

$C_{25}H_{27}ClN_2 \cdot 2HCl$ 463.88 [1104-22-9]

Meclozine Hydrochloride is (R, S)-1-(4-chlorobenzhydryl)-4-(3-methylbenzyl) piperazine dihydrochloride. It contains not less than 97.0% of $C_{25}H_{27}ClN_2 \cdot 2HCl$, calculated on the dried basis.

Description A pale yellow to yellow crystalline powder; odour, slightly characteristic; tasteless. Freely soluble in chloroform; soluble in ethanol; very slightly soluble in water; practically insoluble in ether.

Specific absorbance Measure the absorbance of a solution of 15 μ g per ml in 0.1 mol/L hydrochloric acid solution at 232 nm (Appendix IV A), the value of A (1%, 1 cm) is 345-380.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of meclozine hydrochloride CRS (Appendix XVI).

(2) The ethanolic solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of ethanol solution A solution of 0.20 g in 10 ml of ethanol is clear and colourless; any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-toluene-methanol-concentrated ammonia solution (60 : 30 : 5 : 0.5) as the mobile phase. Apply separately to the plate 10 μ l each

of two solutions of the substance being examined in a mixture of equal volumes of dichloromethane and methanol containing (1) 50 mg per ml, (2) 0.25 mg per ml. After developing and removal of the plate, dry in air and spray with dilute potassium iodobismuthate TS. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Water Not more than 5.0% (Appendix VIII M, method 1).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 50 ml of chloroform, add 50 ml of glacial acetic acid, 5 ml of acetic anhydride and 10 ml of mercuric acetate TS. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.19 mg of $C_{25}H_{27}ClN_2 \cdot 2HCl$.

Category Antihistaminic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Meclozine Hydrochloride Tablets

Meclozine Hydrochloride Tablets

Meclozine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of meclozine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$).

Description Pale yellow tablets with colouring agent.

Identification Triturate and extract 15 tablets with chloroform for 3 times, filter, evaporate the filtrate on a water bath to dryness, dry the residue at 105°C for 1 hour and use it for the tests (1) and (2).

(1) Dissolve about 0.2 g in 25 ml of ethanol, filter. To the filtrate add 25 ml of a saturated solution of trinitrophenol in ethanol, stir and filter, wash the precipitate with several portions of ethanol and followed by water, dry it at 105°C for 4 hours. The melting range of the precipitate is 213–219°C, with decomposition (Appendix VI C).

(2) Dissolve a quantity of the powdered tablets equivalent to about 20 mg of meclozine hydrochloride in ethanol to produce a solution of about 0.01 mg per ml, filter. The light absorption of the filtrate exhibits a maximum at 230 nm (Appendix IV A).

(3) Dissolve about 25 mg in water and the solution yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 0.2 g of meclozine hydrochloride to a separator, add 50 ml of water, shake thoroughly, and then extract with chloroform for 3 times (50, 20 and 20 ml). Evaporate the combined chloroform extracts on a water bath to 10–15 ml, allow to cool. Add 15 ml of glacial acetic acid, 5 ml of acetic anhydride, 5 ml of mercuric acetate TS and 2 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the red colour disappears. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.19 mg of $C_{25}H_{27}ClN_2 \cdot 2HCl$.

Category As described under Meclozine Hydrochloride.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Medicinal Charcoal

Description A black powder; odourless; tasteless; free from grittiness.

Acidity or alkalinity Boil 2.5 g in 50 ml of water for 5 minutes, cool and filter, wash the residue with water. Combine the filtrate and washings to produce 50 ml. The solution is clear and neutral to litmus paper.

Chloride Dilute 10 ml of the filtrate obtained in the test for acidity or alkalinity with water to produce 200 ml, mix well. Carry out the limit test for chloride (Appendix VII A), using 20 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.10%).

Sulfate Carry out the limit test for sulfate (Appendix VII B), using 20 ml of the filtrate obtained in the test for acidity or alkalinity. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

Uncarbonized substances Boil 0.25 g in 10 ml of sodium hydroxide TS, filter. Any colour produced is not more intense than that of a reference solution prepared by mixing 0.3 ml of standard cobaltous chloride CS with 0.2 ml of standard potassium dichromate CS and 9.5 ml of water.

Acid-soluble substances Boil 1.0 g in 20 ml of water and 5 ml of hydrochloric acid for 5 minutes and filter. Wash the residue with 10 ml of hot water, combine the filtrate and the washings. Add 1 ml of sulfuric acid to the solution, evaporate to dryness and ignite the residue to constant weight; not more than 10 mg.

Loss on drying When dried to constant weight at 120°C, loses not more than 10.0% of its weight (Appendix VII L).

Residue on ignition Moisten about 0.5 g with 2–3 drops of ethanol. Carry out the test for residue on ignition (Appendix VIII N); not more than 3.0%.

Iron Boil 1.0 g in 25 ml of 1 mol/L hydrochloric acid VS for 5 minutes, cool and filter. Wash the residue with 30 ml of hot water in portions, combine the filtrate and the washings, add a quantity of water to produce 100 ml and mix well. Measure accurately 5 ml to a 50 ml Nessler cylinder, carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 2.5 ml of iron standard solution (0.05%).

Zinc Boil 1.0 g in 25 ml of water for 5 minutes, cool and filter. Wash the residue with 30 ml of hot water in portions, combine the filtrate and washings, add a quantity of water to produce 100 ml and mix well. Measure accurately 10 ml, add 0.5 g of ascorbic acid. Complete the test described under Primidone, beginning at the words "transfer to a 50 ml Nessler cylinder..." (0.02%).

Heavy metals Boil 1.0 g in 10 ml of dilute hydrochloric acid and 5 ml of bromine TS for 5 minutes and filter. Wash the residue with 35 ml of hot water, combine the filtrate and washing, add a quantity of water to produce 50 ml and mix well. To 20 ml add 1 drop of phenolphthalein IS and add ammonia TS dropwise until the solution becomes pink, then add 2 ml of acetate BS (pH 3.5) and a quantity of water to

produce 25 ml, add 0.5 g of ascorbic acid. Carry out the limit test for heavy metals (Appendix VIII H, method 1), compare the colour of the solution with that of the reference solution immediately after 5 minutes; not more than 0.003%.

Adsorptive power (1) To 1.0 g, dried to constant weight previously, add 100 ml of 0.12% quinine sulfate solution, shake vigorously for 5 minutes at a temperature not lower than 20°C. Filter through a dry medium rate filter paper immediately and discard the initial filtrate. To 10 ml of the successive filtrate add 1 drop of hydrochloric acid and 5 drops of potassium mercuric iodide TS; no opalescence is produced.

(2) Transfer 50 ml of 0.1% methylene blue solution, accurately measured, to each of two 100 ml cylinders with stoppers. To one cylinder add 0.25 g of the substance being examined (dried to constant weight previously), stopper, shake vigorously for 5 minutes at a temperature not lower than 20°C. Filter the two solutions through dry medium rate filter papers separately and discard the initial filtrates. Transfer 25 ml each of the successive filtrates, accurately measured, to two 250 ml volumetric flasks, add to each flask 50 ml of 10% sodium acetate solution and mix well. Add accurately 35 ml of iodine (0.1 mol/L) VS while swirling, stopper the flask, mix well and allow to stand with vigorous shake every 10 minutes. Dilute with water to volume after 50 minutes, mix well and allow to stand for 10 minutes. Filter through dry filter papers separately, discard the initial filtrates. Measure accurately 100 ml each of the successive filtrates and titrate with sodium thiosulfate (0.1 mol/L) VS separately. The difference between the volumes of iodine (0.1 mol/L) VS consumed is not less than 1.2 ml.

Category Adsorbent.

Storage Preserve in tightly closed containers.

Medroxyprogesterone Acetate

$C_{24}H_{34}O_4$ 386.53

[71-58-9]

Medroxyprogesterone Acetate is 17-(acetyloxy)-6 α -methyl-pregn-4-ene-3,20-dione. It contains not less than 97.0% and not more than 103.0% of $C_{24}H_{34}O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Very soluble in chloroform; soluble in acetone; sparingly soluble in ethyl acetate; slightly soluble in dehydrated ethanol; insoluble in water.

Melting range 202-208°C (Appendix VI C).

Specific optical rotation +53° to +59°, in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve 5 mg in 5 ml of sulfuric acid in a test tube, add slowly along the wall of the test tube 5 ml of ethanol; a bluish-violet colour is produced at the interface of the two layers.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the

reference solution in the chromatogram obtained in Assay.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of medroxyprogesterone acetate (Appendix XVI).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, in methanol to produce a solution of about 0.8 mg per ml as the test solution (1). Measure accurately 1 ml of solution (1) into a 50 ml volumetric flask and dilute with methanol to volume, mix well as the reference solution (2). Inject 10 μ l of solution (2) into the column, adjust the attenuation so that the peak height of principal peak in the chromatogram is about 25% of full scale of the chart. Inject separately accurately 10 μ l each of the solution (1) and (2) into the column and record the chromatogram for 1.5 times the retention time of the principal peak. No more than four secondary peaks in the chromatogram obtained with solution (1), each secondary peak and the sum of the areas of all secondary peak are not greater than 1/2 and 3/4 of the area of the principal peak of solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), with an octadecylsilane bonded silica gel column, using methanol-water (70 : 30) as the mobile phase and the wavelength of the detector is 254 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of Medroxyprogesterone Acetate. The resolution factor between the peaks of medroxyprogesterone acetate and internal standard is not less than 3.0%, the resolution factor of the secondary peak closed to medroxyprogesterone acetate and medroxyprogesterone acetate complies with the related requirements.

Internal Standard Solution Dissolve a quantity of norethisterone, accurately weighed, in methanol to produce a solution of about 0.8 mg per ml.

Procedure Dissolve a quantity of medroxyprogesterone acetate CRS, accurately weighed, in methanol to produce a solution of about 0.8 mg per ml. Transfer 2 ml each of the test solution and the internal standard solution, both measured accurately, in a 10 ml volumetric flask, dilute with methanol to volume, mix well. Inject 10 μ l of the resulting solution into the column. Repeat the operation, using the substance being examined instead of medroxyprogesterone acetate CRS, calculate the content of $C_{24}H_{34}O_4$.

Category Progestoid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Medroxyprogesterone Acetate Tablets

Medroxyprogesterone Acetate Tablets

Medroxyprogesterone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$).

Description White tablets.

Identification (1) Dissolve an amount of the finely powdered tablets equivalent to 60 mg of medroxyprogesterone acetate in 30 ml of chloroform with stirring, filter, evaporate the filtrate to dryness on a water bath, the residue complies with tests (1) for Identification described under Medroxyprogesterone

Acetate.

(2) Extract a quantity of the finely powdered tablet equivalent to 10 mg of medroxyprogesterone acetate with 20 ml of chloroform and filter, use the filtrate as test preparation. Prepare a solution containing 5 mg of medroxyprogesterone acetate CRS in 1 ml chloroform as reference preparation. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and chloroform-ethyl acetate (10 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, allow it to dry in air, heat at 120°C for half an hour, cool, spray with sulfuric acid-dehydrated ethanol (1 : 1), heat at 120°C for 10 minutes, cool, examine under ultraviolet light at 365 nm. The principal spots in the chromatogram obtained with the two solutions are identical in colour and position.

Content uniformity Comply with the requirements (Appendix X E).

Triturate 1 tablet with dehydrated ethanol in a mortar and transfer with the same solvent in several portions into a 100 ml volumetric flask. Gently heat for 15 minutes with shake, cool, dilute with dehydrated ethanol to volume, shake thoroughly, filter, discard the initial filtrate, dilute an accurately measured quantity of the successive filtrate with dehydrated ethanol to produce a solution of about 8 μ g per ml. Determine the content of medroxyprogesterone acetate as described under Assay.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets (for strength 10 mg), 15 tablets (for strength 4 mg) or 25 tablets (for strength 2 mg). To an amount of the powder equivalent to 20 mg of medroxyprogesterone acetate, accurately weighed, in a 100 ml volumetric flask add 60 ml of dehydrated ethanol and shake for 15 minutes, add dehydrated ethanol to volume and mix well. Filter, discard the initial filtrate, transfer 5 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 240 nm (Appendix IV A), calculate the content of $C_{24}H_{34}O_4$, taking 408 as the value of A (1%, 1 cm).

Category As described under Medroxyprogesterone acetate.

Strength (1) 2 mg (2) 4 mg (3) 10 mg (4) 250 mg

Storage Preserve in tightly closed containers, protected from light.

Mefenamic Acid

$C_{15}H_{15}NO_2$ 241.29

[61-68-7]

Mefenamic Acid is *N*-(2,3-dimethylphenyl) amino]-benzoic acid. It contains $C_{15}H_{15}NO_2$ not less than 99.0%, calculated on the dried basis.

Description A white or almost white fine crystalline powder; odourless.

Sparingly soluble in ether; slightly soluble in ethanol or chloroform; insoluble in water.

Identification (1) Dissolve about 25 mg in 15 ml of chloroform, examine under an ultraviolet light at 254 nm; exhibits a strong green fluorescence.

(2) Dissolve about 5 mg in 2 ml of sulfuric acid, add 0.05 ml of 0.5% potassium dichromate solution; a deep blue colour is produced, the colour fades immediately to brownish-green.

(3) The light absorption of a solution of 20 μ g per ml in a mixture of 1 mol/L hydrochloric acid and methanol (1 : 99), exhibits two maxima at 279 nm and 350 nm; the absorbance is about 0.69-0.74 and 0.56-0.60, respectively (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of mefenamic acid (Appendix XVI).

Copper Moisten 1.0 g with sulfuric acid in a silica crucible. Ignite until all the carbon is burned off and dissolve the residue in 0.1 mol/L nitric acid solution. Transfer it into 25 ml volumetric flask, dilute with the same solution to the volume, mix well, as the test solution. Transfer 1.0 ml of standard copper solution [Weigh accurately 0.393 g of copper sulfate to a 1000 ml volumetric flask, dissolve in 0.1 mol/L nitric acid solution and dilute to the volume, mix well. Measure accurately 10 ml into a 100 ml volumetric flask, add 0.1 mol/L nitric acid to volume, mix well], accurately measured, to 25 ml volumetric flask, dilute with 0.1 mol/L nitric acid to the volume, mix well, as the reference solution. Carry out the method for atomic absorption spectrophotometry (Appendix IV D test for impurities), measure the absorbance of the solutions at 324.8 nm, complies with the requirement. The absorbance of the test solution is not more than the absorbance obtained in reference solution (0.001%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L ammonium dihydrogen phosphate solution (adjust with ammonia TS to pH 5.0)-acetonitrile-tetrahydrofuran (40 : 46 : 14) as the mobile phase. Detection wavelength is at 254 nm, and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of mefenamic acid. Dissolve a quantity in the mobile phase to produce the test solution of 1 mg per ml. Measure accurately a quantity of the test solution and dilute with the mobile phase to produce the reference solution of 5 μ g per ml. Inject 10 μ l of the reference solution into the column, accurately measured, adjust the attenuation so that the principal peak height in the chromatogram is 15% of the full scale of the chart. Inject separately 10 μ l each of the test and reference solution, both accurately measured, into the column and record the chromatogram for 2.5 times the retention time of the principal peak. The single peak area due to impurities is not greater than 20% of the principal peak area of the reference solution. The sum of peak areas due to impurities is not greater than twice the principal peak area of the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.5 g accurately weighed, in 100 ml of warm dehydrated neutral ethanol (neutral to phenolsulfonphthalein IS) by shaking, add 3 drops of phenolsulfonphthalein IS, titrate with sodium hydroxide

(0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 24.13 mg of $C_{15}H_{15}NO_2$.

Category Antipyretic and analgesic non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Mefenamic Acid Capsules
(2) Mefenamic Acid Tablets

Mefenamic Acid Capsules

Mefenamic Acid Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of mefenamic acid ($C_{15}H_{15}NO_2$).

Identification (1) The powdered contents of capsules comply with the tests (1) and (2) for Identification described under Mefenamic acid.

(2) Dissolve a quantity of the powdered contents of capsules, equivalent to 0.25 g mefenamic acid in a mixture of 10 ml of 0.1 mol/L hydrochloric acid solution-methanol (1 : 99), shake and filter. To a quantity of the successive filtrate, dilute with above mixed solution to produce a solution of 20 μ g per ml. The light absorption of the solution exhibits maxima at 279 nm and 350 nm (Appendix IV A).

Dissolution Carry out the method for dissolution test (Appendix X C, method 2), using 40 ml of ethanol and adding phosphate BS (pH 8.0) to 800 ml as the dissolution medium, adjust the rotation speed at 75 rpm. Withdraw a quantity of the solution exactly after 45 minutes, filter. Measure accurately 3 ml of the successive filtrate to a 100 ml volumetric flask, dilute with phosphate BS (pH 8.0) to volume, mix well; then dissolve about 20 mg of mefenamic acid CRS in 5 ml of ethanol, dilute with phosphate BS (pH 8.0) appropriately to produce a solution of 10 μ g per ml. Measure the absorbances of two solutions at 286 nm (Appendix IV A) and calculate the dissolution of ($C_{15}H_{15}NO_2$) in each capsule. The dissolution of each capsule is not less than 50% of the labelled amount.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed powdered contents obtained in test for weight variation of contents equivalent to about 0.5 g of mefenamic acid, carry out the Assay as described under Mefenamic Acid, beginning at the words "add 100 ml of anhydrous neutral ethanol. Shake to dissolve". Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 24.13 mg of $C_{15}H_{15}NO_2$.

Category As described under Mefenamic Acid.

Strength 0.25 g

Storage Preserve in tightly closed containers, stored in a dry place.

Mefenamic Acid Tablets

Mefenamic Acid Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of mefenamic acid ($C_{15}H_{15}NO_2$).

Description White or almost white tablets.

Identification (1) Dissolve a quantity of powdered tablets

equivalent to about 25 mg of mefenamic acid in 15 ml of chloroform on shake, it complies with the test (1) for Identification described under Mefenamic Acid.

(2) Dissolve a quantity of powdered Tablets equivalent to about 5 mg of mefenamic acid in 2 ml of sulfuric acid, it complies with the test (2) for Identification described under Mefenamic Acid.

(3) Dissolve a quantity of powdered tablets equivalent to 0.25 g of mefenamic acid in 10 ml of a mixture of 1 mol/L hydrochloric acid solution-methanol (1 : 99) on shake, filter. Measure a quantity of the successive filtrate, dilute with a solvent mixture described above to produce a solution of 20 μ g per ml. The light absorption of the solution exhibits two maxima at 279 nm and 350 nm, respectively (Appendix IV A).

Dissolution Comply with the dissolution test (Appendix X C method 2), using 40 ml of ethanol and adding phosphate BS (pH 8.0) to 800 ml as the dissolution medium. Adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution exactly after 45 minutes, filter, measure accurately 3 ml of the successive filtrate to a 100 ml volumetric flask, dilute with phosphate BS (pH 8.0) to volume, mix well. Dissolve 20 mg of mefenamic acid CRS, accurately weighed with 5 ml of ethanol in a 100 ml volumetric flask, dilute with phosphate BS (pH 8.0) to volume, mix well. Measure accurately a quantity, dilute with phosphate BS (pH 8.0) to produce a solution of 10 μ g per ml. Measure the absorbances of the two solutions at 286 nm (Appendix IV A), calculate the dissolution of $C_{15}H_{15}NO_2$ from each tablet, not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity, equivalent to about 0.5 g of mefenamic acid, carry out the Assay as described under Mefenamic Acid, beginning at the words "add 100 ml of warm dehydrated neutral ethanol (neutral to phenolsulfonphthalein IS), shake to dissolve". Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 24.13 mg of $C_{15}H_{15}NO_2$.

Category As described under Mefenamic Acid.

Strength 0.25 g

Storage Preserve in tightly closed containers, stored in a dry place.

Megestrol Acetate

$C_{24}H_{32}O_4$ 384.52

[595-33-5]

Megestrol Acetate is 17 α -hydroxy-6-methylpregna-4,6-diene-3,20-dione-17-acetate. It contains not less than 97.0% and not more than 103.0% of $C_{24}H_{32}O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in acetone or ethyl acetate; sparingly soluble in ethanol; slightly soluble in ether; insoluble in water.

Melting range 213-220°C (Appendix VI C).

Specific optical rotation +9° to +12° in a solution of about 50 mg per ml in chloroform (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of megestrol acetate (Appendix XVI).

Light absorption The light absorption of the solution obtained in the Assay (Appendix IV A), exhibits a maximum at 287 nm only, the ratio of absorbance at 240 nm to that at 287 nm is not more than 0.17.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, in absolute ethanol to produce a solution of about 2 mg per ml as the test solution (1). Measure accurately 1 ml of solution (1) into a 50 ml volumetric flask and dilute with absolute ethanol to volume, mix well as the reference solution (2). Inject 10 µl of solution (2) into the column, adjust the attenuation so that the peak height of principal peak in the chromatogram is about 25% of full scale of the chart. Inject separately accurately 10 µl each of the solution (1) and (2) into the column and record the chromatogram for twice the retention time of the principal peak. No more than four secondary peaks in the chromatogram obtained with solution (1), each secondary peak and the sum of the areas of all secondary peak are not greater than 1/2 and 3/4 of the area of the principal peak of solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 288 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of megestrol acetate.

Procedure Dissolve about 20 mg of the substance being examined, weighed accurately, in methanol into a 100 ml volumetric flask and dilute with methanol to volume, mix well. Measure accurately 2 ml of the above solution into a 10 ml volumetric flask and dilute with methanol to volume, mix well as the test solution (1). Inject 10 µl of solution (1) into the column and record the chromatogram. Repeat the operation using megestrol acetate CRS instead of the substance being examined, calculate the content of $C_{24}H_{32}O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Progesteroïd.

Storage Preserve in tightly closed containers, protected from light.

Preparation Megestrol Acetate Tablets

Megestrol Acetate Tablets

Megestrol Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled

amount of megestrol acetate ($C_{24}H_{32}O_4$).

Description Sugar coated or film coated tablets with white or almost white core.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Related substances Add absolute ethanol to a quantity of fine powdered tablets, shake well and dilute to prepare a solution of 2 mg per ml. Filter, use the successive filtrate as solution (1), and dilute it with absolute ethanol to produce a solution containing 0.04 mg per ml as solution (2). Carry out the test as described under Megestrol Acetate, the individual secondary peak area in the chromatogram of solution (1) and the sum of peak areas is not greater than 1/2 and 3/4 of the principal peak area in that of solution (2), respectively.

Content uniformity Comply with the requirements (Appendix X E). Take 1 tablet into a 50 ml (for strength 1 mg) or 200 ml (for strength 4 mg) volumetric flask, add 2 ml of water to make the tablet disintegrate, then add quantities of methanol, ultrasonic to make megestrol acetate dissolved and dilute with methanol to volume, shake well and centrifugate, take the supernate as the test solution. Carry out the method as described under Assay, calculate the content of $C_{24}H_{32}O_4$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 200 ml of 0.8% lauryl sodium sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm, Withdraw a quantity of the solution after exactly 60 minutes and filter. Take the successive filtrate (for strength 1 mg) or measure accurately 5 ml of the successive filtrate into a 20 ml volumetric flask and dilute with the dissolution medium to volume, mix well (for strength 4 mg) as the test solution. Dissolve about 25 mg of megestrol acetate CRS, weighed accurately, in methanol into a 50 ml volumetric flask and dilute with methanol to volume, mix well. Measure a quantity of the solution and dilute with 1% lauryl sodium sulfate solution to produce a solution of about 5 µg per ml as the reference solution. Carry out the method as described under Assay. Inject separately 20 µl of the test solution and the reference solution and record the chromatogram. Calculate the dissolution of $C_{24}H_{32}O_4$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 75% of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 1 mg of megestrol acetate, to a 50 ml volumetric flask, add a quantity of methanol and ultrasonic to make megestrol acetate dissolved, then dilute with methanol to volume, mix well and centrifugate, take the supernate as the test solution. Dissolve a quantity of megestrol acetate CRS, accurately weighed, in methanol to produce a solution of about 20 µg per ml as the reference solution. Carry out the method in Assay as described under Megestrol Acetate, calculate the content of $C_{24}H_{32}O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Megestrol Acetate.

Strength (1) 1 mg (2) 4 mg

Storage Preserve in tightly closed containers, protected from light.

Meglumine

$C_7H_{17}NO_5$ 195.22

[6284-40-8]

Meglumine is 1-deoxy-1-(methylamino)-D-glucitol. It contains not less than 99.0% of $C_7H_{17}NO_5$, calculated on the dried basis.

Description A white crystalline powder; almost odourless; taste, slightly sweet salty and astringent. Freely soluble in water; sparingly soluble in ethanol, practically insoluble in chloroform.

Melting point 128-132°C (Appendix VI C).

Specific optical rotation -15.5° to -17.5° , measured at 25°C, in a solution of about 0.10 g per ml in water (Appendix VI E).

Identification (1) To about 20 mg in a clean test tube add 2 ml of water and 1 ml of ammoniacal silver nitrate TS, shake thoroughly, and heat in a water bath; silver mirror is deposited on the inner wall of the tube.

(2) To 10 mg add 1 ml of ferric chloride TS and 2 ml of 20% sodium hydroxide solution dropwise; a brownish-red precipitate is produced and subsequently dissolved to form a brownish-red solution.

(3) Dissolve 50 mg in 1 ml of saturated aqueous solution of carbon disulfide, add a few drops of 4% nickel sulfate solution; a yellowish-green colour is produced with yellowish-green precipitate.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of meglumine (Appendix XVI).

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and colourless.

Readily carbonizable substance Carry out the limit test for readily carbonizable substances (Appendix VIII O) using 0.25 g; any colour produced is not more intense than that of a reference solution OR_2 .

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Nickel Ignite 1.0 g, to the residue add 0.5 ml of nitric acid, evaporate to remove nitrous oxide completely. Allow to cool, add 2 ml of hydrochloric acid, and evaporate to dryness on a water bath. Dissolve the residue in 5 ml of water and transfer to a Nessler cylinder, add 1 drop of bromine TS, shake for 1 minute, then make alkaline with ammonia TS, add 1 ml of dimethylglyoxime TS, mix well and allow to stand for 5 minutes. Any colour produced is not more intense than that of a reference solution using 5 ml of nickel sulfate standard solution (dissolve a quantity of hydrated nickel sulfate in water to produce a solution of 1.0 μ g Ni per ml), proceed as directed above, beginning at the words "add 1 drop of bromine TS...", (0.0005%).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.001%.

Pyrogens Complies with the test for pyrogens (Appendix

XI D), using 600 mg per kg of the rabbit's weight dissolved in 5 ml of Water for Injection.

Assay Dissolve 0.4 g, accurately weighed, in 20 ml of water, add 2 drops of methyl red IS, titrate with hydrochloric acid (0.1 mol/L) VS. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 19.52 mg of $C_7H_{17}NO_5$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Meglumine Adipiodone Injection
(2) Meglumine Diatrizoate Injection

Meglumine Adipiodone Injection

Meglumine Adipiodone Injection is a sterile solution of Adipiodone and Meglumine in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of meglumine adipiodone ($C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{17}NO_5$).

Description A clear, white or pale yellow to yellow liquid.

Identification (1) Evaporate about 1 ml to dryness and heat gently, purple iodine vapour is evolved.

(2) To 0.1 ml add 1 ml of ferric chloride TS and add dropwise 2 ml of 20% sodium hydroxide solution, a brownish-red precipitate is formed, which dissolves subsequently to produce a brownish-red solution.

(3) Complies with test (3) for Identification described under Meglumine Diatrizoate Injection, using adipiodone CRS instead of diatrizoic acid CRS.

pH value 6.5-8.0 (Appendix VI H).

Colour The injection with a strength of 20 ml : 10 g is not more intensely coloured than reference solution Y_8 ; with a strength of 1 ml : 0.3 g or 20 ml : 6 g is not more intensely coloured than reference solution Y_6 (Appendix IX A, method 1).

Free iodine To a quantity equivalent to about 1 g of meglumine adipiodone add water to produce 10 ml, carry out the test for Free iodine described under Diatrizoic Acid, the result complies with the requirement.

Iodide Dilute a quantity equivalent to about 0.8 g of adipiodone meglumine with water to produce 10 ml, add dropwise 3 ml of dilute nitric acid, stir for a few minutes to form a precipitate, filter and wash the residue with 5 ml of water. Filter the combined filtrate and washings. Add 1 ml of chloroform and 1 ml of concentrate hydrogen peroxide solution, shake and allow to separate. The chloroform layer is not more intensely coloured than a reference solution prepared similarly using 6 ml of 0.0013% potassium iodide solution (equivalent to 10 μ g of I per ml).

Pyrogens Complies with test for pyrogens (Appendix XI D), using 3 ml per kg of the rabbit's weight, inject slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To a quantity equivalent to about 5 g, accurately measured, of meglumine adipiodone in a 100 ml volumetric flask add water to volume and mix well. Measure accurately 10 ml of the solution, carry out the Assay described under Diatrizoic Acid, beginning at the words "add 30 ml of sodium hydroxide TS...". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 25.50 mg of $C_{20}H_{14}I_6N_2O_6 \cdot 2C_7H_{17}NO_5$.

Category Diagnostic agent.

Strength (1) 1 ml : 0.3 g (2) 20 ml : 6 g
(3) 20 ml : 10 g

Storage Preserve in well closed containers, protected from light.

Meglumine Diatrizoate Injection

Meglumine Diatrizoate Injection is a sterile solution of Diatrizoic acid and Meglumine (1 : 1) in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of meglumine diatrizoate ($C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$).

Description A clear, colourless to pale yellow liquid.

Identification (1) Evaporate about 1 ml to dryness, heat the residue gently; violet iodine vapor is evolved.

(2) To about 0.1 ml add 1 ml of ferric chloride TS and add dropwise 2 ml of 20% sodium hydroxide solution; a brownish-red precipitate is produced which dissolves immediately to form a brownish-red solution.

(3) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of *n*-butanol-glacial acetic acid-water (4 : 1 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of (1) an aqueous dilution of the injection equivalent to 3 mg of meglumine diatrizoate per ml; (2) a 2 mg per ml solution of diatrizoic acid CRS in water containing 0.04% of sodium hydroxide. After developing and removal of the plate, examine under an ultraviolet light at 254 nm. The principal spots obtained with the two solutions are identical in position.

pH value 6.0-7.6 (Appendix VI H).

Colour Not more intense than reference solution Y₆ (Appendix IX A, method 1).

Free iodine To a quantity equivalent to 1.0 g of meglumine diatrizoate add water to produce 10 ml, the resulting solution complies with the test for Free iodine described under Diatrizoic Acid.

Iodide Complies with the test for Iodide described under Sodium Diatrizoate Injection, using a quantity equivalent to 1.0 g of meglumine diatrizoate.

Pyrogens Complies with the test for pyrogens (Appendix XI D), inject 3 ml per kg of the rabbit's weight slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately a quantity equivalent to about 6 g of meglumine diatrizoate to a 100 ml volumetric flask, add water to volume, mix well. Measure accurately 10 ml, carry out the Assay described under Diatrizoic Acid, beginning at the words "add 30 ml of sodium hydroxide TS and 1.0 g of powdered zinc...". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 26.97 mg of $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$.

Category Diagnostic agent.

Strength (1) 1 ml : 0.3 g (2) 20 ml : 12 g
(3) 20 ml : 15.2 g (4) 50 ml : 32.5 g
(5) 100 ml : 60 g (6) 100 ml : 65 g
(7) 200 ml : 130 g

Storage Preserve in well closed containers, protected from light.

Compound Meglumine Diatrizoate Injection

Compound Meglumine Diatrizoate Injection is a sterile solution of 1 part of sodium diatrizoate and 6.6 parts of Meglumine Diatrizoate containing suitable amount of sodium hydroxide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled total amount of sodium diatrizoate ($C_{11}H_9I_3N_2NaO_4$) and meglumine diatrizoate ($C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$).

Description A colourless or pale yellow, clear liquid.

Identification (1) Evaporate 1 ml to dryness, heat gently, a violet vapour of iodine is produced on decomposition.

(2) To 0.1 ml add 1 ml of ferric chloride TS and 2 ml of 20% sodium hydroxide solution, a brownish-red precipitate is produced, which is dissolved to form a brownish-red solution.

(3) Dissolve a quantity in water to make a solution of 2 mg of sodium diatrizoate and meglumine diatrizoate per ml. Dissolve 20 mg of diatrizoic acid CRS in 10 ml of 0.04% sodium hydroxide solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of *n*-butanol-glacial acetic acid-water (4 : 1 : 5) as the mobile phase. Apply separately to the plate 10 μ l of each of the above two solutions. After developing and removal of the plate, examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds in position to the principal spot in the chromatogram obtained with the reference solution.

pH value 6.0-7.6 (Appendix VI H).

Colour Not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Free iodine Shake a quantity equivalent to 1.0 g of sodium diatrizoate and meglumine diatrizoate with 1 g of potassium iodide in 10 ml of water. Add a few drops of starch IS to the solution and shake well, no blue colour is produced immediately.

Iodide Dilute a quantity equivalent to 1.0 g of sodium diatrizoate and meglumine diatrizoate with water to 10 ml. Add dilute nitric acid dropwise until the precipitation is complete and then add 3 ml of dilute nitric acid in excess. Stir and filter, wash the precipitate with 5 ml of water. Combine the filtrate and the washings, add 1 ml of concentrated hydrogen peroxide solution and 1 ml of chloroform, mix well. Allow to stand until separation takes place, any colour produced in chloroform layer is not more intense than that of a reference solution prepared in the same manner, using 4.0 ml of 0.0013% potassium iodide solution (equivalent to 10 μ g of I per ml).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 3 ml per kg of the rabbit's weight and inject slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Place a quantity equivalent to about 5 g of sodium diatrizoate and meglumine diatrizoate in 100 ml volumetric flask. Carry out the Assay described under Diatrizoic Acid, Beginning at the word "Add 30 ml of sodium hydroxide TS and 1.0 g of zinc powder". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 26.04 mg of sodium diatrizoate

and meglumine diatrizoate.

Category Diagnostic agent.

Strength (1) 1 ml : 0.3 g (2) 20 ml : 12 g
(3) 20 ml : 15.2 g

Storage Preserve in well closed containers, protected from light.

Meleumycin

Meleumycin is a mixture mainly containing Midecamycin A₁ and Kitasamycin A₆. It contains not less than 35% of Midecamycin A₁. It has a potency of not less than 850 Meleumycin Units per mg, calculated on the dried basis.

Description A white or almost yellow powder or crystalline powder; slightly bitter, taste. Very soluble in methanol, free soluble in ethanol, acetone, ethyl acetate or chloroform; very slightly soluble in water; insoluble in petroleum ether.

Identification (1) The retention times of the two principal peaks of meleumycin in the substance being examined in the chromatogram obtained in the test for Midecamycin A₁ components are identical with those of the two principal peaks of meleumycin CRS in the chromatogram of the reference solution.

(2) The light absorption of a solution of 16 µg per ml in absolute ethanol solution exhibits a maximum at 232 nm (Appendix IV A).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.5% (Appendix VII N).

Midecamycin A₁ components Carry out the method for high performance liquid chromatography (Appendix VD), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.2 mol/L ammonium formate (adjust to pH 7.3 with triethylamine)-acetonitrile (62 : 38) as the mobile phase. The Column temperature is about 30°C. Detection wavelength is 232 nm. Dissolve an accurately weighed quantity in mobile phase to produce a solution containing 3 mg Midecamycin CRS per ml. Inject 10 µl of the successive filtrate into the column and record the chromatogram. Detection wavelength is 254 nm. The resolution factor between Midecamycin A₁ and the adjacent peaks is more than 1.5.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a solution of 2 mg per ml, mix well and filter. Inject 10 µl of the successive filtrate into the column and record the chromatogram. Repeat the operation, using meleumycin CRS instead of the substance being examined, calculate the content of midecamycin A₁ (C₄₁H₆₇NO₁₅).

Assay Dissolve an accurately weighed quantity in ethanol (using 1 ml of ethanol for 4 mg of the substance being examined), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A). 1000 Meleumycin Units are equivalent to 1 mg of Meleumycin.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Meleumycin Tablet

Meleumycin Tablets

Meleumycin Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of meleumycin. It contains not less than 35% of Midecamycin A₁, calculated on the labeled amount.

Description Sugar coated or film coated tablets with white or almost white core.

Identification Dissolve a quantity of powdered and coating-removed tablets in ethanol and filter. The successive filtrate complies with the test for Identification described under Meleumycin.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (24 ml of dilute hydrochloric acid solution → 1000 ml) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exact 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same solvent to produce a solution of 16 µg per ml. Triturate 10 tablets, weigh an accurately weighed quantity equivalent to about the average weight of one tablet, dilute with the dissolution medium to produce a solution of 16 µg per ml and filter. Measure the absorbance of the resulting solutions at 232 nm (Appendix IV A), calculate the dissolution of meleumycin from each tablet. Not less than 80% is dissolved.

Midecamycin A₁ Weigh accurately and triturate 10 tablets, weigh a quantity of powdered tablets equivalent to 20 mg of meleumycin in 10 ml volumetric flasks, dilute with mobile phase, mix well and filter. Inject 10 µl of the successive filtrate and carry out the test for Midecamycin A₁ described under Meleumycin.

Other requirements Comply with the general requirements for tablets (Appendix I A)

Assay Weigh accurately and triturate 10 tablets, dissolve quantity of powdered tablets equivalent to 0.1 g of meleumycin in 25 ml of ethanol (triturate 5 tablets for the sugar coated tablets in 125 ml of ethanol) in portions to dissolve meleumycin, dilute with sterile water to produce a solution of 1000 Units per ml, mix well and allow to stand. carry out the Assay described under Meleumycin (Appendix VI A). 1000 Meleumycin Units are equivalent to 1 mg of Meleumycin.

Category As described under Meleumycin.

Strength 0.1 g (100000 units)

Storage Preserve in tightly closed containers, stored in a dry place.

Meloxicam

C₁₄H₁₃N₃O₄S₂ 351.42

Meloxicam is 4-hydroxy-2-methyl-N-(5-methyl-

1,3-thiazol-2-yl)-2H-1,2-benzothiazine-3-carboxamide-1,1-dioxide. It contains not less than 98.5% of $C_{14}H_{13}N_3O_4S_2$, calculated on the dried basis.

Description A slightly yellow to pale yellow, or slightly yellowish green to pale yellowish green crystalline powder, odourless; tasteless.

Soluble in dimethylformamide; slightly soluble in acetone; very slightly soluble in methanol or ethanol; practically insoluble in water.

Identification (1) Ignite about 30 mg in a test tube, the vapour produced turns moistened lead acetate TP to black.

(2) Dissolve 10 mg in 5 ml of chloroform, add 1 drop of Ferric chloride TS, shake and allow to stand, a pale violet red colour is produced in the chloroform layer.

(3) The light absorption of a solution of 7 μ g per ml in 0.1 mol/L sodium hydroxide solution exhibits maxima at 270 nm and 362 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of meloxicam (Appendix XXIII).

Related substances Carry out the method for performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L ammonium acetate solution-methanol (1 : 1) as the mobile phase. The detection wavelength is 270 nm. The number of the theoretical plate of the column is not less than 2000, calculated with reference to the peak of meloxicam. Dissolve a quantity in mobile phase to produce a solution of 1 mg per ml as test solution. Dilute an accurately measured volume of the test solution with mobile phase to produce a solution of 10 μ g per ml as reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% full scale of the chart. Inject each 20 μ l of the test solution and the reference solution into the column respectively, and record the chromatogram for twice the retention time of the principal peak. The sum of the secondary peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Chloride Spread 2 g of anhydrous sodium carbonate on the bottom and the wall of a crucible, place 1.0 g of the substance being examined upon the anhydrous sodium carbonate, moisten with a few quantity of water, after dryness, ignite gently until thoroughly incinerated. Dissolve the cooled residue in a quantity of water, filter. Wash the crucible with water and filter, combine the filtrate and washings, dilute to 20 ml with water, mix well. To 1 ml of the filtrate add nitric acid dropwise to make the solution neutral, then add 1 drop of nitric acid, mix well, heat at 75-85°C on a water bath until hydrogen sulfide fumes are no longer evolved, cool, neutralize with 1% sodium carbonate solution, dilute to 25 ml with water. Carry out the limit test for chloride (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.1%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Mix 1.0 g with 1 g of calcium hydroxide, dropwise 2 ml of water and mix well. After dryness, heat gently until it is thoroughly charred, then ignite at 500-600°C until the incineration is completed. Dissolve the cooled residue in a

mixture of 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.4 g, accurately weighed, in 100 ml of neutralized ethanol (neutral to bromothymol blue IS) and 25 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured. Add 3 drops of bromothymol blue IS, titrate with hydrochloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 35.14 mg of $C_{14}H_{13}N_3O_4S_2$.

Category Antipyretic and analgesic non-steroid anti-inflammatory drug.

Storage Preserve in tightly closed containers, protected from light.

Menadiol Diacetate

$C_{15}H_{14}O_4$ 258.27

Menadiol Diacetate is 2-methyl-1,4-naphthalenediol diacetate. It contains not less than 99.0% of $C_{15}H_{14}O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or with a faint acetic acid odour.

Freely soluble in boiling ethanol; slightly soluble in ethanol; practically insoluble in water.

Melting point 112-115°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 0.003%, calculated on the dried basis, in dehydrated ethanol at 285 nm (Appendix IV A), the value of A (1%, 1 cm) is 230-260.

Identification (1) Heat gently 50 mg with 5 ml of 0.1 mol/L sodium hydroxide solution for a few minutes, cool, add a few drops of hydrogen peroxide solution, neutralize with dilute hydrochloric acid. Filter, wash the precipitate with water and allow to dry. Dissolve 0.5 mg of the residue in 5 ml of ethanol, add 2 ml of concentrated ammonia TS and a few drops of ethyl cyanoacetate, a bluish-violet colour is produced; add 5 ml of 20% sodium hydroxide solution, a brownish-yellow colour is produced; add acid or expose to light, the bluish-violet colour disappears.

(2) The light absorption of the solution obtained in Specific absorbance exhibits two maxima at 285 nm and 322 nm (Appendix IV A).

(3) The infrared absorption (Appendix IV C) is concordant with the reference spectrum of menadiol diacetate (Appendix XVI).

Loss on drying When dried to constant weight at 80°C, loses not more than 1.0% of its weight (Appendix VIII L).

Zinc Heat 1.0 g with 10 ml of dilute hydrochloric acid, filter, wash the residue with a quantity of hot water. Combine the filtrate and the washings, add water to produce 50 ml, add 1 ml of 5% potassium ferrocyanide solution.

Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner, using 0.20 mg of zinc sulfate in place of the substance being examined.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay To about 0.2 g, accurately weighed, add 15 ml of glacial acetic acid and 15 ml of dilute hydrochloric acid and heat under reflux for 15 minutes. Allow to cool, protected from oxidation, add 0.1 ml of *o*-phenanthroline IS, titrate with ceric sulfate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 12.92 mg of $C_{15}H_{14}O_4$.

Category Vitamin.

Storage Preserve in tightly closed container, protected from light.

Preparation Menadiol Diacetate Tablets

Menadiol Diacetate Tablets

Menadiol Diacetate Tablets contain not less than 92.5% and not more than 107.5% of the labeled amount of menadiol diacetate ($C_{15}H_{14}O_4$).

Description Sugar coated tablets with white to pale yellow core.

Identification (1) The light absorption of the solution obtained in Assay exhibits two maxima at 285 nm and 322 nm (Appendix IV A).

(2) To a quantity of the powdered tablets equivalent to about 50 mg of menadiol diacetate, add a quantity of ethanol, boil and filter. Evaporate the filtrate to dryness on a water bath, add 5 ml of sodium hydroxide solution (4→1000), heat gently for a few minutes, cool, add a few drops of hydrogen peroxide solution, neutralize with dilute hydrochloric acid. Filter, wash the precipitate with water and allow to dry. Dissolve about 0.5 mg of the residue with 5 ml of ethanol, add 2 ml of concentrated ammonia TS and a few drops of ethyl cyanoacetate, a bluish-violet colour is produced; add 5 ml of 20% sodium hydroxide solution, a brownish-yellow colour is produced; add acid or on exposure to light, the bluish-violet colour disappears.

(3) The filtrate obtained under test (2) for Identification yields the reactions characteristic of diacetates (Appendix III).

Content uniformity Comply with the requirements (Appendix X E).

Triturate 1 tablet moisten with 5 drops of absolute ethanol with a quantity of absolute ethanol, transfer to a 250 ml (for strength 5 mg) or 200 ml (for strength 4 mg) or 100 ml (for strength 2 mg) volumetric flask with 40 ml of absolute ethanol in divided portions, shake thoroughly to dissolve menadiol diacetate, dilute with dehydrated ethanol to volume and mix well, filter. Measure the absorbance of the successive filtrate at 285 nm (Appendix IV A). Dissolve about 40 mg of menadiol diacetate CRS, accurately weighed, in absolute ethanol, dilute with absolute ethanol to produce a solution of 0.02 mg per ml. Measure the absorbance in the same manner, calculate the content of $C_{15}H_{14}O_4$ in each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 40 tablets with coating removed. To an accurately weighed quantity of the powder, equivalent to about 20 mg of menadiol acetate, in a 100 ml volumetric flask add a quantity of absolute ethanol and shake

to dissolve menadiol acetate, dilute to volume and mix well. Filter, measure accurately 10 ml of the successive filtrate to another 100 ml volumetric flask, dilute with absolute ethanol to volume and mix well. Measure the absorbance of the resulting solution at 285 nm (Appendix IV A); dissolve about 20 mg of menadiol diacetate CRS, accurately weighed, in absolute ethanol, and dilute to produce a solution of 0.02 mg per ml. Measure the absorbance in the same manner. Calculate the content of $C_{15}H_{14}O_4$.

Category As described under Menadiol Diacetate.

Strength (1) 2 mg (2) 4 mg (3) 5 mg

Storage Preserve in tightly closed containers, protected from light.

Menadione Sodium Bisulfite

$C_{11}H_9NaO_5S \cdot 3H_2O$ 330.30

[6147-37-1]

Menadione Sodium Bisulfite is a mixture of menadione sodium bisulfite and sodium bisulfite. It contains not less than 63.0% and not more than 75.0% of $C_{11}H_9NaO_5S \cdot 3H_2O$; and not less than 30.0% and not more than 38.0% of $NaHSO_3$, calculated on the dried basis.

Description A white crystalline powder; odourless or slightly characteristic; hygroscopic; decomposed easily on exposure to light.

Freely soluble in water; practically insoluble in ethanol, ether or benzol.

Identification (1) Dissolve about 50 mg in 5 ml of water, add dropwise 0.1 mol/L sodium hydroxide solution, a freshly yellow precipitate of menadione sodium bisulfite is produced.

(2) Dissolve about 80 mg in 2 ml of water, add a few drops of dilute hydrochloric acid, warm, the sulfur dioxide odour is perceptible.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with reference spectrum of menadione sodium bisulfite (Appendix XVI).

Sulfonic acid menadione sodium bisulfite Dissolve 0.1 g in 5 ml of water, add 2 drops of ortho-phenanthroline TS, no precipitate is produced.

Water 9.0%-13.0% (Appendix VIII M, method 1 A).

Assay Sodium bisulfite Dissolve about 1.5 g, accurately weighed, in a 100 ml volumetric flask, in water and shake, dilute to volume and mix well. Accurately measure 15 ml to a conical flask with stopper, add accurately 25 ml of iodine (0.05 mol/L) VS, stopper and mix well, allow to stand for 5 minutes. Add slowly 1 ml of hydrochloric acid, titrate with sodium thiosulfate (0.1 mol/L) VS, add 3 ml of starch IS towards the end of the titration, continue the titration until blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 5.203 mg of $NaHSO_3$.

Menadione sodium bisulfite Protect from light in the procedure.

Reference solution To 50 mg of menadione CRS, accurately weighed, in a 250 ml volumetric flask, add chloroform to volume and shake thoroughly. Measure accurately 2 ml of the solution to a 100 ml volumetric flask, dilute with dehydrated ethanol to volume, mix well.

Test solution Dissolve about 1.0 g, accurately weighed, in a 200 ml volumetric flask, in water and dilute to volume, mix well. Measure accurately 20 ml to a separator, add 40 ml of chloroform and 5 ml of sodium carbonate TS, shake vigorously for 30 seconds. Allow to stand, separate the chloroform layer and filter through the cotton moistened by chloroform. Transfer the filtrate to a 200 ml volumetric flask, wash the filter with 40 ml of chloroform immediately, combine the washings in the same volumetric flask. Extract twice the water layer with 20 ml each of chloroform, filter the extracts, wash the filter with 20 ml of chloroform. Combine the extracts and washings to the volumetric flask, add chloroform to volume and mix well. Measure accurately 2 ml in another 100 ml volumetric flask, dilute with absolute ethanol to volume, mix well.

Procedure Measure the absorbances of the solutions at 250 nm and make necessary correction using 2% chloroform absolute ethanol solution (Appendix IV A). Calculate the content of $C_{11}H_9NaO_5S \cdot 3H_2O$, multiply the result by 1.918.

Category Vitamin.

Storage Preserve in tightly closed containers, protected from light.

Preparation Menadione Sodium Bisulfite Injection

Menadione Sodium Bisulfite Injection

Menadione Sodium Bisulfite Injection is a sterile solution of Menadione Sodium Bisulfite in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of menadione sodium bisulfite ($C_{11}H_9NaO_5S \cdot 3H_2O$).

Description A clear, colourless liquid; decomposes easily on exposure to light.

Identification Complies with test (1) and (2) for Identification described under Menadione Sodium Bisulfite, using a quantity of the injection.

pH value 2.0-4.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protect from light in the procedure. Weigh accurately a quantity equivalent to about 20 mg of menadione to a separator. Add 40 ml of chloroform and 2.5 ml of sodium carbonate TS, shake vigorously for 30 seconds, allow to stand, separate the chloroform layers and filter with the cotton moistened by chloroform. Transfer the filtrate into a 100 ml volumetric flask, wash the filter with 20 ml of chloroform immediately, combine the washing in the same volumetric flask. Extract the water layer with 10 ml each of chloroform twice, filter the extracts, wash the filter with 20 ml of chloroform. Combine the extracts and washing to the volumetric flask, add chloroform to volume and mix well. Measure accurately 2 ml in another 100 ml volumetric flask, dilute with absolute ethanol to volume, mix well. Measure the absorbances of the solutions at 250 nm and make any necessary correction using 2% chloroform absolute ethanol solution as blank (Appendix IV A). Weigh accurately about

20 mg of menadione CRS in a 100 ml volumetric flask add chloroform to volume and shake thoroughly. Measure accurately 2 ml of the solution to a 100 ml volumetric flask, dilute with absolute ethanol to volume, mix well. Calculate the content of $C_{11}H_9NaO_5S \cdot 3H_2O$ (multiply the result by 1.918).

Category As described under Menadione Sodium Bisulfite.

Strength (1) 1 ml : 2 mg (2) 1 ml : 4 mg

Storage Preserve in tightly closed containers, protected from light.

Menotropins

Menotropins is gonads-stimulating hormone obtained from the urine of postmenopausal women, mainly containing follicle-stimulating hormone (FSH) and luteinising hormone (LH). It contains not less than 40 Units of follicle-stimulating hormone activity per mg. The ratio of Units of LH activity to Units of FSH activity is approximately 1.

The manufacturing process must have been shown to reduce any viral contamination such as hepatitis virus or HIV by appropriate validated methods.

Description An almost white or pale yellow powder. Soluble in water.

Identification The results of the Assay indicates the ovaries of immature female rats increase and the weight of the seminal vesicles and prostate gland of immature male rats also increase.

Loss on drying When dried in vacuum over phosphorous pentoxide for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Undue toxicity Complies with the test for undue toxicity (Appendix XI C), using a solution of 100 Units of FSH activity per ml in Sodium Chloride Injection, injected intravenously.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 1 EU per units of menotropins.

Assay FSH Carry out the method for biological assay of FSH (Appendix XIII M), the result is not less than 80% and not more than 125% of the labelled potency.

LH Carry out the method for biological assay of LH (Appendix XIII N), the result is not less than 80% and not more than 125% of the labelled potency.

Category Gonads-stimulant.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Menotropins for Injection

Menotropins for Injection

Menotropins for Injection is a sterile, lyophilized mixture of menotropins and suitable excipients. It has a potency of not less than 76% and not more than 135% of the labelled potency of follicle-stimulating hormone (FSH) and luteotropic

hormone (LH).

Description A white, or almost white lyophilized mass or powder.

Identification The result of the assay indicates the ovaries of the immature female rats increase, and vesicula seminalis and prostate of the immature male rats gain weight.

Acidity or alkalinity Dissolve the content each of 3 vials in 3 ml of water respectively, combine the solutions, pH 6.0–8.0 (Appendix VI H).

Sterility Complies with the test for sterility (Appendix XI H), dissolving the content of each container in 2 ml of sterile water.

Loss on drying, Undue toxicity, Bacterial endotoxin Complies with the corresponding test described under Menotropins.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Menotropins.

Category As described under Menotropins.

Strength (1) 75 Units (2) 150 Units

Storage Preserve in well closed containers, stored in a cool place, protected from light.

Mercaptopurine

$C_5H_4N_4S \cdot H_2O$ 170.19

[50-44-2]

Mercaptopurine is 6-mercaptopurine monohydrate. It contains not less than 97.0% and not more than 103.0% of $C_5H_4N_4S$, calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, slightly sweet. Very slightly soluble in water or ethanol, practically insoluble in ether.

Identification (1) To about 20 mg add 20 ml of ethanol, warm to dissolve. Add 1 ml of 1% ethanolic lead acetate solution; a yellow precipitate is produced.

(2) To 20 mg add a few drops of nitric acid, evaporate to dryness on a water bath. The residue is yellow in colour. Cool and add 1–2 drops of sodium hydroxide TS; the colour changes to yellowish-brown.

(3) Dissolve 10 mg in 10 ml of ammonia TS, a clear solution is produced; add 1 ml of silver nitrate TS, a white, curdy precipitate is produced; the precipitate is not dissolved on heating with nitric acid.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mercaptopurine (Appendix XVI).

Sulfate Shake 0.25 g with 25 ml of water for 5 minutes, filter. To the filtrate add 1 ml of dilute hydrochloric acid, 2 ml of barium chloride TS and mix, no opalescence is produced.

6-Hydroxypurine Carry out the method for spectrophotometry (Appendix IV A), using the solution obtained in the Assay,

the ratio of the absorbance at 255 nm to that at 325 nm is not greater than 0.06.

Loss on drying When dried to constant weight at $140^\circ C$, loses not more than 11.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.001%.

Assay Dissolve an accurately weighed quantity in hydrochloric acid solution (9→1000) to produce a solution of 5 μg per ml, measure the absorbance at 325 nm (Appendix IV A). Calculate the content of $C_5H_4N_4S$, taking 1265 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Mercaptopurine Tablets

Mercaptopurine Tablets

Mercaptopurine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of mercaptopurine ($C_5H_4N_4S \cdot H_2O$).

Description Pale yellow tablets.

Identification (1) To a quantity of finely powdered tablets equivalent to about 30 mg of mercaptopurine add 30 ml of ethanol, heat on a water bath to dissolve mercaptopurine, cool and filter. The filtrate complies with the tests (1) and (2) for Identification described under Mercaptopurine.

(2) Extract a quantity of finely powdered tablets equivalent to about 10 mg of mercaptopurine with 10 ml of ammonia TS and filter. The filtrate complies with the test (3) for Identification described under Mercaptopurine.

Dissolution Carry out dissolution test (Appendix X C, method 2), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute a quantity of successive filtrate with hydrochloric acid solution (9→1000) to produce a solution of 5 μg per ml. Measure the absorbance of the resulting solution at 325 nm (Appendix IV A). Calculate the dissolution of $C_5H_4N_4S \cdot H_2O$ from each tablet, taking 1131 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve a portion of the powder, equivalent to about 50 mg of mercaptopurine, in a 100 ml volumetric flask with 50 ml of hydrochloric acid solution (9→1000) by heating in a water bath. Cool and dilute with hydrochloric acid solution (9→100) to volume, mix and filter. Dilute an accurately measured portion of the successive filtrate with hydrochloric acid solution (9→100) to produce a solution of 5 μg per ml, measure the absorbance at 325 nm (Appendix IV A). Calculate the content of $C_5H_4N_4S \cdot H_2O$, taking 1131 as the value of A (1%, 1 cm).

Category As described under Mercaptopurine.

Strength (1) 25 mg (2) 50 mg (3) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Meropenem

$C_{17}H_{25}N_3O_5S \cdot 3H_2O$ 437.51

Meropenem is trihydrate (–)-(4R,5S,6S)-3-[(3S,5S)-5-(Dimethylamino) Carbonyl-3-pyrrolidiny] thio-6-[(1R)-1-hydroxyethyl]-4-methyl-7-oxo-1-azabicyclo[3,2,0]hept-2-ene-2-carboxylic acid. It contains not less than 92.0% of $C_{16}H_{16}N_4O_8S$, calculated on the anhydrous basis.

Description A white to slightly yellow crystalline powder; odourless, bitter odor.

Soluble in methanol; sparingly soluble in water, insoluble in acetone, ethanol and ether, soluble in 0.1 mol/L sodium hydroxide, soluble in 0.1 mol/L hydrochloric acid.

Specific optical rotation -17° to -21° in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay. (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of meropenem (Appendix XVI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity An aqueous solution of 10 mg per ml, pH 4.0-6.0 (Appendix VI).

Clarity and colour of solution To each of 5 portions add suitable amount (the amount is 0.2 times of that of meropenem) sodium carbonate (for Injection) and water to produce solutions of 0.11 g per ml according to the labelled amount respectively, the solution are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₅ or YG₅ (Appendix IX A, method 1).

Related substance Dissolve an accurately weighed quantity in mobile phase solution to produce a solution of 5 mg per ml as test solution. Dissolve an accurately weighed quantity of meropenem CSR in mobile phase solution to produce a solution of 25 µg per ml as reference solution. Carry out the method for Assay. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject 20 µl of the test solution and the reference solution into the column and record the chromatograms for 3.5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principle peak is not greater than 1.5% of the area of the principle peak in the reference solution. The area of single peak is not more than 0.5% of the area of the principle peak in the reference solution.

Dichloromethane and Acetone Carry out the method for determination of residual solvents (Appendix VIII P), using a capillary column coated with 5% phenyl-95% methylpolysiloxane

(or with the similar polarity stationary phase). Maintaining the temperature at 50°C, use flame ionization detector (FID) with temperature at 250°C, the injector temperature is 140°C. The incubation temperature of headspace oven is 90°C, the incubation time of headspace vial is 20 minutes, the volume of injection is 1.0 ml. Dissolve 0.2 g, accurately weighed, in headspace vial, and a quantity of sodium carbonate equivalent to 20% weight of the substance being examined in 5 ml of water, accurately measured, well closed, as the test solution. Measure accurately a quantity of acetone and methylene chloride with water to produce a solution containing 0.2 mg of acetone and 24 µg of methylene chloride per ml, measure accurately 5 ml in headspace vial, tightly closed, as the reference solution.

Inject the reference solution, record the chromatogram. The order of elution of the peaks is acetone and methylene chloride, the resolution factor between the peaks is not less than 1.5.

Inject the test solution and the reference solution separately, record the chromatogram. Calculate the content of acetone and methylene chloride respectively with respect to the peak area obtained in the chromatogram by the external standard method, the result complies with the related requirements.

Water 11.4%-13.4% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition: not more than 0.001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.12 EU per mg of meropenem.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method), to each portion add 0.1 g of sterile sodium carbonate solution (dissolve anhydrous sodium carbonate in water and dilute to 100 ml) and not more than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.3% triethylamine solution [measure 3.0 ml of triethylamine in 900 ml water, adjust pH to 5.0 with phosphate acid solution (1 → 10), dilute with water to 1000 ml] -acetonitrile (100 : 7), detection wavelength is 220 nm. Measure a quantity of reference solution and heat the reference solution in a water bath for one hour. Inject 20 µl of the solution into the column, and record the chromatogram. The number of the theoretical plate of the column is not less than 3000, calculated with reference to the peak of meropenem. The resolution factor between the peak of meropenem and the open-cycle of meropenem complies with the related requirements. The order of the peaks in the chromatogram is meropenem and the open-cycle of meropenem.

Procedure Dissolve an accurately weighed quantity in mobile phase solution to produce a solution of 0.5 mg per ml as the test solution. Inject 20 µl of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of meropenem CSR in mobile phase solution as the reference solution and repeat the operation. Calculate the content of $C_{17}H_{25}N_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β-lactam antibiotic.

Storage Preserve in tightly closed containers in cool, dark and dry place.

Preparation Meropenem for Injection

Meropenem for Injection

Meropenem for Injection is a sterile mixture of meropenem and suitable amount of anhydrous sodium carbonate. Each container contains not less than 75.0% of meropenem ($C_{17}H_{25}N_3O_5S$), calculated on the anhydrous basis. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of meropenem ($C_{17}H_{25}N_3O_5S$), calculated with reference to the average weight of contents.

Description A white or slightly yellow powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of CRS.

(2) To a quantity add dilute acid, effervescence is produced with carbon dioxide, when which is passed into calcium hydroxide TS, a white precipitate is produced immediately.

Alkalinity An aqueous solution of 5 mg per ml, pH 7.0-8.5 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml according to the labelled amount respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₆ or YG₅ (Appendix IX A, method 1).

Loss on drying When dried to constant weight in vacuum over phosphorous pentoxide at 60°C, loses not less than 9.0% and not more than 12.0% (Appendix VIII L).

Related substances and bacterial endotoxin Comply with the corresponding requirements described under meropenem.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method), to each portion add not less than 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Comply with the general requirements for Injection (Appendix I B).

Assay Carry out the Assay described under Meropenem, using an accurately weighed quantity of the mixed contents obtained from the test for Weight variation of contents.

Category As described under Meropenem.

Strength Calculated as $C_{17}H_{25}N_3O_5S$
(1) 0.25 g (2) 0.5 g

Storage preserve in well closed containers in cool, dark and dry place.

Metacycline Hydrochloride

$C_{22}H_{22}N_2O_8 \cdot HCl$ 478.89

[3963-95-9]

Metacycline Hydrochloride is [4S-(4 α , 4a α , 5 α , 5a α , 12a α)]-6-methylene-4-(dimethylamino)-3,5,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacene carboxamide monohydrochloride. It contains not less than 87.0% of metacycline ($C_{22}H_{22}N_2O_8$), calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, bitter.

Sparingly soluble in water or methanol; insoluble in chloroform.

Identification (1) The light absorption of a solution of 10 μ g per ml in a mixture of hydrochloric acid (1 mol/L)-methanol (1:99) exhibits a maximum at 345 nm. The absorbance at 345 nm is 0.31 to 0.33 (Appendix IV A).

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of metacycline RS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of metacycline hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.1 g in 10 ml of water, pH 2.0-3.0 (Appendix VI H).

Light absorbing impurities The absorbance of a solution of 10 mg per ml in a mixture of hydrochloric acid (1 mol/L)-methanol (1:100) at 490 nm, is not greater than 0.20 (Appendix IV A).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.5% (Appendix VIII L), using 0.2 g to 0.3 g.

Residue on ignition Not more than 0.2% (Appendix VIII N).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in 0.01 mol/L hydrochloric acid solution to produce solutions of 0.2 mg per ml (solution 1) and 2 μ g per ml (solution 2). Inject 20 μ l of solution 2 into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. And then inject 20 μ l each of solution 1 and 2 into the column, and record the chromatogram for twice the retention time of the principal peak.

The peak area of oxytetracycline in the chromatogram of solution 1 is not more than the area of the principal peak of solution 2.

Assay Carry out the method for high performance liquid chromatogram (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L ammonium oxalate solution-dimethylformamide-0.2 mol/L diammonium hydrogen phosphate solution (65:27:7) adjusting pH to 7.6 ± 0.2 with phosphoric acid as the mobile phase. The flow rate is 1.0 ml per minute, and the temperature of the column is 35°C, detection wavelength is 280 nm. Dissolve a quantity of oxytetracycline RS and metacycline RS in 0.01 mol/L hydrochloric acid solution to produce a solution each of 0.08 mg per ml. Inject the above solution into the column. The resolution factor between the peaks of oxytetracycline and metacycline is greater than 4.0.

Procedure Dissolve 20 mg of the substance being examined, accurately weighed, with 0.01 mol/L hydrochloric acid solution in a 25 ml volumetric flask and dilute to volume, mix well. Transfer a portion of the solution into a 10 ml volumetric flask and dilute to volume with 0.01 mol/L hydrochloric acid solution, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using metacycline RS instead of the substance being

examined, calculate the content of $C_{22}H_{22}N_2O_8$.

Category Tetracycline antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Metacycline hydrochloride capsules
(2) Metacycline hydrochloride tablets

Metacycline Hydrochloride Capsules

Metacycline Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of metacycline ($C_{22}H_{22}N_2O_8$).

Identification The contents of capsules comply with the tests for Identification described under Metacycline hydrochloride tablets.

Related substances Dissolve a quantity of mixed contents obtained in the test for Weight variation, accurately weighed, in 0.01 mol/L hydrochloric acid solution to produce a solution of about 0.2 mg per ml, and filter. Use the successive filtrate as the solution 1. Dilute a quantity of solution 1, accurately measured, with 0.01 mol/L hydrochloric acid solution to produce a solution of 2 μ g per ml as solution 2. Carry out the method described under metacycline hydrochloride.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 60 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with water to 50 ml. Dissolve a quantity of metacycline hydrochloride CRS in water to produce a solution of about 10 μ g per ml. Measure the absorbances of the resulting solutions at 345 nm (Appendix IV A). Calculate the dissolution of $C_{22}H_{22}N_2O_8$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Loss on drying When dried to constant weight at 105°C, the contents of the capsules lose not more than 2.0% of their weights (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighted quantity (equivalent to about 80 mg of metacycline) of mixed contents obtained in the test for weight variation with 0.01 mol/L hydrochloric acid solution in a 100 ml volumetric flask and dilute to volume, mix well, filter. Transfer 5 ml of successive filtrate into a 50 ml of volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume. Inject 20 μ l of the resulting solution into the column, carry out the Assay as described under metacycline hydrochloride.

Category As described under Metacycline Hydrochloride.

Strength Calculated on $C_{22}H_{22}N_2O_8$ (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Metacycline Hydrochloride Tablets

Metacycline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of metacycline ($C_{22}H_{22}N_2O_8$).

Description Sugar coated or film coated with yellow or yellowish brown core.

Identification A quantity of powdered tablets with coating removed complies with tests (1), (2), and (4) for Identification described under Metacycline Hydrochloride.

Related substances Dissolve a quantity of powdered tablets in 0.01 mol/L hydrochloric acid solution to produce a solution of about 0.2 mg per ml, and filter. Use the successive filtrate as the solution 1. Dilute a quantity of solution 1, accurately measured, with 0.01 mol/L hydrochloric acid to produce a solution of 2 μ g per ml as solution 2. Carry out the method described under metacycline hydrochloride.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, the rotational speed of the paddle is adjusted to 60 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with water to 50 ml. Dissolve a quantity of metacycline hydrochloride CRS in water to produce a solution of about 10 μ g per ml. Measure the absorbance of the resulting solutions at 345 nm (Appendix IV A). Calculate the dissolution of $C_{22}H_{22}N_2O_8$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity (equivalent to about 80 mg of metacycline) in 0.01 mol/L hydrochloric acid solution in a 100 ml volumetric flask and dilute to volume, mix well, filter. Transfer 5 ml of successive filtrate into a 50 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume. Inject 20 μ l of the resulting solution into the column, carry out the Assay as described under metacycline hydrochloride.

Category As described under Metacycline Hydrochloride.

Strength 0.1 g calculated as $C_{22}H_{22}N_2O_8$.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Metamizole Sodium

$C_{13}H_{16}N_3NaO_4S \cdot H_2O$ 351.36

Metamizole Sodium is [(1, 5-dimethyl-2-phenyl-3-oxo-2,3-dihydro-1H-pyrazol-4-yl) methylamino] methanesulfonic acid sodium salt, monohydrate. It contains not less than 99.0% of $C_{13}H_{16}N_3NaO_4S$ (for parenteral administration) or 98.5% (for oral administration), calculated on the dried basis.

Description White (for parenteral administration) or slightly yellow (for oral administration) crystals or a crystalline powder; odourless; taste, slightly bitter. The aqueous solution turns gradually to yellow on standing. Freely soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Identification (1) Dissolve about 20 mg in 1 ml of dilute hydrochloric acid, add 2 drops of sodium hypochlorite TS, a

transient blue colour is produced, which turns to yellow on boiling.

(2) Dissolve about 0.2 g in 8 ml of dilute hydrochloric acid, the odour of sulfur dioxide is evolved on heating, then the odour of formaldehyde is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Metamizole Sodium (Appendix XVI).

(4) Yields the flame reaction of sodium salts (Appendix III)

Acidity Dissolve 0.50 g in 50 ml of water, pH 6.0-7.0 (Appendix VI H).

Clarity and colour of solution Dissolve 2.5 g (for parenteral administration) or 1.0 g (for oral administration) in 10 ml of water, when the bubbles disappear, examine immediately, the solution is clear and colourless. Any colour produced is not more intense than that of a reference solution (to 1.2 ml of standard potassium dichromate CS, 0.10 ml of standard copper sulfate CS and 0.10 ml of standard cobaltous chloride CS add water to 50 ml and mix well), compared immediately.

Clarity of methanol solution Shake 0.50 g with 10 ml of methanol to dissolve. Any opalescence produced is not more pronounced than that of the reference solution [to 0.50 ml of potassium sulfate standard solution, 1 ml of hydrochloric acid solution (1 mol/L) VS and 3 ml of freshly prepared barium chloride solution (1→20) add water to 10 ml, mix well and allow to stand for 10 minutes] (for parenteral administration).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 0.20 g. Any opalescence produced is not more pronounced than that of a reference solution, using 2.0 ml of potassium sulfate standard solution (0.1%).

4-N-nor Metamizole Sodium To 0.50 g in a 50 ml volumetric flask add water to dissolve and dilute to volume, mix well. Measure 1.0 ml to a 25 ml Nessler cylinder, add water to 10 ml, add 5 ml of hydrochloric acid solution (1→2), heat on a water bath for 5 minutes. Cool, add 7 ml of water, mix well, add 2.0 ml of 10% ethanolic solution of vanilin, add water to volume and mix well. Any colour produced is not more intense than that of reference solution prepared by mixing 1.0 ml of a solution containing 10 mg of metamizole sodium CRS with 2.0 ml (for parenteral administration) or 7.0 ml (for oral administration) of a solution containing 10 µg of anhydrous 4-N-nor metamizole sodium CRS per ml treated in similar manner (0.2% for parenteral administration or 0.7% for oral administration).

Loss on drying When dried to constant weight at 105°C, loses not more than 5.5% of its weight (Appendix VIII L).

Heavy metals Moisten 1.0 g in quartz crucible or hard glass evaporating dish with 1 ml of sulfuric acid, heat gently until white fumes are no longer evolved. Cool, add 0.5 ml of nitric acid, continue to ignite until nitrous oxide fumes are no longer evolved, then ignite at 500-600°C until the incineration is complete. Cool, add 2 ml of hydrochloric acid, evaporate to dryness on a water bath. Dissolve the residue in 15 ml of water, add ammonia TS dropwise until the solution is neutral to phenolphthalein IS, then add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001% (for parenteral administration) or 0.002% (for oral administration).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of ethanol and 10 ml of hydrochloric acid (0.01 mol/L) VS. Titrate immediately with iodine (0.05 mol/L) VS at a rate of 3-5 ml per minutes until a pale yellow colour persists for 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 16.67 mg of $C_{13}H_{16}N_3NaO_4S$.

Category Antipyretic and analgesic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Metamizole Sodium Drops
(2) Metamizole Sodium Injection
(3) Metamizole Sodium Nasal Drops
(4) Metamizole Sodium Tablets

Metamizole Sodium Drops

Metamizole Sodium drops contain not less than 95.0% and not more than 105.0% of the labelled amount of Metamizole Sodium ($C_{13}H_{16}N_3NaO_4S \cdot H_2O$).

Description A clear to slightly yellow liquid.

Identification Comply with tests (1) and (2) for Identification as described under Metamizole Sodium.

pH value 5.0-7.0 (Appendix VI H).

Colour Not more intense than the reference solution of Y₄ (Appendix IX A, method 1).

Other requirements Comply with the general requirements for oral solutions (Appendix I O).

Assay To 5 ml of Metamizole Sodium, accurately measured, add 40 ml of ethanol and dilute to 50 ml with water, mix well. Remove 10 ml of the resulting solution, accurately measured, to a conical flask and add 2 ml of ethanol, 6.5 ml of water and 0.5 ml of formaldehyde solution, stand for 1 minute. And then add 1 ml of hydrochloric acid solution (9→1000), mix well. Titrate with iodine (0.05 mol/L) VS (the titration speed is 3-5 ml per minute) until a pale yellow colour persists for 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 17.57 mg of $C_{13}H_{16}N_3NaO_4S \cdot H_2O$.

Category As described under Metamizole Sodium.

Strength 1 ml : 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Metamizole Sodium Injection

Metamizole Sodium Injection is a sterile solution of Metamizole Sodium in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of Metamizole Sodium ($C_{13}H_{16}N_3NaO_4S \cdot H_2O$).

Description A clear, colourless or slightly yellow liquid.

Identification Complies with tests (1) and (2) for Identification described under Metamizole Sodium.

Colour Not more intense than reference solution Y₃ (Appendix IX A, method 1).

pH value 5.0-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To 10 ml, accurately measured, in a 100 ml volumetric flask add 80 ml of ethanol, dilute with water to volume and mix well. To 10 ml, accurately measured, in a conical flask add 2 ml of ethanol, 6.5 ml of water and 0.5 ml

of formaldehyde solution, allow to stand for 1 minute, add 1.0 ml of hydrochloric acid solution (9 → 1000) and mix well. Titrate with iodine (0.05 mol/L) VS at a rate of 3-5 ml per minutes until a pale yellow colour persists for 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 17.57 mg of $C_{13}H_{16}N_3NaO_4S \cdot H_2O$.

Category As described under Metamizole Sodium.

Strength (1) 1 ml : 0.25 g (2) 2 ml : 0.5 g

Storage Preserve in well closed containers, protected from light.

Metamizole Sodium Nasal Drops

Metamizole Sodium Nasal Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of metamizole sodium ($C_{13}H_{16}NaO_4S \cdot H_2O$).

Description A clear, colourless to slightly yellow liquid.

Identification Comply with tests (1) and (2) for Identification as described under Metamizole Sodium.

p value 7.5 - 8.5 (open text)

Colour Not more intense than the reference solution of YG₄ (Appendix IX A, method 1).

Other requirements Comply with the general requirements for Nasal preparations (Appendix I R).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (dissolve 6.8 g of potassium dihydrogen phosphate with 1000 ml of water, adjust pH to 4.5 ± 0.5 with phosphoric acid) - methanol (7 : 3) as the mobile phase. Maintain the column at a temperature of 30°C. Detection wavelength is 265 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of metamizole sodium.

Procedure Dilute a quantity of the nasal drops, accurately measured, with a mixture of methanol-water (7 : 3) to produce a solution of 0.4 mg of metamizole sodium per ml. Inject 20 µl of the resulting solution into the column, record the chromatogram. Repeat the operation mentioned above, using metamizole sodium CRS instead of the nasal drops being examined, calculated the content of $C_{13}H_{16}NaO_4S \cdot H_2O$ with respect of the peak area obtained in the chromatogram by the external standard method.

Category As described under Metamizole Sodium.

Strength (1) 1 ml : 0.2 g (2) 3 ml : 0.6 g

Storage Preserve in tightly closed containers, protected from light.

Metamizole Sodium Tablets

Metamizole Sodium Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of Metamizole Sodium ($C_{13}H_{16}N_3NaO_4S \cdot H_2O$).

Description White or almost white tablets.

Identification Comply with tests (1) and (2) for Identification described under Metamizole Sodium.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Dissolve a quantity of the powder equivalent to about 0.3 g of Metamizole Sodium, accurately weighed, in 10 ml of ethanol and 10 ml of 0.01 mol/L hydrochloric acid solution, titrate immediately with iodine (0.05 mol/L) VS at a rate of 3-5 ml per minute until the colour persists for 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 17.57 mg of $C_{13}H_{16}N_3NaO_4S \cdot H_2O$.

Category As described under Metamizole Sodium.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Metaraminol Bitartrate

$C_9H_{13}NO_2 \cdot C_4H_6O_6$ 317.29

[33402-03-08]

Metaraminol Bitartrate is α -(1-aminoethyl)-3-hydroxy-[R-(R*, S*)]-benzenemethanol and [R-(R*, R*)]-2,3-dihydrobutane-dioate (1 : 1) salt. It contains not less than 98.5% of $C_9H_{13}NO_2 \cdot C_4H_6O_6$, calculated on the dried basis.

Description A white, crystalline powder; almost odourless. Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Melting range 171-176°C (Appendix VI C).

Identification (1) Mix about 5 mg with 2 ml of a saturated solution of ammonium molybdate in sulfuric acid, a blue colour is produced.

(2) Dissolve about 5 mg in 0.5 ml of water, add 2 drops of sodium nitroprusside TS, 2 drops of acetone and 0.2 g of sodium bicarbonate, heat at 60°C in a water bath for 1 minute, a reddish-purple colour is produced.

(3) The light absorption of a solution of 0.10 mg per ml in water exhibits a maximum at 272 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of metaraminol bitartrate (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of water, pH 3.2-3.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in an iodine flask in 40 ml of water. Add 40 ml of bromine (0.05 mol/L) VS, accurately measured, and 8 ml of hydrochloric acid, insert the stopper tightly and allow to stand for 15 minutes. Slightly remove the stopper, add quickly 8 ml of potassium iodide TS and insert the stopper immediately, shake. Rinse the stopper and the neck of the flask with a small amount of water, add 1 ml of chloroform and shake. Titrate with sodium thiosulfate (0.1 mol/L) VS, adding starch IS towards the end of the titration, until the blue colour

disappear. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 5.288 mg of $C_9H_{13}NO_2 \cdot C_4H_6O_8$.

Category α -Adrenergic receptor stimulant

Storage Preserve in tightly closed containers, protected from light.

Preparation Metaraminol Bitartrate Injection

Metaraminol Bitartrate Injection

Metaraminol Bitartrate Injection is a sterile solution of Metaraminol Bitartrate in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of metaraminol ($C_9H_{13}NO_2$).

Description A clear, colourless liquid.

Identification To 1 ml add 2 drops of sodium nitroprusside TS, 2 drops of acetone and 0.2 g of sodium bicarbonate, heat at 60°C in a water bath for 1 minutes, a reddish-purple colour is produced.

pH value 3.0-4.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To 5 ml equivalent to about 50 mg of metaraminol, accurately measured, in a 50 ml volumetric flask add water to volume and mix well. Measure accurately 5 ml of this solution to a 100 ml volumetric flask, add water to volume and mix well. Measure the absorbance at 272 nm (Appendix IV A). Calculate the content of $C_9H_{13}NO_2$, taking 111 as the value of A (1%, 1 cm).

Category As described under Metaraminol Bitartrate.

Strength (1) 1 ml : 10 mg of Metaraminol (equivalent to 19 mg of Metaraminol Bitartrate)
(2) 5 ml : 50 mg of Metaraminol (equivalent to 95 mg of Metaraminol Bitartrate)

Storage Preserve in well closed containers, protected from light.

Metformin Hydrochloride

$C_4H_{11}N_5 \cdot HCl$ 165.63

[1115-70-4]

Metformin Hydrochloride is 1, 1-dimethyl-biguanide hydrochloride. It contains not less than 98.5% of $C_4H_{11}N_5 \cdot HCl$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless. Freely soluble in water; soluble in methanol; slightly soluble in ethanol; insoluble in chloroform or ether.

Melting range 220-225°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of about 5 μ g per ml in water at 233 nm (Appendix IV A), the value of A (1%, 1 cm) is 778-818.

Identification (1) Dissolve 10 mg in 10 ml of water and add

10 ml of a mixture of 10% sodium nitroprusside solution-potassium ferrocyanide TS-10% sodium hydroxide solution (prepared by mixing equal volumes of each of the solutions and allowing to stand for 20 minutes). A red colour is produced within 3 minutes.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of metformin hydrochloride (Appendix XVI).

(3) The aqueous solution yields reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with sulfonic acid groups cation-exchange bonded silica gel and 1.7% ammonium dihydrogen phosphate (adjust the pH to 3.0 by phosphoric acid) as the mobile phase. Detection Wavelength is 218 nm. The number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of dicyandiamide and the resolution factor between the peaks of metformin hydrochloride and dicyandiamide should comply with the requirement. Dissolve a quantity of the substance being examined, weighed accurately, in mobile phase to produce a solution of about 0.5 mg per ml as the test solution (1). Dissolve a quantity of dicyandiamide CRS, weighed accurately, in water to produce a solution of about 0.1 mg per ml as the reference solution (2). Separately measure accurately 0.5 ml each of solution (1) and solution (2) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as the reference solution (3). Inject 20 μ l of solution (3) into the column, adjust the attenuation so that the peak height of dicyandiamide in the chromatogram is about 10% of full scale of the chart. Inject separately 10 μ l each of the solution (1) and (3) into the column and record the chromatogram for twice the retention time of the peak of metformin hydrochloride. If there is any peak corresponding to the peak of dicyandiamide in the chromatogram of solution (1), its content is no more than 0.02%. The area of any other secondary peak is not greater than 1/5 of the area of the peak of metformin hydrochloride in the chromatogram of solution (3), the sum of the areas of all secondary peaks is not greater than the area of the peak of metformin hydrochloride of solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 1.0 g: not more than 0.002%.

Assay Dissolve about 70 mg, accurately weighed, in 10 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 2 drops of naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 8.282 mg of $C_4H_{11}N_5 \cdot HCl$.

Category Hypoglycemic agent.

Storage Preserve in tightly closed containers.

Preparation Metformin Hydrochloride Tablets

Metformin Hydrochloride Tablets

Metformin Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the

labelled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Description Sugar or film coated tablets with white core.

Identification (1) To a quantity of powdered tablets, equivalent to about 50 mg of metformin hydrochloride, add 10 ml of water to dissolve metformin hydrochloride and filter, the filtrate complies with the tests (1) and (3) for Identification described under Metformin Hydrochloride. (2) The light absorption of the solution obtained in the Assay exhibits a maximum at 233 nm (Appendix IV A).

Dissolution Carry out dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Transfer 2 ml of the filtrate, accurately measured, to a 100 ml volumetric flask and dilute with water to volume. Measure the absorbance of the resulting solution at 233 nm (Appendix IV A). Calculate the dissolution of $C_4H_{11}N_5 \cdot HCl$ from each tablet, taking 798 as the value of A (1%, 1 cm); not less than 70% of the labelled amount is dissolved.

Related substances Carry out the method as described under Related substances in Metformin Hydrochloride. Transfer a quantity of the powdered tablet equivalent to about 50 mg of metformin hydrochloride, to a 100 ml volumetric flask, add a quantity of mobile phase and make metformin hydrochloride dissolved by ultrasonical treatment, dilute with mobile phase to volume, mix well and filter, take the successive filtrate as the test solution (1). Dissolve a quantity of dicyandiamide CRS, weighed accurately, in water to produce a solution of about 0.1 mg per ml as the reference solution (2). Separately measure accurately 0.5 ml each of solution (1) and solution (2) into a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as the reference solution (3). If there is any peak corresponding to the peak of dicyandiamide in the chromatogram of solution (1), its content is no more than 0.10%. The area of any other secondary peak is not greater than the area of the peak of metformin hydrochloride in the chromatogram of solution (3), the sum of the areas of all secondary peaks is not greater than three times of the area of the peak of metformin hydrochloride of solution (3).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powdered tablets, equivalent to about 10 mg of metformin hydrochloride, accurately weighed, in a 100 ml volumetric flask add 75 ml of water, shake thoroughly for 15 minutes to dissolve metformin hydrochloride, dilute with water to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 233 nm (Appendix IV A). Calculate the content of $C_4H_{11}N_5 \cdot HCl$, taking 798 as the value of A (1%, 1 cm).

Category As described under Metformin Hydrochloride.

Strength 0.25 g

Storage Preserve in tightly closed containers.

Methacrylic Acid Copolymer I

Methacrylic acid copolymer I is a copolymer of methyl methacrylate, ethyl acrylate and trimethyl

ammonium chloride ethyl methacrylate in a ratio of 60 : 30 : 10.

Description Slightly white, translucent or transparent solid with different shape and size. Soluble in boiling water or acetone; practically insoluble in isopropanol.

Refractive index Dissolve 1.25 g in 10 ml of isopropanol-acetone (6 : 4), the refractive index is 1.380-1.385 (Appendix VI F).

Viscosity Dissolve 6.0 g in 100 ml of 75% ethanol solution, the kinematic viscosity at 20°C is not more than 0.015 Pa · s, using a rotating viscosimeter with a No. 0 rotator (Appendix VI G) at the speed of 30 rpm.

Alkaline value Dissolve 1 g, previously dried to constant weight at 110°C (for about 5 hours) and accurately weighed, in 25 ml of dichloromethane, add 50 ml of glacial acetic acid and 5 ml of mercuric acetate TS, mix well and add 3 drops of quinidine red IS, titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes from red to colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 5.61 mg of KOH. The value is 23.9-32.3 mg/g, calculated on the dried basis.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of methacrylic acid copolymer I (Appendix XVI).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce a solution of 1 mg per ml as test solution; Dissolve an accurately weighed quantity of methacrylic acid CRS, ethyl acrylate CRS and methyl methacrylate CRS in methanol to produce a reference solution of each 3 µg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer [dissolve 3.55 g of disodium hydrogen phosphate (Na_2HPO_4) and 3.40 g of potassium dihydrogen phosphate (KH_2PO_4) in 1000 ml of water, and adjust the pH to 2.0 with phosphoric acid] (2 : 8) as the mobile phase. Detection wavelength is 202 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of methacrylic acid and the resolution factor between the peaks of ethyl acrylate and methyl methacrylate complies with the related requirements. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatograms. Calculate the content of each monomer impurity separately with respect to the peak area obtained in the chromatogram by the external standard method. The sum of contents is not more than 0.3%.

Loss on drying When dried at 110°C for 6 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.003%.

Arsenic Transfer 1.0 g to a 150 ml conical flask, add 5 ml of sulfuric acid, heat until the substance is thoroughly charred, add concentrated hydrogen peroxide solution dropwise (if a lot of foam is involved, stop heating and rotate the conical flask to prevent the unreacted substance conglomerating at the bottom) until the solution is colourless. Allow to cool, add cautiously 10 ml of water, heat again until sulfur trioxide is evolved, cool and add

slowly 5 ml of hydrochloride acid and a quantity of water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, and stored at a cool place.

Methacrylic Acid Copolymer II

Methacrylic acid copolymer II is a copolymer of methyl methacrylate, ethyl acrylate and trimethyl ammonium chloride ethyl methacrylate in a ratio of 65 : 30 : 5.

Description Slightly white, translucent or transparent solid with different shape and size. Sparingly soluble in acetone; practically insoluble in boiling water or isopropanol.

Refractive index Dissolve 1.25 g in 10 ml of isopropanol-acetone (6 : 4), the refractive index is 1.380-1.385 (Appendix VI F).

Viscosity Dissolve 6.0 g in 100 ml of 75% ethanol solution, the kinematic viscosity at 20°C is not more than 0.015 Pa. s, using a rotating viscosimeter with a No. 0 rotator (Appendix VI G, method 2) at the speed of 30 rpm.

Alkaline value Dissolve 1 g, previously dried to constant weight at 110°C (for about 5 hours) and accurately weighed, in 25 ml of dichloromethane, add 50 ml of glacial acetic acid, 5 ml of mercuric acetate TS, mix and add 3 drops of quinaldine red IS, titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes from red to colourless. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 5.61 mg of KOH. The value is 12.1-18.3 mg/g, calculated on the dried basis.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of methacrylic acid copolymer (Appendix XVI).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce a solution of 1 mg per ml as test solution; Dissolve an accurately weighed quantity of methacrylic acid CRS, ethyl acrylate CRS and methyl methacrylate CRS in methanol to produce a reference solution of each 3 µg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate buffer [dissolve 3.55 g of disodium hydrogen phosphate (Na_2HPO_4) and 3.40 g of potassium dihydrogen phosphate (KH_2PO_4) in 1000 ml of water, and adjust the pH to 2.0 with phosphoric acid] (2 : 8) as the mobile phase. Detection wavelength is 202 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of methacrylic acid and the resolution factor between the peaks of ethyl acrylate and methyl methacrylate complies with the related requirements. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatograms. Calculate the content of each monomer impurity separately with respect to the peak area obtained in the chromatogram by the external standard method. The sum of contents is not more than 0.3%.

Loss on drying When dried at 110°C for 6 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII

N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.003%.

Arsonic Transfer 1.0 g to a 150 ml conical flask, add 5 ml of sulfuric acid, heat until the substance is thoroughly charred, add concentrated hydrogen peroxide solution dropwise (if a lot of foam is involved, stop heating and rotate the conical flask to prevent the unreacted substance conglomerating at the bottom) until the solution is colourless. Allow to cool, add cautiously 10 ml of water, heat again until sulfur trioxide is evolved, cool and add slowly 5 ml of hydrochloride acid and a quantity of water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Category Pharmaceutical aid.

Storage Preserve in tightly closed containers, and stored at a cool place.

Methadone Hydrochloride

$\text{C}_{21}\text{H}_{27}\text{NO} \cdot \text{HCl}$ 345.91

[1095-90-5]

Methadone Hydrochloride is 6-(dimethylamino)-4,4-diphenyl-3-heptanone hydrochloride. It contains not less than 98.5% of $\text{C}_{21}\text{H}_{27}\text{NO} \cdot \text{HCl}$, calculated on the dried basis.

Description A colourless crystal or white crystalline powder; odourless.

Freely soluble in ethanol or chloroform; soluble in water; practically insoluble in ether.

Melting range 230-234°C (Appendix VI C).

Identification (1) Dissolve 50 mg in 5 ml of water, add sodium hydroxide TS to make alkaline; a precipitate is produced. Filter, wash with water for several times and dry it in vacuum over sulfuric acid, the melting point is about 76°C (Appendix VI C).

(2) Dissolve 10 mg in 2 ml of water, add 2 ml of methyl orange IS; a yellow precipitate is produced.

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 4.5-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 0.50 g in 15 ml of water add 2 ml of acetate buffer (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay To about 0.15 g, accurately weighed, in a separator add 50 ml of water and 5 ml of sodium hydroxide TS, then extract with ether for 4 times (40 ml, 20 ml, 15 ml and 15 ml). Combine the ether extracts, wash twice with water.

each of 5 ml. Combine the washings, extract with 10 ml of ether. Combine all the ether extracts, add accurately 30 ml of sulfuric acid (0.01 mol/L) VS, mix well. Evaporate ether at a low temperature, allow it to cool to room temperature, add 2 drops of methyl red IS and titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 6.918 mg of $C_{21}H_{27}NO \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed containers.

Preparation (1) Methadone Hydrochloride Injection
(2) Methadone Hydrochloride Tablets

Methadone Hydrochloride Injection

Methadone Hydrochloride Injection is a sterile solution of Methadone Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

Description A clear, colourless liquid.

Identification Complies with tests (1) and (2) for Identification described under Methadone hydrochloride.

pH value 4.5-6.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to 50 mg of methadone hydrochloride in a separator. Carry out the Assay described under Methadone Hydrochloride beginning at the words "add 5 ml of sodium hydroxide TS...". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 6.918 mg of $C_{21}H_{27}NO \cdot HCl$.

Category As described under Methadone Hydrochloride.

Strength 1 ml : 5 mg

Storage Preserve in well closed containers.

Methadone Hydrochloride Tablets

Methadone Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of labelled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

Description White tablets.

Identification Triturate a quantity of the powdered tablets equivalent to about 60 mg of methadone hydrochloride with 10 ml of warm ethanol, filter and evaporate the filtrate on a water bath to dryness. The residue complies with the tests for identification (1) and (2) described under Methadone Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 50 tablets. To a quantity of the powdered tablets equivalent to 50 mg of methadone hydrochloride, accurately weighed, in a separator add 20 ml of water. Carry out the Assay described under Methadone Hydrochloride, beginning at the words "add 5 ml of sodium hydroxide TS...". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to

6.918 mg of $C_{21}H_{27}NO \cdot HCl$.

Category As described under Methadone Hydrochloride.

Strength 2.5 mg

Storage Preserve in tightly closed containers.

Methenamine

$C_6H_{12}N_4$ 140.19

Methenamine is hexamethylenetetramine. It contains not less than 99.0% of $C_6H_{12}N_4$, calculated on the dried basis.

Description Colourless lustrous crystals or a white crystalline powder; almost odourless; taste, sweet then bitter. When brought into contact with fire, it burns with a smokeless flame; its aqueous solution exhibits alkaline reaction. Freely soluble in water; soluble in ethanol or chloroform; slightly soluble in ether.

Identification (1) Dissolve 0.5 g in 5 ml of dilute sulfuric acid and heat, a formaldehyde odour is perceptible which darkens paper moistened with silver nitrate TS. Add an excess of sodium hydroxide TS, ammonia is produced which changes moist red litmus paper to blue.
(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methenamine (Appendix XVI).

Chloride Carry out the limit test for chlorides (Appendix VII A), using 2.5 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.002%).

Ammonium salts and paraformaldehyde Dissolve 0.50 g in 10 ml of ammonia-free distilled water, add 1.0 ml of alkaline mercuric potassium iodide TS immediately, mix well and allow to stand for 2 minutes at 20-25°C. Any colour produced is not more intense than that of a reference solution prepared by mixing 1.0 ml of alkaline mercuric potassium iodide TS with 10 ml of ammonia-free distilled water; any opalescence produced is not more pronounced than that of a reference suspension prepared by mixing well (0.60 ml of potassium sulfate standard solution and 7 ml of water with 1 ml of dilute hydrochloric acid, and 2 ml of 25% barium chloride solution and allow to stand for 10 minutes).

Loss on drying When dried over sulfuric acid to constant weight, loses not more than 1.5% of its weight (Appendix VIII L).

Heavy metals Dissolve 4.0 g in 20 ml of water, filter if necessary, add a few drops of ammonia TS to the filtrate and dilute to 25 ml with water. Carry out the limit test for heavy metals (Appendix VIII H, method 3); not more than 0.0005%.

Assay Dissolve 0.5 g, accurately weighed, in 10 ml of water, add 50 ml of sulfuric acid (0.25 mol/L) VS accurately measured, and mix well. Heat to boiling until formaldehyde odour is expelled with adding water from time to time to compensate the evaporated water. Cool the resulting solution to room temperature, add 2 drops of methyl red IS, titrate with sodium hydroxide (0.5 mol/L)

VS. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.25 mol/L) VS is equivalent to 17.52 mg of $C_6H_{12}N_4$.

Category Antiseptic, Disinfectant.

Storage Preserve in tightly closed containers.

Methionine

$C_5H_{11}NO_2S$ 149.21

Methionine is (S)-2-amino-4-(methylthio) butanoic acid. It contains not less than 98.5% of $C_5H_{11}NO_2S$, calculated on the dried basis.

Description White crystals or crystalline powder; odour, characteristic.

Soluble in water, very slightly soluble in ethanol, insoluble in ether, freely soluble in dilute hydrochloric acid or sodium hydroxide solutions.

Specific optical rotation +21.0° to +25.0°, in a solution of 20 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Methionine (Appendix XVI).

Acidity Dissolve 0.5 g in 50 ml of water, pH 5.6-6.1 (Appendix VI H).

Transmittance of solution Dissolve 0.5 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-glacial acetic acid-water (4 : 1 : 5) as the mobile phase. Apply to the plate 5 µl of a solution of the substance being examined in water containing 10 mg per ml. After developing and removal of the plate, dry it in air, spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone), heat at 90°C until the colour is produced and examine immediately. There is only one purple spot in the chromatogram.

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than

that of a reference solution using 1.5 ml of iron standard solution (0.0015%).

Heavy metals Dissolve 0.50 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.025 EU per mg of methionine (for parenteral administration).

Assay Dissolve about 0.13 g, accurately weighed, in 3 ml of dehydrated formic acid, and 50 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 14.92 mg of $C_5H_{11}NO_2S$.

Category Amino acid.

Storage Preserve in tightly closed containers.

Methotrexate

$C_{20}H_{22}N_8O_5$ 454.45

[59-05-2]

Methotrexate is a mixture of 4-amino-10-methylfolate acid and closely related compounds, consists chiefly of *N*-[4-[[[(2,4-diamino-6-pteridinyl) methyl] methylamino] benzoyl]-L-glutamate. It contains not less than 90.0% of $C_{20}H_{22}N_8O_5$, calculated on the dried basis.

Description An orange-yellow crystalline powder. Practically insoluble in water, ethanol, chloroform or ether; freely soluble in dilute alkali hydroxides solutions; soluble in dilute hydrochloric acid.

Identification (1) Dissolve 5 mg in 1 ml of 0.5% ammonium carbonate solution, dilute with hydrochloric acid solution (9→1000) to produce a solution of 10 µg per ml. The light absorption of the solution exhibits two maxima at 244 nm and 306 nm, and two minima at 234 nm and 262 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methotrexate (Appendix XVI).

Loss on drying When dried in vacuum, over phosphorus pentoxide to constant weight at 100°C, loses not more than 12.0% of its weight (Appendix VIII L).

Assay Carry out the method of high performance liquid chromatography (Appendix V B) with an octadecylsilane bonded silica gel column, using a mixture of acetonitrile-7.0% citric acid solution-2.0% disodium hydrogen phosphate (anhydrous) solution (10 : 10 : 80) as the mobile phase.

The wavelength of the detector is 302 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of methotrexate; the resolution factor between the peaks of methotrexate and folic acid is not less than 8.0.

Dissolve an accurately weighed quantity of the substance being examined and methotrexate CRS separately in the mobile phase to produce solutions of 0.1 mg per ml. Inject 10 μ l each of the solutions into the column. Calculate the content of $C_{20}H_{22}N_8O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation (1) Methotrexate for Injection
(2) Methotrexate Tablets

Methotrexate for Injection

Methotrexate for Injection is a sterile, lyophilized preparation of the sodium salt of Methotrexate and a quantity of sodium chloride. It contains not less than 85.0% and not more than 110.0% of the labelled amount of Methotrexate ($C_{20}H_{22}N_8O_5$).

Description A yellow or brownish yellow, friable mass or powder.

Identification Complies with test (1) for Identification described under Methotrexate.

Alkalinity Dissolve the contents of 5 containers separately in 2 ml portions of water, combine the solutions and mix well, pH 7.0-9.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 100°C, loses not more than 5.0% of its weight (Appendix VIII L).

Content uniformity Dissolve the contents of 10 containers individually in 1 ml of water and dilute with hydrochloric acid solution (9→1000) to produce a solution of about 10 μ g per ml. Measure the absorbances of the resulting solutions at 306 nm (Appendix IV A). Compare the absorbance of the content of each container with the average absorbance of the contents of 10 containers. Not more than 1 individual absorbance deviates from the average absorbance by a value greater than $\pm 15\%$; and none of the deviation is greater than $\pm 25\%$ (for strength 5 mg).

Sterility Dissolve the contents individually in sterile water to produce a solution of 2.5 mg per ml, the solution complies with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve an accurately weighed quantity of the contents obtained in the test for weight variation of contents in mobile phase to produce a solution of about 0.1 mg per ml (for strength 100 mg) or dissolve the contents of 5 containers in mobile phase in a 250 ml volumetric flask, dilute to volume and mix well (for strength 5 mg). Carry out the Assay described under Methotrexate, using the resulting solution.

Category As described under Methotrexate.

Strength (1) 5 mg (2) 100 mg

Storage Preserve in well closed containers, protected from light and stored in a cool place.

Methotrexate Tablets

Methotrexate Tablets contain not less than 85.0% and not more than 110.0% of the labelled amount of methotrexate ($C_{20}H_{22}N_8O_5$).

Description Slightly orange-yellow tablets.

Identification Comply with test (1) for Identification described under Methotrexate.

Content uniformity Triturate 10 tablets individually with 2.5 ml of dilute ammonia solution (to 10 ml of water add 2 drops of concentrated ammonia solution) for 5 minutes (protect from strong light); transfer to a 50 ml volumetric flask with a quantity of water and add water to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, add 5 ml of (0.5 mol/L) hydrochloric acid solution and then add water to volume, mix well. Measure the absorbance of the resulting solution at 306 nm (Appendix IV A). Compare the absorbance of each tablet with the average absorbance of 10 tablets. Not more than 1 individual absorbance deviates from the average absorbance by a value greater than $\pm 15\%$; and none of the deviation is greater than $\pm 25\%$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium. Adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Measure the absorbances of the successive filtrate and that of methotrexate CRS solution at 306 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{22}N_8O_5$ from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powder, equivalent to about 10 mg of methotrexate in 25 ml volumetric flask add 20 ml of the mobile phase, dissolve methotrexate by ultrasonic treatment, dilute to volume with mobile phase, mix well and filter. Inject 10 μ l of the successive filtrate into the column. Complete the Assay described under Methotrexate.

Category As described under Methotrexate.

Strength 2.5 mg

Storage Preserve in tightly closed containers, protected from light.

Methoxamine Hydrochloride

$C_{11}H_{17}NO_3 \cdot HCl$ 247.72

[61-16-5]

Methoxamine Hydrochloride is α -(1-aminoethyl)-2,5-dimethoxy-benzenemethanol hydrochloride. It contains not less than 99.0% of $C_{11}H_{17}NO_3 \cdot HCl$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless or

almost odourless; taste, bitter.

Freely soluble in water; soluble in ethanol; practically insoluble in chloroform or ether.

Melting range 214-219°C, with decomposition (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 30 µg per ml in water at 290 nm (Appendix IV A), the values of A (1%, 1 cm) is 133-141.

Identification (1) To 1 mg add 3 drops of formaldehyde-sulfuric acid TS; a purple colour is produced changing slowly to brown and then to green.

(2) To 20 mg add 2 ml of water and 0.5 ml of silver nitrate TS; a white curdy precipitate is produced, which is soluble in ammonia TS but insoluble in nitric acid.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methoxamine hydrochloride (Appendix XVI).

Acidity Dissolve 0.20 g in 10 ml of water, pH 4.5-6.0 (Appendix VI H).

Ketonic amine The light absorbance of a solution of 1.5 mg per ml in water at 347 nm (Appendix IV A) is not greater than 0.06.

Loss on drying When dried at 105°C for 2 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid and 5 ml of mercuric acetate TS by warming, if necessary, add 10 drops of naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.77 mg of $C_{11}H_{17}NO_3 \cdot HCl$.

Category α-Adrenergic receptor stimulant.

Storage Preserve in tightly closed containers.

Preparation Methoxamine Hydrochloride Injection

Methoxamine Hydrochloride Injection

Methoxamine Hydrochloride Injection is a sterile solution of Methoxamine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of methoxamine hydrochloride ($C_{11}H_{17}NO_3 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Evaporate 2-3 drops to dryness in a porcelain dish, cool, add 3 drops of formaldehyde-sulfuric acid TS; a purple colour is produced, changing slowly to brown and finally to green.

(2) To 1 ml, add 0.5 ml of silver nitrate TS; a white curdy precipitate is produced, which is soluble in ammonia TS but insoluble in nitric acid.

pH value 3.0-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 100 mg of methoxamine hydrochloride to a 250 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with

water to volume and mix well. Measure the absorbance of the resulting solution at 290 nm (Appendix IV A) and calculate the content of $C_{11}H_{17}NO_3 \cdot HCl$, taking 137 as the value of A (1%, 1 cm).

Category As described under Methoxamine Hydrochloride.

Strength (1) 1 ml : 10 mg (2) 1 ml : 20 mg

Storage Preserve in well closed containers.

Methyldopa

$C_{10}H_{13}NO_4 \cdot 1 \frac{1}{2} H_2O$ 238.24

[41372-08-1]

Methyldopa is L-3 (3,4-dihydroxyphenyl)-2-methylalanine sesquihydrate. It contains not less than 98.0% of $C_{10}H_{13}NO_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Sparingly soluble in water; slightly soluble in ethanol; very slightly soluble in ether; freely soluble in dilute hydrochloric acid.

Specific optical rotation -25° to -30° , in a solution of 44 mg per ml of aluminium trichloride solution (to 65 g of aluminium trichloride hexahydrate, add water to 100 ml and 0.5 g of active carbon, shake for 10 minutes, filter and adjust the pH of the filtrate to 1.5 with 1% sodium hydroxide solution) (Appendix VI E).

Identification (1) The light absorption of a solution of 0.04 mg per ml in 0.1 mol/L hydrochloric acid solution exhibits maximum at 280 nm; the absorbance is about 0.48 (Appendix IV A)

(2) To about 10 mg add 3 drops of ninhydrin TS, a deep purple colour is produced on standing.

Acidity Dissolve 1.0 g in 100 ml of freshly boiled and cooled water, add 1 drop of methyl red IS, the red colour produced, becomes yellow on the addition of 0.5 ml of sodium hydroxide (0.1 mol/L) VS.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.028%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of n-butanol-glacial acetic acid-water (65 : 15 : 25) as the mobile phase. Apply separately to the plate 20 µl each of two solutions in methanol containing (1) 10 mg per ml (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with p-nitroaniline solution [to 0.3 g of p-nitroaniline add a mixture of 100 ml of hydrochloric acid solution (9→10) and 5% sodium nitrite (9 : 1)], dry in air, then spray with 25% sodium carbonate solution, any spot, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 125 °C, loses 10.0%-13.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained under Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.12 mg of $C_{10}H_{13}NO_4$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Methyldopa Tablets

Methyldopa Tablets

Methyldopa Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of methyldopa ($C_{10}H_{13}NO_4$).

Description Sugar coated tablets with white core.

Identification (1) Dissolve a quantity of the powdered tablets in 0.1 mol/L hydrochloric acid solution to produce a solution of methyldopa of 0.04 mg per ml and filter. The light absorption of the filtrate exhibits a maximum at 280 nm (Appendix IV A).

(2) To a quantity of powdered tablets equivalent to about 10 mg of methyldopa add a few drops of ninhydrin TS, a deep purple is produced gradually on heating.

Dissolution Carry out dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with dissolution medium to 10 ml and mix well. Dissolve methyldopa CRS, in hydrochloric acid solution (9→1000) to produce a solution of 0.04 mg per ml. Measure the absorbances of the resulting solutions at 280 nm (Appendix IV A). Calculate the dissolution of $C_{10}H_{13}NO_4$ from each tablet, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with sugar coating removed. Transfer a quantity of the powder equivalent to about 0.1 g of methyldopa, accurately weighed, in a 100 ml volumetric flask, add a quantity of 0.05 mol/L sulfuric acid solution, shake to dissolve methyldopa, dilute with 0.05 mol/L sulfuric acid solution to volume, mix well and filter. Measure accurately 5 ml of successive filtrate into another 100 ml volumetric flask, add 2 ml of citric acid ferrous sulfate solution [Dissolve 1 g of sodium pyrosulfite in 200 ml of water, add 1 ml of hydrochloric acid (1 mol/L) VS, 1.5 g of ferrous sulfate and 10 g of sodium citrate, shake thoroughly. Be prepared freshly] and 8 ml of amino acetate BS [Shake 42 g of sodium bicarbonate and 50 g of potassium bicarbonate with 180 ml of water as solution 1. Dissolve 37.5 g of amino acetic acid in 15 ml of concentrated ammonia TS and 180 ml of water as solution 2. Mix the two solutions, make up to 500 ml with water], add water to volume and mix well. Weigh accurately 0.1 g of methyldopa CRS in 100 ml volumetric

flask, dilute with 0.05 mol/L sulfuric acid solution to the volume and mix well. Transfer 5 ml of the above solution in a 100 ml volumetric flask, measured accurately, prepare a solution as described above, beginning at the words "add 2 ml of citric acid ferrous sulfate solution...". Measure the absorbances of the solutions at 550 nm (Appendix IV B). Weigh accurately 0.1 g of methyldopa CRS to a 100 ml volumetric flask, add sulfuric acid solution (0.05 mol/L) to volume and mix well. Measure accurately 5 ml of the solution to a 100 ml volumetric flask, proceed as described above beginning at the words "add 2 ml of citric acid ferrous sulfate solution...". Calculate the content of $C_{10}H_{13}NO_4$.

Category As described under Methyldopa.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Methylenediphosphonate and Stannous Chloride for Injection

Methylenediphosphonate and Stannous Chloride for Injection is a sterile, lyophilized mixture of Methylenediphosphonic Acid and Stannous Chloride. It contains not less than 80.0% and not more than 120.0% of the labelled amount of Methylenediphosphonic acid ($CH_6O_6P_2$).

Description A white lyophilized powder. Freely soluble in water.

Identification (1) To the diluted solution of the residue obtained after ignition in the Assay add ammonium molybdate TS, a yellow colour is produced.

(2) Dissolve the contents of 1 container in 0.5 ml of Sodium Chloride Injection, apply 1 drop of the solution to a strip of ammonium phosphomolybdate TP, a blue colour is produced.

Clarity and colour of solution Dissolve the contents of 1 container in 5 ml of Sodium Chloride Injection, the solution is clear and colourless.

Stannous chloride Dissolve the contents of 5 containers separately in 3 ml of 1 mol/L hydrochloric acid solution, previously saturated with nitrogen. Carry out the method for potentiometric titration (Appendix VII A) under a current of nitrogen, titrate with potassium iodate (0.001667 mol/L) VS. Not less than 0.07 ml is consumed for each container. Repeat the test with another 5 containers if one of them failed to comply with the requirement, all the containers in the second test must comply with the requirement.

Acidity The pH value of the solution obtained in the test for Clarity and colour of solution is 5.0-7.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), using suitable amount of the solution by dissolving the content in 5 ml of water BET and diluted to 10 times of its volume with water BET; not more than 75 EU each container.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 3 containers respectively in 2 ml of water, measured accurately, combine the solutions and mix well. To 2 ml of the solution add 2 ml of 2% hydrochloric acid solution, both measured accurately, mix well and pass hydrogen sulfide into the solution until precipitation is complete. Centrifuge and decant the supernate liquid, expel the excess hydrogen sulfide with a current of air.

Transfer 1 ml of the liquid, measured accurately, to a crucible containing 0.2 g of calcium hydroxide, stir well and evaporate to dryness on a water bath. Ignite until the residue is greyish-white in colour, cool and dissolve it in 10 ml of dilute hydrochloric acid. Transfer the solution to a 50 ml volumetric flask, dilute with water to volume and mix well. Transfer 4 ml, measured accurately, to a 25 ml volumetric flask, add 5 ml of molybdo-ascorbic acid solution (mix 9 ml of dilute sulfuric acid with 3 ml each of 2.5% ammonium molybdate solution and 10% ascorbic acid solution), dilute with water to volume and mix well. Warm for 30 minutes in a water bath at 45°C, measure the absorbance (E_1) of the resulting solution at 550 nm (Appendix IV A). Transfer 1 ml of the liquid removed from hydrogen sulfide, measured accurately to a 50 ml volumetric flask, add 0.2 g of calcium hydroxide and 10 ml of dilute hydrochloric acid, dilute with water to volume and mix well. Proceed as described above, beginning at the words "Transfer 4 ml, measured accurately..." Measure the absorbance (E_2) of the solution at the same wavelength.

Place 2 ml of potassium dihydrogen phosphate standard solution (0.05 mg phosphorus per ml), measured accurately, pass hydrogen sulfide into the solution, then expel the excess hydrogen sulfide with a current of air. Transfer 1 ml of the solution to a 25 ml volumetric flask, add 5 ml of molybdo-ascorbic acid solution, dilute to volume with water. Proceed as described above, beginning at the words "mix well...". Measure the absorbance (E_3). Calculate the content of phosphorus (P) in the sample multiplied with 7.102, representing the content of methylenediphosphonic acid ($\text{CH}_3\text{O}_3\text{P}_2$).

Category Used for the preparation of Technetium [$^{99\text{m}}\text{Tc}$] Methylenediphosphonate Injection.

Strength 5 mg of methylenediphosphonic acid and 0.5 mg of stannous chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$).

Storage Preserve in tightly closed containers, stored at 2-8°C in a dark place.

Methylphenidate Hydrochloride

$\text{C}_{14}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$ 269.77

[298-59-9]

Methylphenidate Hydrochloride is α -phenyl-2-piperidine methylacetate hydrochloride. It contains not less than 98.0% of $\text{C}_{14}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$, calculated on the dried basis.

Description A white crystalline powder; odourless. Freely soluble in water or methanol; soluble in ethanol; slightly soluble in chloroform; practically insoluble in acetone.

Identification (1) The light absorption of a 1.0 mg per ml solution in ethanol exhibits three maxima at 252 nm, 258 nm and 264 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methylphenidate hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer

chromatography (Appendix V B), using silica gel G as the coating substance and chloroform-methanol-concentrated ammonia solution (19 : 1 : 0.1) as the mobile phase. Apply separately to the plate 10 μl each of two solutions of the substance being examined in methanol containing (1) 100 mg per ml (2) 1.0 mg per ml. After developing and removal of the plate, dry it in air and spray with potassium iodobismuthate TS. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum at 60°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1) using 1.0 g; not more than 0.0010%.

Assay Dissolve about 0.2 g, accurately weighed, in 15 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 4 drops of naphtholbenzein IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.98 mg of $\text{C}_{14}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$.

Category Central stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Methylphenidate Hydrochloride Tablets

Methylphenidate Hydrochloride Tablets

Methylphenidate Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of methylphenidate hydrochloride ($\text{C}_{14}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$).

Description White tablets.

Identification To the filtrate obtained in the Assay add methanol to produce a solution of 1.0 mg per ml. It complies with test (1) for Identification described under Methylphenidate Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 60 tablets. Transfer an accurately weighed quantity of the powdered tablets, equivalent to about 0.25 g of methylphenidate hydrochloride to a 50 ml volumetric flask. Add 30 ml of methanol, warm and shake thoroughly. Cool, dilute with methanol to volume and mix well. Filter, measure accurately 20 ml of the successive filtrate evaporate to dryness on a water bath. Then proceed as directed in the Assay described under Methylphenidate hydrochloride, beginning at the words "Dissolve in 15 ml of glacial acetic acid...". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.98 mg of $\text{C}_{14}\text{H}_{19}\text{NO}_2 \cdot \text{HCl}$.

Category As described under Methylphenidate Hydrochloride.

Strength 10 mg

Storage Preserve in tightly closed containers.

Methylrosanilinium Chloride

Methylrosanilinium Chloride is a mixture of tetrapenta- and hexamethylpararosanine chloride.

Description Dark greenish-violet granular powders or greenish-violet pieces with a metallic lustre; odour, very slight.

Soluble in ethanol and chloroform; sparingly soluble in water; insoluble in ether.

Identification (1) Sprinkle about 1 mg to 1 ml of sulfuric acid, it dissolves in the acid, an orange or brownish-red colour is produced. Dilute cautiously with water, the colour changes to brown, then to green, and finally to blue.

(2) Dissolve about 20 mg in 10 ml of water, add 5 drops of hydrochloric acid, mix well. To 5 ml of this solution add tannic acid TS dropwise; a deep blue precipitate is produced.

(3) To the remainder of the solution prepared for test (2) add about 0.5 g of zinc powder and warm the mixture; rapid decolourisation occurs. Place 1 drop of the decolourised solution adjacent to 1 drop of ammonia TS on a filter paper; the region of contact assumes a blue colour.

Ethanol-insoluble matter Boil 1.0 g with 50 ml of ethanol under reflux for 15 minutes, filter with a sintered glass crucible, previously dried to constant weight at 105°C. Wash the residue with hot ethanol until the washings cease to be violet, dry to constant weight at 105°C, the residue is not more than 0.5%.

Loss on drying When dried to constant weight at 105°C, loses not more than 7.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.5% (Appendix VIII N); using 0.5 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.005%.

Arsenic Mix 0.20 g with 0.5 g of calcium hydroxide, add small amount of water, mix well and allow to dry. Heat gently to carbonization then ignite at 500-600°C, until the incineration is complete. Cool, dissolve it in 5 ml of hydrochloric acid and 23 ml of water. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.001%).

Category Antiseptic, Disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Methylrosanilinium Chloride Solution

Methylrosanilinium Chloride Solution

Methylrosanilinium Chloride Solution contains not less than 0.85% (g/ml) and not more than 1.05% (g/ml) of Methylrosanilinium Chloride.

Formula	Methylrosanilinium Chloride	10 g
	Ethanol	sufficient quantity
	Water	sufficient quantity

To make	1000 ml
---------	---------

Processing Dissolve Methylrosanilinium Chloride in sufficient quantity of ethanol, add water to 1000 ml and filter.

Description Violet liquid.

Identification (1) To 5 ml add 2 drops of hydrochloric acid and add tannic acid TS dropwise; a deep blue precipitate is produced.

(2) Evaporate 2 ml on a water bath to dryness. Sprinkle a small amount of the residue to 1 ml of sulfuric acid; it dissolves in the acid, an orange or brownish-red colour is produced. Dilute cautiously with water, the colour changes to brown, then to green and finally to blue.

Fill Comply with the requirements for Minimum Fill (Appendix X F).

Assay Measure accurately 10 ml to an evaporating dish, previously dried to constant weight at 105°C. Evaporate on a water bath to dryness, dry to constant weight at 105°C. Calculate the content of Methylrosanilinium Chloride.

Category As described under Methylrosanilinium Chloride

Storage Preserve in tightly closed containers, protected from light.

Methyltestosterone

$C_{20}H_{30}O_2$ 302.46

[58-18-4]

Methyltestosterone is 17 β -hydroxy-17 α -methyl-androst-4-en-3-one. It contains not less than 97.0% and not more than 103.0% of $C_{20}H_{30}O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, tasteless; slightly hygroscopic.

Freely soluble in ethanol, acetone or chloroform; sparingly soluble in ether; slightly soluble in vegetable oil; insoluble in water.

Melting range 163-167°C (Appendix VI C).

Specific optical rotation +79° to +85°, in a solution of about 10 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve a quantity mg in 1 ml of sulfuric acid-ethanol (2 : 1), a yellow colour is produced with a yellowish-green fluorescence.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methyltestosterone (Appendix XVI).

Related substances Carry out the method as described under Assay. Inject 10 μ l of the solution into the column, adjust the attenuation so that the principal peak height is about 25% of full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce solutions of 0.6 mg per ml (solution 1) and 0.012 mg per ml (solution 2), inject separately 10 μ l each of solution (1) and (2) into the column, and record the chromatograms for twice the retention times of the principal peak. Not more than three secondary peaks in the chromatogram are obtained with solution (1), each secondary peak area and the sum of the areas of all secondary peaks are not greater than 1/2 and 3/4 of the principal peak area in the chromatogram obtained

with solution (2) correspondingly.

Loss on drying When dried at 105°C for 2 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), with an octadecylsilane bonded silica gel column, using methanol-water (72 : 28) as the mobile phase and the detection wavelength is 241 nm. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of methyltestosterone. The resolution factor between the peaks of methyltestosterone and internal standard complies with the related requirements.

Internal Standard Solution Dissolve about 10 mg of norethisterone, accurately weighed, in methanol in a 10 ml volumetric flask, dilute to volume and mix well.

Procedure Dissolve about 12 mg of methyltestosterone CRS, accurately weighed, in methanol in a 10 ml volumetric flask, dilute to volume and mix well. Transfer 1 ml each of the solution and the internal standard solution, both accurately measured, in a 10 ml volumetric flask, dilute with methanol to volume, mix well. Inject 10 µl of the resulting solution into the column, repeat the operation, using the substance being examined instead of methyltestosterone CRS, calculate the content of $C_{20}H_{30}O_2$ with respect to the peak area obtained in the chromatogram by the

Category Androgen.

Storage Preserve in tightly closed containers, protected from light.

Preparation Methyltestosterone Tablets

Methyltestosterone Tablets

Methyltestosterone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of methyltestosterone ($C_{20}H_{30}O_2$).

Description White tablets.

Identification To a quantity of finely powdered tablet equivalent to 10 mg of methyltestosterone add 10 ml of ethanol or chloroform, stir well, filter, evaporate the filtrate to dryness on a water bath, the residue complies with tests (1) and (3) for Identification described under Methyltestosterone.

Content uniformity Dissolve 1 tablet in a 50 ml volumetric flask in a quantity of absolute ethanol, shake well, dilute to volume with absolute ethanol and mix well, filter. Measure accurately 5 ml of the successive filtrate to another 50 ml volumetric flask, add absolute ethanol to volume and mix well. Determine the content of methyltestosterone as described under Assay. The content of each of the ten tablets comply with the requirements (Appendix X E).

Dissolution Carry out dissolution test (Appendix X C, method 2), using 500 ml of ethanol (5 → 100) as the dissolution medium, adjust the rotation speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Discard the initial filtrate. Measure the absorbance of the successive filtrate at 249 nm (Appendix IV A). Treat a quantity of methyltestosterone CRS instead of the substance being examined in the same manner. Calculate the dissolution of $C_{20}H_{30}O_2$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements

for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets, transfer an accurately weighed quantity of the powder equivalent to about 20 mg of methyltestosterone into a 100 ml volumetric flask, add dehydrated ethanol and shake to dissolve the methyltestosterone, dilute with dehydrated ethanol to volume and mix well, filter, discard the initial filtrate, transfer 5 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, add dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 240 nm (Appendix IV A). Calculate the content of $C_{20}H_{30}O_2$, taking 540 as the value of A (1%, 1 cm).

Category As described under Methyltestosterone.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Methylthioninium Chloride

$C_{16}H_{18}ClN_3S \cdot 3H_2O$ 373.90

[7220-79-3]

Methylthioninium Chloride is 3,7-bis (dimethylamino)-phenothiazine-5-ium chloride trihydrate. It contains not less than 98.5% of $C_{16}H_{18}ClN_3S$, calculated on the dried basis.

Description Dark green crystals or crystalline powder with a bronzelike luster; odourless. Freely soluble in water or ethanol; soluble in chloroform.

Identification (1) Dissolve about 10 mg in 50 ml of water, a deep blue colour is produced. To 10 ml of this solution add a mixture of 1 ml of sulfuric acid and 0.1 g of zinc powder, the blue colour of the solution disappears. Filter, the filtrate changes to blue again on standing in air or by adding 1 drop of hydrogen peroxide TS. Add a few drops of potassium iodide TS to 10 ml of this solution, a deep blue flocculent precipitate is produced, while the colour of supernatant liquid is pale blue. Add a few drops of 0.1 mol/L iodine solution to 10 ml of this solution, a deep brown colour is produced; add 0.1 mol/L sodium thiosulfate solution, the blue colour is produced again.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of methylthioninium chloride (Appendix XVI).

Loss on drying When dried to constant weight at 105°C, loses not more than 18.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 1.2% (Appendix VIII N).

Zinc Moisten 0.10 g with a few drops of sulfuric acid and ignite. Add 5 ml of dilute hydrochloric acid and 5 ml of water to the residue, boil, add 5 ml of ammonia TS and filter. Add 2 drops of ammonium sulfide TS to the filtrate, no precipitate or turbidity is produced.

Arsenic Mix 0.20 g with 0.5 g of calcium hydroxide and a small amount of water, stir and dry. Heat gently until it is charred, then ignite at 600-700°C until the incineration is completed. Cool, dissolve the residue in 5 ml of hydrochloric acid and 23 ml of water. It complies with the limit test for arsenic (Appendix VIII J, method 1) (0.001%).

Assay Dissolve about 0.2 g, accurately weighed, in 40 ml of water in a beaker, heat on a water bath to 75°C. Add accurately 25 ml of potassium dichromate (0.01667 mol/L) VS, mix well and keep at 75°C for 20 minutes. Cool, filter with a sintered-glass funnel. Wash the beaker and funnel with water for 4 times, each o 2.5 ml. Filter, combine the filtrates and washings, transfer to a stoppered flask. Add 250 ml of water, 25 ml of sulfuric acid solution (1→5) and 10 ml of potassium iodide TS, mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS, adding 2 ml of starch IS towards the end of the titration and continue the titration until the blue colour just disappears. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS, is equivalent to 10.66 mg of $C_{16}H_{18}ClN_3S$.

Category Antidote.

Storage Preserve in tightly closed containers, protected from light.

Preparation Methylthioninium Chloride Injection

Methylthioninium Chloride Injection

Methylthioninium Chloride Injection is a sterile solution of Methylthioninium chloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_{16}H_{18}ClN_3S \cdot 3H_2O$.

It may contain 5 % of glucose.

Description A clear, deep blue liquid.

Identification Complies with test (1) for identification described under Methylthioninium Chloride.

pH value 3.5-5.0 (Appendix V H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve an accurately measured quantity equivalent to about 20 mg of Methylthioninium Chloride in dilute ethanol to produce a solution of 2 µg per ml. Measure the absorbance at 661 nm (Appendix IV A). Repeat the operation using a quantity of methylthioninium chloride CRS instead of the substance being examined. Calculate the content of $C_{16}H_{18}ClN_3S \cdot 3H_2O$, and multiply by 1.169.

Category As described under Methylthioninium Chloride.

Strength (1) 2 ml : 20 mg (2) 5 ml : 50 mg
(3) 10 ml : 100 mg

Storage Preserve in well closed containers, protected from light.

Metildigoxin

$C_{42}H_{66}O_{14}$ 794.98

[30685-43-9]

Metildigoxin is 3β -[(*O*-2,6-dideoxy-4-*O*-methyl- β -D-ribo-hexopyranosyl-(1→4))-*O*-2,6-dideoxy- β -D-ribo-hexopyranosyl-(1→4))-2,6-dideoxy- β -D-ribo-hexopyranosyl]oxy]-12 β , 14-dihydroxy-5 β , 14 β -card-20(22)-enolide. It contains not less than 95.0% of $C_{42}H_{66}O_{14}$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Sparingly soluble in chloroform; very slightly soluble in methanol or ethanol; practically insoluble in water.

Identification (1) Dissolve about 1 mg in 1 ml of glacial acetic acid solution containing ferric chloride (to 10 ml of glacial acetic acid add 1 drop of ferric chloride TS) in a test tube, add alongside the wall to form a subjacent layer, a violet colour formed at the junction of the liquids, and the glacial acetic acid layer turns to blue after standing.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of metildigoxin CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with reference spectrum of Metildigoxin (Appendix XI).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce two solutions of 0.25 mg per ml [solution (1)] and 0.0125 mg per ml [solution (2)]. Carry out the method as described under the Assay except using a mixture of acetonitrile-water (34 : 66) as the mobile phase. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% full scale of the chart. Then inject separately 20 µl each of solution (1) and (2) into the column and record the chromatogram for triple the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (40 : 60) as the mobile phase. Detection wavelength is 218 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of metildigoxin. The resolution factor between the peaks of metildigoxin and internal standard

complies with the related requirements.

Internal standard solution Dissolve a quantity of digitoxin CRS, accurately weighed, in mobile phase to produce a solution of 0.1 mg per ml, mix well.

Procedure Dissolve a quantity of metildigoxin CRS, accurately weighed, in mobile phase to produce a reference solution of 0.1 mg per ml. Transfer each 2 ml of the reference solution and the internal standard solution, accurately measured, in a 10 ml volumetric flask, dilute with mobile phase to volume and mix well, inject 20 μ l into the column. Repeat the operation, using the substance being examined instead of metildigoxin CRS, calculate the content of $C_{42}H_{66}O_{14}$.

Category Cardiotonic.

Storage Preserve in tightly closed containers.

Preparation Metildigoxin Tablets

Metildigoxin Tablets

Metildigoxin Tablets contain not less than 85.0% and not more than 115.0% of the labelled amount of metildigoxin ($C_{42}H_{66}O_{14}$).

Description White or almost white tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 1 mg of metildigoxin add 5 ml of a mixture of ethanol-chloroform (1 : 1). Shake vigorously for a few minutes and centrifuge, evaporate the centrifugate to dryness on a water bath at 60-70°C. The residue complies with test (1) for Identification described under Metildigoxin. (2) The retention time of principal peak of the metildigoxin in the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of metildigoxin CRS.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 tablet to a 5 ml volumetric flask. Carry out the procedure described under the Assay beginning at the words "Add 1 ml of the internal standard solution... measure accurately". Calculate the content of $C_{42}H_{66}O_{14}$. The limit of content uniformity is $\pm 20\%$.

Dissolution Comply with dissolution test (Appendix X C, method 3), using 100 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 60 rpm. Withdraw a quantity of the solution after exactly 60 minutes and filter through a membrane with pores of less than 0.45 μ m in diameter. Use the successive filtrate as the test solution. Dissolve metildigoxin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 1 μ g per 1 ml as the reference solution. Measure accurately 1 ml each of the solutions to two 10 ml volumetric flasks, respectively. Add 3.0 ml of 0.1% ascorbic acid in methanol solution and 0.2 ml of 0.009 mol/L hydrogen peroxide solution, dilute with 0.1 mol/L hydrochloric acid to volume, mix well. Allow to stand for 90 minutes at 30°C, cool to room temperature. Measure the fluorescence intensity of the resulting solutions (Appendix IV E), the excitation wavelength and the emission wavelength are 356 nm and 485 nm, respectively. Calculate the dissolution of $C_{42}H_{66}O_{14}$ from each tablet, not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. Transfer a quantity of the powder equivalent to about 0.1 mg of metildigoxin,

accurately weighed, to a 5 ml volumetric flask. Add 1 ml of internal standard solution, accurately measured. Add a quantity of mobile phase to dissolve the metildigoxin by ultrasonic treatment. Dilute with mobile phase to volume and filter. Use the successive filtrate as test solution. Carry out the Assay described under Metildigoxin, inject 20 μ l of the solution into the column. Repeat the operation. Calculate the content of $C_{42}H_{66}O_{14}$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Metildigoxin.

Strength 0.1 mg

Storage Preserve in tightly closed containers.

Metoclopramide

$C_{14}H_{22}ClN_3O_2$ 299.80

[364-62-5]

Metoclopramide is 4-amino-5-chloro-N-[2-(diethylamino)ethyl]-2-methoxy-benzamide. It contains not less than 99.0% of $C_{14}H_{22}ClN_3O_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Soluble in chloroform, sparingly soluble in ethanol or acetone, very slightly soluble in ether; practically insoluble in water; soluble in acid solutions.

Melting range 147-151°C (Appendix VI C).

Identification (1) To about 5 mg in a test tube add 1 ml of sulfuric acid, heat gently until the solution exhibits a violet-black colour. Add a few drops into 5 ml of water, mix well, a green fluorescence is produced, when made alkaline the fluorescence disappears.

(2) The light absorption of a solution of 10 μ g per ml in standard potassium tetraoxalate BS (Appendix VI H) exhibits a maximum at 309 nm, and a minimum at 290 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with reference spectrum of Metoclopramide (Appendix XVI).

Clarity of acid solution Dissolve 0.20 g in 1.5 ml of hydrochloric acid solution (9 \rightarrow 100), add water to 20 ml, the solution is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-butanol-concentrated ammonia solution (19 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in methanol containing (1) 10 mg per ml (2) 50 μ g per ml. After developing and removal of the plate, dry it at 80°C for 30 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

volumetric flask and dilute to volume, mix well, measure accurately a quantity, add the mobile phase to produce a solution of 0.3 mg per ml. Repeat the operation, calculate the content of $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$ with respect to the peak area obtained in the chromatogram by external standard method.

Sodium chloride Dilute 5 ml, accurately measured, with 40 ml of water, add 5 ml of 2% dextrin solution and 5 to 8 drops of fluorescent yellow IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg NaCl.

Category As described under Metoprolol Tartrate.

Strength (1) 2 ml : 2 mg of metoprolol tartrate + 18 mg of sodium chloride
(2) 5 ml : 5 mg of metoprolol tartrate + 45 mg of sodium chloride

Storage Preserve in tightly closed containers, protected from light.

Metoprolol Tartrate Sustained-release Tablets

Metoprolol Tartrate Sustained-release Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$.

Description White tablets or film coated tablets with white or almost white core.

Identification (1) Shake a quantity of powdered tablets, equivalent to about 0.3 g of metoprolol tartrate, with 10 ml of water to dissolve metoprolol tartrate, filter. Transfer the filtrate in a clean test tube, add an excess of silver nitrate TS, a white precipitate is produced. Add a sufficient amount of ammonia TS to dissolve the precipitate. Heat on a water bath, silver is deposited on the inner wall of the test tube as a mirror.

(2) To a quantity of the powdered tablets, add water to produce a solution of about 20 µg per ml and filter. The light absorption of the filtrate exhibits maxima at 223 nm and 274 nm (Appendix IV A).

Drug Release Carry out the method for dissolution test (Appendix X D, method 1 and Appendix X C, method 2), using 900 ml of water as the release medium and adjust the rotational speed of the paddle to 50 rpm. Withdraw a sample of 10 ml of the solution at exact 1, 4 and 8 hours respectively, filter and supply 10 ml of water accordingly in the vessel immediately. Measure the absorbance of the filtrate at 274 nm (Appendix IV A); dissolve an accurately weighed quantity of metoprolol tartrate CRS in water to produce a solution of 0.1 mg per ml, repeat the operation. Calculate the content of $(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ dissolved from each tablet at 1, 4 and 8 hours separately. The dissolution of metoprolol tartrate complies with the requirement; the quantity dissolved of each tablet is not less than 25%-45%, 40%-75% and over 75% of the labelled amount of $(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ at 1, 4 and 8 hours respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets with film coating removed. Weigh accurately a quantity of the powder equivalent to about 0.3 g of metoprolol tartrate into a 200 ml volumetric flask, add a quantity of water to dissolve

metoprolol tartrate, dilute with water to volume and shake thoroughly. Filter and transfer 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 274 nm (Appendix IV A). Dissolve an accurately weighed quantity of metoprolol tartrate CRS in water to produce a solution of 0.15 mg per ml, measure the absorbance in the same manner. Calculate the content of $(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$.

Category As described under Metoprolol Tartrate.

Strength (1) 100 mg (2) 150 mg

Storage Preserve in tightly closed containers.

Metoprolol Tartrate Tablets

Metoprolol Tartrate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of metoprolol tartrate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$.

Description White tablets.

Identification (1) To a quantity of the powdered tablets, equivalent to 0.3 g of metoprolol tartrate, add 10 ml of water, shake to dissolve metoprolol tartrate. Filter. The filtrate complies with test (1) for Identification described under Metoprolol Tartrate.

(2) The light absorption of a solution obtained in the Assay exhibits a maximum at 274 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml (for strength 100 mg) or 500 ml (for strength 25 mg, for strength 50 mg) of sodium chloride solution in hydrochloric acid (add 7 ml of hydrochloric acid to 2 g of sodium chloride, dilute with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Measure the absorbance of the successive filtrate at 274 nm (Appendix IV A). Dissolve an accurately weighed quantity of Metoprolol Tartrate CRS in the dissolution medium to produce a solution of 100 µg per ml, repeat the operation. Calculate the dissolution of $(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.12 g of metoprolol tartrate into a 100 ml volumetric flask, add a quantity of 2% sodium chloride solution, shake to dissolve metoprolol tartrate, dilute with water to volume and mix well. Filter. Measure accurately 5 ml of the successive filtrate into a 50 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 274 nm (Appendix IV A). Dissolve a quantity of metoprolol tartrate CRS in water to produce a solution of about 0.12 mg per ml, measure the absorbance in the same manner. Calculate the content of $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6]$.

Category β-Adrenergic blocker.

Strength (1) 25 mg (2) 50 mg (3) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Metronidazole

$C_6H_9N_3O_3$ 171.16

[443-48-1]

Metronidazole is 2-methyl-5-nitroimidazole-1-ethanol. It contains not less than 99.0% of $C_6H_9N_3O_3$, calculated on the dried basis.

Description A white or slightly yellow crystalline powder or crystal; odour, slight; taste, bitter and slightly saline. Sparingly soluble in ethanol; slightly soluble in water or chloroform; very slightly soluble in ether.

Melting range 159-163°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of about 13 µg per ml in hydrochloric acid solution (9→1000) at 277 nm (Appendix IV A), the value of A (1%, 1 cm) is 365-389.

Identification (1) To about 10 mg add 2 ml of sodium hydroxide TS and warm, a violet-red colour is produced; acidify the solution with dilute hydrochloric acid, the colour changes to yellow; add dropwise an excess of sodium hydroxide TS, the solution becomes orange-red.

(2) About 0.1 g should be soluble in 4 ml of sulfuric acid solution (3→100). Add 10 ml of trinitrophenol TS to the solution, a yellow precipitate is produced on standing.

(3) The light absorption of a solution obtained in the measurement of specific absorbance, exhibits a maximum at 277 nm and a minimum at 241 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of metronidazole (Appendix XVI).

2-Methyl-5-nitroimidazole Dissolve about 100 mg, weighed accurately, in methanol and dilute to 100 ml, mix well. Measure accurately a quantity, dilute with the mobile phase to produce a solution of 0.1 mg per ml as the test solution; Dissolve about 25 mg of 2-Methyl-5-nitroimidazole CRS, weighed accurately, in methanol and dilute to 100 ml, mix well. Measure accurately a quantity, dilute with the mobile phase to produce a solution of 1 µg per ml as the reference solution. Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (20 : 80) as the mobile phase. Detection wavelength is 300 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of metronidazole. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-30% of the full scale of the chart. Inject separately 20 µl of the test solution and the reference solution into the column, and record the chromatogram for two times the retention time of the principal peak. The peak area of 2-Methyl-5-nitroimidazole in the test solution is not greater than 1.0%.

Clarity and colour of ethanol solution A solution of 5 mg per ml in ethanol is clear; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A).

Loss on drying When dried to constant weight at 105°C,

loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1%, using 1.0 g (Appendix VII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.001%.

Assay Dissolve about 0.13 g, accurately weighed, in 10 ml of glacial acetic acid, add 2 drops of naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 17.12 mg of $C_6H_9N_3O_3$.

Category Anti-trichomonacide and anti-anaerobic bacteria agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Metronidazole and Glucose Injection
(2) Metronidazole Capsules
(3) Metronidazole Injection
(4) Metronidazole Suppositories
(5) Metronidazole Tablets
(6) Metronidazole Vaginal Effervescent Tablets

Metronidazole Capsules

Metronidazole Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Metronidazole ($C_6H_9N_3O_3$).

Description Capsules containing white or pale yellow crystalline powder.

Identification (1) To a quantity of the contents equivalent to about 10 mg of Metronidazole, add 2 ml of sodium hydroxide TS, gently warm the solution; a purplish red colour is produced. Add dilute hydrochloric acid dropwisely to acidify the solution; the colour changes to yellow which changes to orange-red on addition of excessive sodium hydroxide TS.

(2) Shake a quantity of the contents equivalent to about 0.1 g of Metronidazole with 4 ml of 0.5mol/L sulfuric acid solution and filter. To the filtrate add 10 ml of trinitrophenol TS and allow to stand; a yellow precipitate is produced.

(3) The light absorption of the solution described under the Assay exhibits a maximum at 277 nm and a minimum at 241 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To an accurately weighed quantity of the mixed contents in the test for Weight variation, equivalent to about 50 mg of Metronidazole, carry out the Assay described under Metronidazole Tablets beginning at the words "in a 100 ml volumetric flask. . ." Calculate the content of $C_6H_9N_3O_3$.

Category As described under Metronidazole.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Metronidazole Injection

Metronidazole Injection is a sterile solution of Metronidazole in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$). It is an isotonic solution containing sodium chloride.

Description A clear, colourless or almost colourless liquid.

Identification (1) Complies with test (1) for Identification described under Metronidazole, using a quantity equivalent to 10 mg of metronidazole.

(2) Evaporate a quantity equivalent to 0.1 g of metronidazole on a water bath to dryness, the residue complies with Identification test (2) described under Metronidazole.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 277 nm and a minimum at 241 nm (Appendix IV A).

(4) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 4.5-7.0 (Appendix VI H).

2-Methyl-5-nitroimidazole Dilute a quantity with water to produce a solution containing 0.1 mg of metronidazole per ml as the test solution, complies with test of 2-Methyl-5-nitroimidazole described under Metronidazole.

Chloride Measured accurately a quantity equivalent to about 50 mg, add 50 ml of water, 5 ml of 2% of dextrin solution, 0.1 g of calcium carbonate and 5-8 drops of fluorescein IS, mix well. Titrate with silver nitrate (0.1 mol/L) VS until the colour of the turbid solution changes from yellowish-green to slightly red; not less than 13.2 ml and not more than 14.6 ml or not less than 35.1 ml and not more than 38.8 ml (for strength 250 ml : 500 ml) are required.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.35 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), use clostridium sporogenes suspension as positive control.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Dilute an accurately measured quantity with hydrochloric acid solution (9→1000) to produce a solution containing about 12.5 µg of metronidazole per ml. Measure the absorbance at 277 nm (Appendix IV A) and calculate the content of $C_6H_9N_3O_3$, taking 377 as the value of A (1%, 1 cm).

Category As described under Metronidazole.

Strength (1) 10 ml : 50 mg (2) 20 ml : 100 mg
(3) 100 ml : 500 mg (4) 250 ml : 1.25 g
(5) 250 ml : 500 ml

Storage Preserve in well closed containers, protected from light.

Metronidazole Suppositories

Metronidazole Suppositories contain not less than 93.0% and not more than 107.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$).

Description Creamy white to pale yellow liposoluble

suppositories.

Identification Melt 1 suppository with 20 ml of ethanol by heating on a water bath, allow to cool until the mass just sets and filter. Evaporate the filtrate on a water bath to dryness, the residue complies with test (1)(2) and (3) for Identification described under Metronidazole.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Weigh accurately 10 suppositories, cut in chips. Melt a quantity equivalent to about 0.1 g of metronidazole, accurately weighed, with 20 ml of acetic anhydride on a water bath with shake, allow to cool, add 2 drops of malachite green IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 17.12 mg of $C_6H_9N_3O_3$.

Category As described under Metronidazole.

Strength (1) 0.5 g (2) 1 g

Storage Preserve in tightly closed containers, protected from light and stored at a temperature below 30°C.

Metronidazole Tablets

Metronidazole Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$).

Description White or almost white tablets.

Identification (1) Comply with test (1) for Identification described under Metronidazole, using a quantity of the powdered tablets equivalent to about 10 mg of metronidazole.

(2) To a quantity of the powdered tablets equivalent to about 0.2 g of metronidazole add 4 ml of sulfuric acid solution (3→100), shake well and filter. To the filtrate add 10 ml of trinitrophenol TS; a yellow precipitate is produced on standing.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 277 nm and a minimum at 241 nm (Appendix IV A).

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9→1000) to 50 ml and mix well. Measure the absorbance at 277 nm (Appendix IV A), calculate the dissolution of $C_6H_9N_3O_3$ from each tablet, taking 377 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 50 mg of metronidazole in a 100 ml volumetric flask add about 80 ml of hydrochloric acid solution (9→1000) and warm to dissolve metronidazole, add hydrochloric acid solution (9→1000) to volume and mix well. Filter, measure accurately 5 ml of the successive filtrate to a 200 ml volumetric flask, add hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance of the resulting solution at 277

nm (Appendix IV A) and calculate the content of $C_6H_9N_3O_3$, taking 377 as the value of A (1%, 1 cm).

Category As described under Metronidazole.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Metronidazole Vaginal Effervescent Tablets

Metronidazole Vaginal Effervescent Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$).

Description White or almost white tablets, with faintly visible spots on the surface of the tablets.

Identification A quantity of powdered tablets complies with tests for Identification described under Metronidazole Tablets.

Acidity Triturate 5 tablets and dissolve in 50 ml of water: pH 4.0-5.5 (Appendix VI H).

Effervescence Add 2 ml each of water, accurately measured, to ten 25 ml graduated test tubes with stopper (the internal diameter is about 1.5 cm) separately, place in a water bath at $37^\circ\text{C} \pm 1^\circ\text{C}$ for 5 minutes. Add 1 tablet each to the ten test tubes, stopper the test tubes for 20 minutes. The maximum volume of effervescence is not greater than 10.0 ml, and not more than 2 tablets lower than 6.0 ml.

Other requirements Comply with the general requirements for tablets except disintegration test (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Shake well an accurately weighed powder equivalent to about 50 mg of metronidazole in a 200 ml volumetric flask with 180 ml of hydrochloric acid solution (9→1000), dilute to volume and mix well, filter, measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance of the solution at 277 nm (Appendix IV A). Calculate the content of $C_6H_9N_3O_3$, taking 377 as the value of A (1%, 1 cm).

Category As described under Metronidazole.

Strength 0.2 g

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Metronidazole and Glucose Injection

Metronidazole and Glucose Injection is a sterile solution of Metronidazole and Glucose in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$) and glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless or pale yellow liquid.

Identification (1) Heat and evaporate 50 ml to about 8 ml, cool, allow to stand until crystals are formed in refrigerator. Filter, wash the crystals with a little water for 3 times. Transfer to a small beaker, the residue complies with test (1) for Identification described under Metronidazole.

(2) Heat and evaporate 50 ml to about 8 ml, cool, allow to stand until crystals are formed in refrigerator. Filter, wash the crystals with a little water for 3 times. Transfer to a small beaker, evaporate to dryness. The residue complies with test (2) for Identification described under Metronidazole.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 277 nm and a minimum at 241 nm (Appendix IV A).

(4) Add dropwise 5 ml of the injection to hot alkaline cupric tartrate TS, a red precipitate of cuprous oxide is produced.

pH value 4.5-6.0 (Appendix VI H).

2-Methyl-5-nitroimidazole Dilute a quantity with water to produce a solution containing 0.1 mg of metronidazole per ml as the test solution, complies with test of 2-Methyl-5-nitroimidazole described under Metronidazole.

Heavy metals Measure a quantity equivalent to about 3 g of glucose, evaporate to about 20 ml on a water bath, allow to cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.5 EU per ml.

Sterility Complies with the test for sterility (Appendix XI, H), treat as described under the Membrane filtration method, using clostridium sporogenes bacterial suspension as the control.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Metronidazole To a quantity of the injection, accurately measured, add hydrochloric acid solution (9→1000) to produce a solution of 10 µg per ml, measure the absorbance at 277 nm (Appendix IV A). Calculate the content of $C_6H_9N_3O_3$, taking 377 as the value of A (1%, 1 cm).

Glucose Carry out the determination of optical rotation (Appendix VI E). The observed rotation in degree multiplied by 2.0852 represents the weight in g of $C_6H_{12}O_6 \cdot H_2O$ of the testing volume.

Category As described under Metronidazole.

Strength 250 ml : 0.5 g of metronidazole and 12.5 g of glucose

Storage Preserve in well closed containers, protected from light.

Metronidazole, Clotrimazole and Chlohexidine Acetate Suppositories

Metronidazole, Clotrimazole and Chlohexidine Acetate Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of metronidazole ($C_6H_9N_3O_3$) and clotrimazole ($C_{22}H_{17}ClN_2$); Contain not less than 85.0% and not more than 115.0% of the labelled amount of chlohexidine acetate ($C_{22}H_{30}Cl_2N_{10} \cdot 2 C_2H_4O_2$).

Formula	Metronidazole	200 g
	Clotrimazole	160 g
	Chlohexidine Acetate	8 g
	Lanolin	sufficient quantity
	Parafin wax	sufficient quantity
	Semi-synthesized fatty	

glyceride (type 38)

sufficient quantity

to make

suppositories

Description Cream yellow suppositories.

Identification (1) To a quantity of the suppositories equivalent to about 0.1 g of Metronidazole add 8 ml of sodium hydroxide TS and warm, a violet-red colour is produced. Cool the solution to room temperature, extract with 8 ml of ethyl ether, shake and separate the water layer, acidify with dilute hydrochloric acid TS, a yellow colour is produced, an orange-red colour appears on adding excess sodium hydroxide.

(2) To the ethyl ether layer obtained in the test for Identification (1) add 5 ml of 1% cetyl-trimethyl-ammonium bromide solution, 1 ml of bromide TS and 1 ml of sodium hydroxide TS, shake and allow to stand, a red colour is produced in the water layer.

(3) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and xylene-propanol-concentrated ammonia solution (180 : 20 : 1) as the mobile phase. Apply separately to the plate 10 ml each of two solutions in chloroform containing (1) 2 mg per ml of Clotrimazole CRS, (2) a quantity of suppositories being examined equivalent to about 2 mg of Clotrimazole per ml. After developing and removal of the plate, dry it in air and view with iodine vapour. The principal spot in the chromatography obtained with the solution (2) is identical in colour and position to that in the chromatography obtained with solution (1).

Other requirement Comply with the general requirements for suppositories (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of methanol-water-triethylamine (70 : 30 : 0.3) (containing 10 mmol/L heptane sodium sulfonate and adjust pH to 4.0 by phosphoric acid) as the mobile phase. Detection Wavelength is 260 nm. The number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of clotrimazole and the resolution factor between the peaks of metronidazole, clotrimazole and chlorhexidine should comply with the related requirements.

Procedure Take 10 suppositories, weighed accurately, to a beaker, warm on a 70-80°C water bath to melt, mix well and cool to room temperature. Transfer a quantity of the melted suppositories, weighed accurately, equivalent to about 20 mg of metronidazole into a 100 ml volumetric flask, add a quantity of mobile phase, shake on a 70-80°C water bath to dissolve the suppositories, then cool to room temperature, dilute with mobile phase to volume, mix well. Cool for 2 hours in a ice bath, then filter immediately, put the successive filtrate to room temperature as the test solution. Inject 20 µl of solution (1) into the column and record the chromatogram. Dissolve a quantity of metronidazole, clotrimazole and chlorhexidine acetate CRS in mobile phase to produce a solution of containing 200 µg of metronidazole, 160 µg of clotrimazole and 8 µg of chlorhexidine acetate per ml. Repeat the operations instead of the substance being examined, calculate the content of $C_6H_9N_3O_2$, $C_{22}H_{17}ClN_2$ and $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibacterial agent.

Storage Preserve in tightly closed containers, protected from light, stored below 30°C.

Mexiletine Hydrochloride

 $C_{11}H_{17}NO \cdot HCl$ 215.72

[5370-01-4]

Mexiletine Hydrochloride is 1-(2,6-dimethylphenoxy)-2-propanamine hydrochloride. It contains not less than 98.5% of $C_{11}H_{17}NO \cdot HCl$, calculated on the dried basis.

Description A white or almost white, crystalline powder; almost odourless; taste, bitter.

Freely soluble in water or ethanol; practically insoluble in ether.

Melting range 200-204°C (Appendix VI C).

Identification (1) Dissolve 0.1 g in 2 ml of water, add 2 drops of iodine TS, a brownish-red precipitate is produced.

(2) The light absorption of a 0.40 mg per ml solution in water exhibits a maximum at 261 nm; the absorbance is 0.44-0.48 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mexiletine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 10 ml of water, pH 4.0-5.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.5 g in 10 ml of water is clear and colourless; any colour produced is not more intense than that of reference solution Y₃, (Appendix IX A, method 1).

2,6-Dimethylphenol Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-concentrated ammonia TS (85 : 14 : 1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 50 mg of the substance being examined per ml, (2) 0.1 mg of 2,6-dimethylphenol CRS per ml. After developing, dry it in air and spray with 0.1% Fast Blue BB salt in methanol solution, heat at 90°C for 10 minutes and spray with 3 mol/L solution of potassium hydroxide. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 2.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay. Dissolve about 0.16 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.57 mg of $C_{11}H_{17}NO \cdot HCl$.

Category Antiarrhythmic.

Storage Preserve in tightly closed containers.

Preparation (1) Mexiletine Hydrochloride Capsules
(2) Mexiletine Hydrochloride Injection
(3) Mexiletine Hydrochloride Tablets

Mexiletine Hydrochloride Capsules

Mexiletine Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Mexiletine Hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Description Capsules containing white powder.

Identification (1) Shake a quantity of the contents equivalent to about 0.25 g of Mexiletine Hydrochloride with 5 ml of water and filter. The filtrate complies with the following tests.

(i) To 1 ml of the filtrate, add 2 drops of iodine TS; a brownish-red precipitate is produced.

(ii) To 1 ml of the filtrate, add 2 drops of 0.01 mol/L sodium tetraphenylboron solution; a white turbidity is produced.

(iii) Yields the reactions characteristic of chlorides (Appendix III).

(2) Shake a quantity of the contents with water to produce a solution containing 0.4 mg of Mexiletine Hydrochloride per ml and filter. The light absorption of the filtrate exhibits a maximum at 261 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents in the test for Weight variation, equivalent to about 0.16 g of Mexiletine Hydrochloride, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and a drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.57 mg of $C_{11}H_{17}NO \cdot HCl$.

Category Antiarrhythmic agent.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Mexiletine Hydrochloride Injection

Mexiletine Hydrochloride Injection is sterile solution of Mexiletine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of mexiletine hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To 1 ml add 2 drops of iodine TS, a brownish-red precipitate is produced.

(2) To 1 ml add 2 drops of 0.01 mol/L sodium tetraphenylborate, a white turbidity is produced.

(3) Dilute a quantity of the injection with water to produce a solution of 0.4 mg per ml, the solution complies with test

(2) for Identification described under Mexiletine Hydrochloride.

(4) The aqueous solution yields the reactions characteristic

of chlorides (Appendix III).

pH value 4.5-6.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (85 : 14 : 1) as the mobile phase. Apply separately to plate 10 μ l each of the following solutions. Add 16 ml of methanol to a quantity of the injection equivalent to 0.1 g of mexiletine hydrochloride, mix well, evaporate to dryness and dissolve the residue in methanol to produce a solution of 50 mg per ml as solution (1). Dilute an accurately measured quantity of solution (1) with methanol to produce a solution of 0.25 mg per ml as solution (2). After developing and removal of the plate, dry in air, spray with ninhydrin TS and heat at 105°C for 15 minutes. Any spot, other than the principal spot, in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

2,6-Dimethylphenol Comply with the test for 2,6-Dimethylphenol described under Mexiletine Hydrochloride, using the solution prepared under test for Related substances.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 2 ml to a 200 ml volumetric flask, dilute with (0.01 mol/L) hydrochloric acid solution to volume, mix well. Measure the absorbance at 261 nm (Appendix IV A). Dissolve an accurately weighed quantity of mexiletine hydrochloride CRS in 0.01 mol/L hydrochloric acid solution to produce a solution of about 0.5 mg per ml. Measure the absorbance in the same manner, calculate the content of $C_{11}H_{17}NO \cdot HCl$ accordingly.

Category As described under Mexiletine Hydrochloride.

Strength 2 ml : 100 mg

Storage Preserve in well closed containers, stored in a cool and dark place.

Mexiletine Hydrochloride Tablets

Mexiletine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of Mexiletine Hydrochloride ($C_{11}H_{17}NO \cdot HCl$).

Description White tablets.

Identification (1) To a quantity of the powder equivalent to about 0.5 g of mexiletine hydrochloride add 10 ml of water, stir well and filter. The filtrate complies with tests (1) and (4) for Identification described under Mexiletine Hydrochloride. (2) Dissolve a quantity in water to produce a solution containing 0.4 mg of mexiletine hydrochloride per ml, filter. The light absorption of this solution exhibits a maximum at 261 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. To a quantity of the powder equivalent to about 0.6 g of mexiletine hydrochloride, accurately weighed, in a 100 ml volumetric flask add 25 ml of water, shake thoroughly, dilute with water to volume, mix well and filter. Measure accurately 25 ml of the successive filtrate, evaporate to dryness on a water bath. Dry the residue at 105°C, complete the Assay described under Mexiletine Hydrochloride, beginning at the words "in 20 ml of glacial

acetic acid, add 5 ml of mercuric acetate TS. . .". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.57 mg of $C_{11}H_{17}NO \cdot HCl$.

Category, Storage As described under Mexiletine Hydrochloride.

Strength (1) 50 mg (2) 100 mg

Miconazole Nitrate

$C_{18}H_{14}Cl_4N_2O \cdot HNO_3$ 479.15

[22832-87-7]

Miconazole Nitrate is 1-[2,4-dichloro-β (2,4-dichlorobenzoyloxy) phenethyl] imidazole Nitrate. It contains not less than 98.5% and not more than 101.5% of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$, calculated on dried basis.

Description White or almost white crystals or crystalline powder, odourless or almost odourless. Sparingly soluble in methanol, slightly soluble in ethanol or chloroform, insoluble in ether or water.

Melting range 178-184°C with decomposition.

Identification (1) To 3 mg add one drop of diphenylamine TS, a deep blue colour develops.

(2) The light absorption of the solution of about 0.4 mg per ml in a mixture of methanol and 0.1 mol/L hydrochloric acid solution (9 : 1) exhibits three maxima at 264 nm, 272 nm and 280 nm, respectively.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of miconazole nitrate (Appendix XVI).

(4) Carry out the oxygen flask combustion (Appendix VII C), using about 20 mg, and 5 ml of 0.5% sodium hydroxide solution as absorbing solution. Shake thoroughly, to the resulting solution add 15 ml of water and acidify with dilute nitric acid. The solution yields reactions characteristic of chloride (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B) using silica gel G as the coating substance and a mixture of hexane-chloroform and methanol (54 : 28 : 18) as the mobile phase. Apply separately to the plate 50 μl of each of two solutions of the substance being examined in chloroform and methanol (1 : 1) containing (1) 10 mg and (2) 25 μg per ml, respectively. Place a beaker with 5 ml of concentrated ammonia solution in chromatographic chamber. After developing and removal of the plate, allow it to dry in air and expose the plate to iodine vapour. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2).

Loss on drying Dry it at 105°C to constant weight, loses not more than 0.5% (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve 0.25 g accurately weighed in 35 ml of a mixture of equal volume of glacial acetic acid and acetic anhydride. Carry out the method for potentiometric titration (Appendix VII A). Titrate with perchloric acid (0.1 mol/L)

VS. Perform a blank determination and make any necessary correction. Each ml of 0.1 mol/L of perchloric acid is equivalent to 47.92 mg of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$.

Category Antifungal.

Storage Preserve in tightly close container.

Preparations (1) Miconazol Nitrate Capsules
(2) Miconazol Nitrate Cream
(3) Miconazol Nitrate Liniment

Miconazol Nitrate Capsules

Miconazol Nitrate Capsules contains not less than 90.0% and not more than 110.0% of labelled quantity of miconazol nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

Description Capsules containing white or almost white crystalline powder; odourless or almost odourless.

Identification (1) To a small quantity add a drop of diphenylamine solution (to 0.1 g add the mixture of 10 ml of sulfuric acid and 2 ml of water, cool), a deep blue develops. (2) The light absorption of the solution of 0.4 mg per ml in methanol and hydrochloric acid solution 0.1 mol/L exhibits three maxima at 264 nm, 272 nm and 280 nm, respectively, with corresponding absorbances of 0.40, 0.54 and 0.44.

(3) Carry out the method of oxygen flask combustion (Appendix VII C) using 5 ml of 5% sodium hydroxide as the absorption solution. When the combustion is complete. To the result solution add 15 ml of water, it yields a reaction characteristic of chloride (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-0.5% ammonium acetate solution (42.5 : 42.5 : 15) as the mobile phase. Detection Wavelength is 230 nm. The number of the theoretical plates of the column is generally 7000, calculated with reference to the peak of miconazole nitrate.

Procedure Transfer an accurately weighed quantity of mixed contents from test for weight variation of content, be equivalent to about 0.25 g of miconazole nitrate, to a 100 ml volumetric flask, add methanol to dissolve miconazole nitrate and dilute to volume, mix well and filter. Measure accurately 2 ml of the successive filtrate to a 10 ml volumetric flask and dilute with methanol to volume, mix well as the test solution. Inject 20 μl of the test solution into the column and record the chromatogram. Dissolve a quantity of miconazole nitrate CRS, weighed accurately, with methanol to produce a solution of about 0.5 mg per ml as the reference solution. Repeat the operations instead of the test solution, calculate the content of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under miconazol nitrate.

Strength 0.25 g

Storage Preserve in tightly closed container and protected from light.

Miconazole Nitrate Cream

Miconazole Nitrate Cream contains not less than 90.0% and not more than 110.0% of labelled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

Description A white or almost white cream.

Identification Carry out the method for thin-layer chromatography as described under relative substance of miconazol nitrate (Appendix V B). Apply separately to the same plate 10 μ l of each of the following solution. Solution (1) is the supernatant liquid centrifuged with the solution of substance being examined (equivalent to about 40 mg of miconazol nitrate) dissolved in 10 ml of anhydrous ethanol by heating on water bath and cool. Solution (2) is solution of 10 mg of miconazole nitrate CRS in 10 ml of anhydrous ethanol. The position and colour of the principle spot obtained from the solution (1) corresponds to that obtained from solution (2).

Other requirement Complies with the general requirement for creams (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.5% ammonium acetate solution-acetonitrile-methanol (15 : 42.5 : 42.5) as the mobile phase. Detection wavelength is 230 nm. The resolution factor between the peaks of miconazol nitrate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of dibutyl phthalate with a mixture of methanol-chloroform (1 : 1) to produce a solution of about 1.6 mg per ml.

Procedure Transfer about 2.5 g of accurately weighed cream to a 50 ml volumetric flask, add 25 ml of internal standard solution, dilute to volume with a mixture of methanol-chloroform (1 : 1) and mix well, filter. Inject 10 μ l of the successive filtrate into the column. Repeat the operation, using miconazole nitrate CRS instead of the substance being examined, calculate the content of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$.

Category As described under miconazol nitrate.

Strength 2%

Storage Preserve in tightly closed container.

Miconazole Nitrate Liniment

Miconazole Nitrate Liniment contains not less than 90.0% and not more than 110.0% of labelled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

Description A clear, colourless to slight yellow liquid.

Identification The retention time of the principal peak in the chromatogram of the test preparation obtained under the Assay is identical with that of the principal peak in the chromatogram of the reference preparation.

Other requirements Complies with the requirements for Liniments (Appendix I T).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-0.5% ammonium acetate solution

(42.5 : 42.5 : 15) as the mobile phase. Detection wavelength is 230 nm and the number of the theoretical plates of the column is generally 7000, calculated with reference to the peak of miconazole nitrate.

Procedure Transfer accurately 2 ml of the liniment, equivalent to 40 mg of miconazole nitrate, into a 100 ml volumetric flask, dilute to volume with methanol and mix well, as test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Repeat the operation, using a reference solution containing 0.4 mg of miconazole nitrate CRS per ml in methanol instead of the test solution. Calculate the content of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Miconazole Nitrate.

Strength 2%

Storage Preserve in tightly closed containers, protected from light.

Micronomicin Sulfate

$(C_{20}H_{41}N_5O_7)_2 \cdot 5H_2SO_4$ 1417.52

Micronomicin sulfate is O-3-amino-2,3,4,6-tetradeoxy-6-methylamino- α -D-erythro-hexopyranosyl-(1 \rightarrow 4)-O-[3-deoxyl-4-C-methyl-3-methylamino- β -L-arabinopyranosyl-(1 \rightarrow 6)]-2-deoxyl-D-streptamine hemihydrate sulfate. It has a potency of not less than 590 micronomicin Units per mg, calculated on the anhydrous basis.

Description A white or almost white powder; odourless; hygroscopic; freely soluble in water, practically insoluble in methanol, ethanol, acetone, ethyl acetate or chloroform.

Specific optical rotation +110° to +130° (Appendix VI E), in a solution of 10 mg per ml in water.

Identification (1) To about 5 mg, add water to dissolve, then mix with 1 ml of 0.1% ninhydrin in n-butanol saturated with water and 0.5 ml of pyridine, heat on a water bath for a few minutes. A violet colour is produced immediately.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and the lower layer of a mixture of chloroform-methanol-ammonia (4 : 3 : 2) as the mobile phase. Apply separately to the plate 5 μ l each of the two solutions in water containing (1) 5 mg per ml of the substance being examined and (2) 5 mg per ml of micronomicin CRS. After developing and removal of the plate, allow to dry at 20-25°C and expose it to iodine vapor. The position and colour of the principal spot in the chromatogram obtained with solution (1) correspond to

that of the principal spot obtained with solution (2).

(3) The retention time of the principal peak in the test solution in the chromatogram obtained in the Purity is identical with that of the principal peak of micronomicin CRS in the chromatogram of the reference solution correspondingly.

(4) The aqueous solution yields the reaction characteristic of sulfate (Appendix III).

Test (2) and (3) are alternative.

Acidity An aqueous solution of 50 mg per ml, pH 4.0-6.5 (Appendix VI H).

Clarity and colour of solution Dissolve 1.0 g each of 5 portions in 10 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not intense than that of reference solution Y₂ or YG₂ (Appendix IX A method 1) for injection.

Sulphate Dissolve about 0.125 g, accurately weighed, in 100 ml of distilled water, adjust the pH value of the solution to 11 with concentrated ammonia solution. Add accurately 10 ml of 0.1 mol/L barium chloride VS and five drops of phthalein purple IS. Titrate with 0.05 mol/L disodium edetate VS (Notice: keep the pH value at 11 during the titration), adding 50 ml of alcohol when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride VS (0.1 mol/L) is equivalent to 9.606 mg of SO₄; not less than 32.0% and not more than 37.0%, calculated on the anhydrous basis.

Water Not more than 12.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 0.5 EU per 1000 micronomicin Units (for injection).

Purity Carry out the method for high-performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (pH adaptive value is 0.8-8.0) and a mixture of 0.2 mol/L trifluoroacetic acid-methanol (94 : 6) as the mobile phase. The flow rate is 0.6 ml per minute. The drift tube temperature of evaporative light-scattering detector (ELSD) is 110°C, the flow rate of the carrier gas is 2.8 L per minute and Impactor is off (these parameters can be adjusted if necessary). Dissolve an amount of gentamycin C_{1a} CRS and micronomicin CRS in water to obtain a solution containing 0.2 mg each of the two substances per ml. Inject 20 µl of the solution into the column. The resolution factor between the peaks of gentamycin C_{1a} and micronomicin complies with the related requirements. The relative standard deviation (RSD) for replicate 5 injections is less than 2.0%.

Procedure Dissolve an accurately weighed quantity of micronomicin CRS in water to produce solutions of 0.2, 0.5, 1.0 mg per ml respectively as reference solution (1), (2), (3). Inject 20 µl each of the three solutions into the column. Based on the corresponding concentrations (C) and areas (A) of micronomicin in reference solution (1), (2), (3), the linear regression equation of logA versus logC can be determined. The correlation coefficient (r) of the regression equation should be greater than 0.99; Dissolve an accurately weighed quantity of the substance being examined with water to produce a solution of about 0.4 mg per ml as test solution. Inject 20 µl of the solution into the column. Calculate the content of C₂₀H₄₁N₅O₇ based on the regression equation and the corresponding peak area of micronomicin in the

chromatogram of test solution. Not less than 85.0% of C₂₀H₄₁N₅O₇ of the labelled amount.

Assay Carry out the method for Microbiological Assay of Antibiotics (Appendix XI A), using a solution of 1000 Units per ml in sterile water. The confidence-limit rate is not more than 7%. 1000 micronomicin units is equivalent to 1 mg of micronomicin.

Category Aminoglycoside Antibiotics.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Micronomicin Sulfate Injection
(2) Micronomicin Sulfate Oral Solution
(3) Micronomicin Sulfate Tablets

Micronomicin Sulfate Injection

Micronomicin Sulfate Injection is a sterile solution of micronomicin sulfate in water for injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of micronomicin (C₂₀H₄₁N₅O₇).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the tests for Identification described under Micronomicin Sulfate.

pH Value pH 5.5-7.5 (Appendix VI H).

Colour of solution The solution is colourless; any colour produced is not intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Purity Transfer an accurately measured volume of the sample solution and dilute with sterile water to produce a solution of 0.4 mg of micronomicin per ml as the test solution. Carry out the Purity described under Micronomicin Sulfate. Not less than 81.0% of micronomicin of the labelled amount.

Sterility Transfer the samples to not less than 500 ml of 0.9% sterile sodium chloride solution, mix well, carry out the test for sterility (Appendix XI H, membrane filtration method).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 0.50 EU per 1000 micronomicin Units.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured volume of the sample solution with sterile water to produce a solution of 1000 Units per ml, carry out the Assay described under Micronomicin Sulfate.

Category As described under Micronomicin Sulfate.

Strength (1) 1 ml : 30 mg (30000 micronomicin Units)
(2) 2 ml : 60 mg (60000 micronomicin Units)
(3) 2 ml : 80 mg (80000 micronomicin Units)

Storage Preserve in well closed containers, stored in a cool and dark place.

Micronomicin Sulfate Oral Solution

Micronomicin Sulfate Oral Solution contains not

less than 90.0% and not more than 110.0% of the labelled amount of micronomicin ($C_{20}H_{41}N_5O_7$).

Description A clear, almost colourless to yellow liquid; sweet.

Identification Comply with the tests for Identification described under Micronomicin Sulfate.

pH Value pH 3.5-5.5 (Appendix VI H).

Purity Transfer an accurately measured volume of the sample solution and dilute with sterile water to produce a solution of 0.4 mg of micronomicin per ml as the test solution. Carry out the Purity described under Micronomicin Sulfate. Not less than 81.0% of micronomicin of the labelled amount.

Other requirements Complies with the general requirements for oral solutions (Appendix I O).

Assay Dilute an accurately measured volume of the sample solution with sterile water to produce a solution of 1000 Units per ml, carry out the Assay described under Micronomicin Sulfate.

Category As described under Micronomicin Sulfate.

Strength 10 ml : 80 mg (80000 micronomicin Units)

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Micronomicin Sulfate Tablets

Micronomicin Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of micronomicin ($C_{20}H_{41}N_5O_7$).

Description Sugar coated or film coated tablets with white to pale yellow core.

Identification To a quantity of powdered tablets, equivalent to 25 mg of micronomicin, add 5 ml of water, filter, the successive filtrate complies with the tests for Identification described under Micronomicin Sulfate.

Purity Dissolve an accurately weighed quantity of powdered tablets with sterile water and dilute to produce a solution of 0.4 mg of micronomicin per ml as the test solution. Carry out the Purity described under Micronomicin Sulfate. Not less than 81.0% of micronomicin of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Take and powder 5 tablets. Dissolve a quantity of the powdered tablets in sterile water and dilute to produce a solution of 1000 Units per ml, carry out the Assay described under Micronomicin Sulfate.

Category As described under Micronomicin Sulfate.

Strength 40 mg (40000 micronomicin Units)

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Mifepristone

$C_{29}H_{35}NO_2$ 429.61

Mifepristone is 11-β [4-(N, N-Dimethylamino)-1-phenyl]-17β-hydroxy-17α-(1-propynyl)-estra-4,9-dien-3-one. It contains not less than 98.5% of $C_{29}H_{35}NO_2$, calculated on the dried basis.

Description A pale yellow crystalline powder; odourless, tasteless. Very soluble in methanol or dichloromethane; soluble in ethanol or ethyl acetate; practically insoluble in water.

Melting point 192-196°C (Appendix VI C).

Specific optical rotation +124° to +129°, in a solution of 5 mg per ml in dichloromethane (Appendix VI E).

Identification (1) The light absorption of a solution of 10 µg per ml in ethanol exhibits maxima at 304 nm and 260 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mifepristone (Appendix XVI).

Related substances To a quantity, add methanol to produce a solution of 0.5 mg per ml as test solution. Measure accurately 2 ml of the test solution, to a 100 ml volumetric flask, dilute with methanol to volume, mix well, taking the solution as reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-triethylamine (75 : 25 : 0.05) as the mobile phase. Detection wavelength is 304 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of mifepristone. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject 10 µl each of the test solution and the reference solution into the column separately, and record the chromatogram for twice the retention time of the principal peak. The sum of the area of secondary peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying when dried to constant weight at 105°C, loses are not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 42.96 mg of $C_{29}H_{35}NO_2$.

Category Earlier period conceived terminator.

Storage Preserve in tightly closed containers, protected from light.

Preparation mifepristone tablets

Mifepristone Tablets

Mifepristone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of mifepristone ($C_{29}H_{35}NO_2$).

Description Slightly yellow tablets.

Identification A quantity of powdered tablets, equivalent to about 20 mg of mifepristone, complies with the test (1) for Identification as described under Mifepristone.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet (for strength 10 mg) to a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution, shake to dissolve mifepristone, dilute with 0.1 mol/L hydrochloric acid solution to volume and shake thoroughly, filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, measure the absorbance of the resulting solution at 310 nm (Appendix IV A). Calculate the content of $C_{29}H_{35}NO_2$, taking 463 as the value of A (1%, 1 cm).

Dissolution Carry out the test for the dissolution (Appendix X C, method 1), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw 15 ml of the solution after exact 30 minutes and filter. Dilute 10 ml of the successive filtrate, accurately measured, with dissolution medium to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 310 nm (Appendix IV A). Calculate the dissolution of $C_{29}H_{35}NO_2$ from each tablet, taking 463 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets, equivalent to about 50 mg of mifepristone, to a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution and shake to dissolve mifepristone, dilute with 0.1 mol/L hydrochloric acid solution to volume and shake thoroughly, filter. Transfer 2 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, measure the absorbance of the resulting solution at 310 nm (Appendix IV A). Calculate the content of $C_{29}H_{35}NO_2$, taking 463 as the value of A (1%, 1 cm).

Category As described under mifepristone.

Strength (1) 10 mg (2) 25 mg (3) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Minocycline Hydrochloride

$C_{23}H_{27}N_3O_7 \cdot HCl$ 493.94

Minocycline Hydrochloride is [4S-(4 α , 4a α , 5a α , 12a α)]-4,7-bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12 α -tetrahydroxy-1,11-dioxo-2-tetracyclic-carboxamide hydrochloride. It contains not less than 89.0% and not more than 95.0% of $C_{23}H_{27}N_3O_7$, calculated on the anhydrous basis.

Description A yellow crystalline powder; odourless; taste bitter; hygroscopic.

Soluble in methanol; sparingly soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of minocycline CRS in the chromatogram.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of minocycline hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chloride (Appendix III).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity An aqueous solution of 10 mg per ml, pH 3.5-4.5 (Appendix VI H).

Water 4.3%-8.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.005%.

Related substances Protect from light throughout the procedure. Carry out the method described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in water to produce solutions of 0.5 mg per ml (solution 1) and 5 µg per ml (solution 2). Inject 10 µl of solution (2) into the column, adjust the attenuation so that the principal peak height is 20%-25% of the full scale of the chart. Inject separately 10 µl each of solution (1) and (2), and record the chromatogram for 2.6 times the retention time of the principal peak. The peak area of 4-epiminocycline is not greater than 1.2 times of the principal peak area in the chromatogram obtained with solution (2) and any other peak area and the sum of the areas of all peaks other than the principal peak are not greater than 1.2 times and twice of the principal peak area in the chromatogram obtained with solution (2) respectively. (Disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).)

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.2 mol/L ammonium acetate solution-N, N-dimethylformamide-tetrahydrofuran (600 : 398 : 2, with 0.01 mol/L disodium

edetate) as the mobile phase. Detection wavelength is 280 nm. Weigh about 10 mg of minocycline hydrochloride CRS into a 25 ml volumetric flask, add 5 ml of water to dissolve minocycline, heat the solution in a water bath at 100°C for 60 minutes, cool and dilute with water to volume and mix well. Inject 10 μ l of the resulting solution into the column and record the chromatogram. The tail factor of the peak of minocycline is not less than 0.9 and not more than 1.35. The resolution factor between the peaks of minocycline and 4-epiminocycline (relative retention time is about 0.8) is not less than 2.5. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of minocycline.

Procedure Dissolve a quantity of the substance being examined, equivalent to about 50 mg of minocycline, accurately weighted, in water in a 100 ml volumetric flask and dilute to volume, mix well. Inject 10 μ l into the column and record the chromatogram. Repeat the operation, using minocycline CRS instead of the substance being examined. Calculate the content of $C_{23}H_{27}N_3O_7$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Tetracycline antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Minocycline Hydrochloride Capsules
(2) Minocycline Hydrochloride Tablets

Minocycline Hydrochloride Capsules

Minocycline Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of minocycline ($C_{23}H_{27}N_3O_7$).

Description The contents are yellow or dark yellow powder or granules.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of minocycline CRS in the chromatogram.

(2) To a quantity of the contents of capsules, equivalent to about 20 mg of minocycline, add 20 ml of water, shake to dissolve minocycline and filter. The successive filtrate yields the reactions characteristic of chloride (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of about 15 μ g per ml. Dissolve an accurately weighed quantity of minocycline hydrochloride CRS in water to produce a solution of 15 μ g per ml. Measure the absorbances of the resulting solutions at 348 nm (Appendix IV A). Calculate the dissolution of $C_{23}H_{27}N_3O_7$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Related substances Protect from light throughout the procedure. Dissolve an accurately weighed quantity of the mixed contents obtained in weight variation in water to produce solutions of 0.5 mg per ml (solution 1) and 5 μ g per ml (solution 2). Carry out the Related substances described under Minocycline Hydrochloride.

Water Not more than 12.0% (Appendix VIII M, method 1 A), using a quantity of the contents of the capsules.

Other requirements Comply with the general requirements

for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in weight variation, equivalent to about 50 mg of minocycline, into a 100 ml volumetric flask, add 80 ml of water and ultrasonic for 5 minutes to dissolve minocycline, dilute with water to volume and mix well. Filter and use the successive filtrate as the test solution. Carry out the Assay described under Minocycline Hydrochloride.

Category As described under Minocycline Hydrochloride.

Strength Calculate as $C_{23}H_{27}N_3O_7$ (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Minocycline Hydrochloride Tablets

Minocycline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of minocycline ($C_{23}H_{27}N_3O_7$).

Description Yellow tablets or sugar or film coated tablets with yellow core.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of minocycline CRS in the chromatogram.

(2) To a quantity of powdered tablets, equivalent to about 20 mg of minocycline, add 20 ml of water, shake to dissolve minocycline and filter. The successive filtrate yields the reactions characteristic of chloride (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of about 15 μ g per ml. Dissolve an accurately weighed quantity of minocycline hydrochloride CRS in water to produce a solution of 15 μ g per ml. Measure the absorbances of the resulting solutions at 348 nm (Appendix IV A). Calculate the dissolution of $C_{23}H_{27}N_3O_7$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Related substances Protect from light throughout the procedure. Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powdered tablets in water to produce solutions of 0.5 mg per ml (solution 1) and 5 μ g per ml (solution 2). Carry out the Related substances described under Minocycline Hydrochloride.

Water Not more than 12.0% (Appendix VIII M, method 1 A), using a quantity of powdered tablets.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets, equivalent to about 50 mg of minocycline, into a 100 ml volumetric flask, add 80 ml of water and ultrasonic for 5 minutes to dissolve minocycline, dilute with water to volume and mix well. Filter and use the successive filtrate as the test solution. Carry out the Assay described under Minocycline Hydrochloride.

Category As described under Minocycline Hydrochloride.

Strength Calculate as $C_{23}H_{27}N_3O_7$
(1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from

light.

Minoxidil

$C_9H_{15}N_5O$ 209.25

[38304-91-5]

Minoxidil is 2,4-diamino-6-piperidinopyrimidine 3-oxide. It contains not less than 98.0% of $C_9H_{15}N_5O$, calculated on the dried basis.

Description A white or almost white crystalline powder. Soluble in glacial acetic acid; sparingly soluble in ethanol; slightly soluble in chloroform or water; very slightly soluble in acetone.

Identification (1) The light absorption of a solution of 6 μ g per ml in ethanol exhibits a maximum at 231 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of minoxidil (Appendix XVI).

Chlorinate compound Carry out the method for oxygen flask combustion (Appendix VII C), using about 20 mg, accurately weighed, and 10 ml of sodium hydroxide (0.1 mol/L) VS as the absorbing liquid. When the combustion is complete, shake vigorously the flask for a few minutes, wash the stopper and the platinum wire with a little water, transfer the combined washings and absorbing liquid to a 50 ml Nessler cylinder quantitatively. Carry out the limit test for chlorides (Appendix VIII B), using the resulting solution. Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner using 4.0 ml of sodium chloride standard solution (0.2%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition No more than 0.15% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002 %.

Assay To about 0.2 g, accurately weighed, add 10 ml of glacial acetic acid and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.93 mg of $C_9H_{15}N_5O$.

Category Antihypertensive agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Minoxidil Tablets

Minoxidil Tablets

Minoxidil Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of

minoxidil ($C_9H_{15}N_5O$).

Description White tablets.

Identification (1) Shake a quantity of the powdered tablets, equivalent to about 5 mg of minoxidil, with 3 ml of ethanol, filter, evaporate the filtrate to dryness. To the residue add 1 ml of acetic anhydride and 10 mg of citric acid, heat in a water bath for 2 minutes, a red colour is produced gradually.

(2) The light absorption of solution obtained in the Assay exhibits two maxima at 281 nm and 229 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E). Shake 1 tablet in a 100 ml volumetric flask with a quantity of hydrochloric acid solution (9→1000) to dissolve minoxidil, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Filter, measure accurately 2 ml of the successive filtrate to a 10 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Carry out the determination as described under Assay. Calculate the content of $C_9H_{15}N_5O$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powdered tablets, equivalent to about 20 mg of, minoxidil, accurately weighed, in a 100 ml volumetric flask, add about 60 ml of hydrochloric acid solution (9→1000), shake to dissolve minoxidil, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Filter, measure accurately 2 ml of the successive filtrate to another 100 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Dissolve minoxidil CRS in hydrochloric acid solution (9→1000) to produce a solution of about 4 μ g per ml. Measure the absorbances of the resulting solutions at 281 nm (Appendix IV A). Calculate the content of $C_9H_{15}N_5O$.

Category, Storage As described under Minoxidil.

Strength 2.5 mg

Mitomycin

$C_{15}H_{18}N_4O_5$ 334.33

[50-07-7]

Mitomycin contains not less than 90.0% of $C_{15}H_{18}N_4O_5$, calculated on the dried basis.

Description A dark purple, crystalline powder, odourless, unstable when exposed to acid, alkaline or sunlight. Slightly soluble in water, methanol or ethanol, practically insoluble in ether.

Identification (1) The light absorption of a solution containing 0.01 mg per ml in water exhibits maxima at 217 nm and 365 nm (Appendix IV A).

(2) The retention time of the principal peak for the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mitomycin (Appendix XI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity or alkalinity A suspension of 5 mg per ml in water pH 5.5-7.5 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 2.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 10 EU per mg.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with benzolsilane bonded silica gel and a mixture of methanol-ammonia acetate BS (dissolve 2.05 g of ammonia acetate in water, add 6.7 ml of 0.83 mol/L acetic acid solution, dilute to 1000 ml with water) (25 : 75) as the mobile phase. Detection wavelength is 365 nm. Dissolve 5 mg of Mitomycin CRS and 75 mg of 3-ethoxycarbonyl-4-hydroxyl benzaldehyde in N,N-dimethylacetamide in a 10 ml volumetric flask and dilute to volume, mix well. Inject 5 µl into the column and record the chromatogram. The resolution factor between the peak of Mitomycin and 3-ethoxycarbonyl-4-hydroxyl benzaldehyde is not less than 1.8. The tailing factor of Mitomycin is not more than 1.3.

Procedure Dissolve an accurately weighed quantity of the substance being examined in N, N-dimethylacetamide to produce a solution of 0.2 mg of Mitomycin per ml. Inject 5 µl, accurately measured, into the column and record the peak areas obtained in the chromatogram. Repeat the operation, using mitomycin CRS instead of the substance being examined, calculate the content of $C_{15}H_{18}N_4O_5$ by the external standard method.

Category Antitumor Antibiotic.

Storage Preserve in hermetically sealed containers, stored in a cool and dark place.

Preparation Mitomycin for Injection

Mitomycin for Injection

Mitomycin for Injection is a sterile mixed powder of mitomycin and sodium chloride. It contains not less than 90.0% and not more than 110.0% of the labelled amount of mitomycin ($C_{15}H_{18}N_4O_5$), calculated on the basis of the average contents.

Description A bluish-purple powder or grey-purple lyophilized powder, unstable on exposure to light.

Identification Complies with the tests for Identification described under Mitomycin.

Acidity or alkalinity Dissolve a quantity in water to produce a solution containing 5 mg per ml, pH 5.5-7.5 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight about 0.2 g at 60°C, loses not more than 1.0%, using about 0.2 g (Appendix VIII L).

Content uniformity Carry out the method described under Assay, using 10 vials. Calculate the content of $C_{15}H_{18}N_4O_5$ in each vial and the average content of 10 vials. Not more than 1 vial of the individual content deviates from the average content by more than 15% of the content variation, and none

of the individual content deviates by more than 20% of the content variation.

Bacterial endotoxin Carry out the test described under Mitomycin.

Sterility Complies with the test for sterility (Appendix XI H, Membrane Filtration Method), dissolving content in a suitable solvent and transferring all of the solution to 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Mitomycin, using 10 vials. Determine the content of each vial and calculate the average content of 10 vials.

Category As described under Mitomycin.

Strength (1) 2 mg (2) 4 mg (3) 8 mg (4) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Mitoxantrone Hydrochloride

$C_{22}H_{28}N_4O_6 \cdot 2HCl$ 517.41

Mitoxantrone Hydrochloride is 1,4-dihydroxy-5,8-di[[2-[(2-hydroxyethyl) amino] ethyl] amino]-9,10-quinone dihydrochloride. It contains not less than 97.0% and not more than 102.0% of $C_{22}H_{28}N_4O_6 \cdot 2HCl$, calculated on the dried basis.

Description A dark blue crystalline powder; odourless; hygroscopic. Soluble in water; slightly soluble in ethanol; insoluble in chloroform.

Identification (1) Dissolve 5 mg in 1 ml of water, add 1 ml of strong sulfuric acid, a blue colour turns to violetish-red.

(2) Dissolve 2 mg in 1 ml of water, add sodium Nitrite crystalline powder and 5 drops of hydrochloric acid solution (1→2), a violet colour is produced.

(3) The light absorption of the solution obtained in Assay exhibits maxima at 242 nm, 275 nm, 609nm and 663 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of mitoxantrone hydrochloride (Appendix XVI).

(5) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.1g in 10 ml of water, pH 3.0-5.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-ammonia (17 : 3 : 0.5) as the mobile phase. Apply separately to the plate 10 µl of each of four solutions of substance being examined in ethanol containing (1) 1 mg per ml, (2) 0.01 mg per ml, (3) 0.02 mg per ml, (4) 0.03 mg per ml. After developing and removal of the plate, allow it to dry in air, and then examine. The number of the

secondary spots in the chromatogram obtained with solution (1) is not more than 3. Any secondary spot is not more intense than the principal spot obtained with solution (4). the total impurity is not more than 7%.

Loss on drying When dried to constant weight at 100°C for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve 10 mg, accurately weighed, in 1 ml of water in a 100 ml volumetric flask, dilute with dehydrated ethanol to volume and shake well, measure accurately 5 ml into a 50 ml volumetric flask, add 5 ml of 0.1 mol/L hydrochloric acid solution, dilute with dehydrated ethanol to volume and shake well. Measure the absorbance at 663 nm (Appendix IV B), calculate the content of $C_{22}H_{28}N_4O_6 \cdot 2HCl$, taking 570 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed container, protected from light.

Preparation Mitoxantrone Hydrochloride for Injection

Mitoxantrone Hydrochloride for Injection

Mitoxantrone Hydrochloride for Injection is a sterile powder of Mitoxantrone Hydrochloride. It contains not less than 90.0% and not more than 110.0% of the labelled amount of mitoxantrone hydrochloride ($C_{22}H_{28}N_4O_6$).

Description A bluish-black colour solid hygroscopic.

Identification Complies with the tests (1), (2), (3) and (5) for Identification described under Mitoxantrone Hydrochloride.

Acidity Dissolve 5 mg in 1 ml of water, pH 4.0-6.0 (Appendix VI H).

Loss on drying When dried in vacuum to constant weight at 100°C for 4 hours, loses not more than 6.0% of its weight (Appendix VIII L).

Content uniformity The content determined in the Assay complies with the requirement of content uniformity (Appendix X E).

Sterility Dissolve the contents in a quantity of sodium chloride injection, and transfer the solution to 100 ml of sodium chloride injection respectively. The resulting solutions comply with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Add 1 ml of water respectively to 10 containers, allow to dissolve, and then transfer them to 50 ml volumetric flask, respectively. Wash the containers with dehydrated ethanol several times, combine the washings to the volumetric flask and dilute to volume, shake well. Carry out the method described under Mitoxantrone Hydrochloride beginning at the words "measure accurately 5 ml". Calculate the contents of each container and the average contents of 10

containers. Each mg of mitoxantrone hydrochloride ($C_{22}H_{28}N_4O_6 \cdot 2HCl$) is equivalent to 0.8591 mg of mitoxantrone ($C_{22}H_{28}N_4O_6$).

Category As described under Mitoxantrone Hydrochloride.

Strength 5 mg (calculated on Mitoxantrone)

Storage Preserve in tightly closed container, protected from light.

Moclobemide

$C_{13}H_{17}ClN_2O_2$ 268.74

[71320-77-9]

Moclobemide is 4-chloro-*N*-[2-(4-morpholinoethyl)]benzamide. It contains not less than 99.0% of $C_{13}H_{17}ClN_2O_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; taste slightly bitter.

Freely soluble in methanol, ethanol, chloroform or glacial acetic acid; soluble in acetone; slightly soluble in water.

Melting point 136-140°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in 0.1 mol/L hydrochloric acid solution at 240 nm (Appendix IV A), the value of A (1%, 1 cm) is 557-591.

Identification (1) Dissolve about 10 mg in 5 ml of dilute hydrochloric acid and 20 ml of water, to 5 ml add 2 drops of potassium iodobismuthate TS; an orange-red precipitate is produced.

(2) The light absorption of the solution obtained in Specific absorbance exhibits a maximum at 240 nm, and a minimum at 214 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of moclobemide (Appendix XVI).

(4) Place 0.1 g in a suitable crucible, mix with 1 g of anhydrous sodium carbonate. Heat until the mixture turns to brown, then keep heating for 10 minutes. Dissolve the cooled residue in 10 ml of water and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Chloride Add 50 ml of water to 0.60 g of the substance being examined, shake for 5 minutes to dissolve and filter. Carry out the limit test for chloride (Appendix VII A), using 25 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.020%).

Sulfate Add 50 ml of water to 2.0 g of the substance being examined, treat in a ultrasonic bath for 5 minutes and filter. Carry out the limit test for sulfate (Appendix VII B), using 25 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 3.0 ml of potassium sulfate standard solution (0.030%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with cyanosilane bonded silica gel and a mixture of 0.14% triethylamine solution [adjust pH to 6.0 with phosphoric acid (1 → 2)]-methanol (6 : 1) as the

mobile phase. The detection wavelength is 235 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of moclobemide. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce solutions of 1.5 mg per ml (solution 1) and 15 µg per ml (solution 2). Inject 20 µl of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 25% of full scale of the chart. And then inject separately 20 µl each of solution (1) and (2) into the column, and record the chromatogram for 2.5 times of the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) are not greater than 1/2 the area and the area of the principal peak in the chromatogram obtained with solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Arsenic Mix well 1.0 g with 1 g of calcium hydroxide and a small amount of water, stir and dry. Heat gently to carbonize, then ignite at 500-600°C until free from carbon. Dissolve the cooled residue in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.87 mg of $C_{13}H_{17}ClN_2O_2$.

Category Antidepressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Moclobemide Capsules
(2) Moclobemide Tablets

Moclobemide Capsules

Moclobemide Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of moclobemide ($C_{13}H_{17}ClN_2O_2$).

Description Content white or almost white powder.

Identification (1) Dissolve a quantity of the contents of the capsules, equivalent to about 50 mg of moclobemide, in 25 ml volumetric flask in ethanol by shaking, dilute to volume and mix well. Filter and use the successive filtrate as test solution. Prepare a reference solution by dissolving a quantity of moclobemide CRS in ethanol to produce a solution of 2 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-ethanol-concentrated ammonia solution (8 : 2 : 1) as the mobile phase. Apply separately to the plate 15 µl each of above two solutions, after developing and removal of the plate, dry in air and examine under ultra-violet light at 254 nm. The position and colour of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 240 nm, and a minimum at 214 nm (Appendix IV A).

(3) Place a quantity of the contents of capsules, equivalent to about 0.1 g of moclobemide, in a suitable crucible, mix with 1 g of anhydrous sodium carbonate. Heat until it is thoroughly charred, then keep heating for 10 minutes. Dissolve the cooled residue in 5 ml of water and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Dissolution Carry out the method for dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle at 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes, filter. Measure accurately a quantity of the successive filtrate, dilute with 0.1 mol/L hydrochloric acid solution to produce a solution of 10 µg per ml. Carry out the procedure as described under Assay, beginning at the words "Dissolve a quantity of moclobemide CRS". Calculate the dissolution of $C_{13}H_{17}ClN_2O_2$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents of capsules, equivalent to about 20 mg of moclobemide, into a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution and shake to dissolve, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, filter. Dilute 5 ml of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to 100 ml, mix well as the test solution. Dissolve a quantity of moclobemide CRS, accurately weighed, with 0.1 mol/L Hydrochloric acid solution to produce a solution of 10 µg per ml as the reference solution. Measure the absorbance of the two solutions at 240 nm (Appendix IV A), calculate the content of $C_{13}H_{17}ClN_2O_2$.

Category As described under moclobemide.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Moclobemide Tablets

Moclobemide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of moclobemide ($C_{13}H_{17}ClN_2O_2$).

Description White or almost white tablets or film coated tablets with white or almost white core.

Identification (1) Dissolve a quantity of the powdered tablets, equivalent to about 50 mg of moclobemide, in a 25 ml volumetric flask in ethanol by shaking, dilute to volume, and mix well. Filter and use the successive filtrate as test solution. Prepare a reference solution by dissolving a quantity of moclobemide CRS to produce a solution of 2 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-ethanol-concentrated ammonia solution (8 : 2 : 1) as the mobile phase. Apply separately to the plate 15 µl each of the above two solutions, after developing and removal of the plate, dry in air and examine under ultra-violet light (254 nm). The position and colour of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 240 nm, and a minimum at 214 nm (Appendix IV A).

(3) Place a quantity of the powdered tablets, equivalent to about 0.1 g of moclobemide, in a suitable crucible, mix with 1 g of anhydrous sodium carbonate. Heat until it is thoroughly charred, then keep heating for 10 minutes. Dissolve the cooled residue in 5 ml of water and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Dissolution Carry out the method for dissolution test (Appendix X C, method 1), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle at 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes, filter. Measure accurately a quantity of the successive filtrate, dilute with 0.1 mol/L Hydrochloric acid solution to produce a solution of 10 µg per ml. Carry out the procedure as described under Assay, beginning at the words "Dissolve a quantity of moclobemide CRS". Calculate the dissolution of $C_{13}H_{17}ClN_2O_2$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets, with film coat removed if necessary. Weigh accurately a quantity of the powder, equivalent to about 20 mg of moclobemide, into a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution and shake to dissolve, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, filter. Dilute 5 ml of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to 100 ml and mix well as the test solution. Dissolve a quantity of moclobemide CRS, accurately weighed, with 0.1 mol/L hydrochloric acid solution to produce a solution of 10 µg per ml as the reference solution. Measure the absorbance of the two solutions at 240 nm (Appendix IV A), calculate the content of $C_{13}H_{17}ClN_2O_2$.

Category As described under moclobemide.

Strength (1) 75 mg (2) 0.1 g (3) 0.15 g

Storage Preserve in tightly closed containers, protected from light.

Moracizine Hydrochloride

$C_{22}H_{25}N_3O_4S \cdot HCl$ 463.98

Moracizine Hydrochloride is 10-(3-morpholinyl)-phenothiazine-2-carbamic acid ethylester hydrochloride. It contains not less than 99.0% of $C_{22}H_{25}N_3O_4S \cdot HCl$, calculated on the dried basis.

Description A white or almost white powder. Very soluble in methanol, soluble in water or ethanol, slightly soluble in acetone, insoluble in ethyl acetate; freely soluble in glacial acetic acid.

Specific absorbance Dissolve an accurately weighed quantity of the substance being examined, in a mixture of ethanol-water (1 : 1) to produce a solution of 0.1 mg per ml, measure accurately a quantity of the solution, dilute with water to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 268 nm (Appendix IV A), the value of A (1%, 1 cm), calculated on the dried basis, is 360-375.

Identification (1) Dissolve about 10 mg in 5 ml of water, add 1 drop of potassium heptaiodobismuthate TS, an orange red precipitate is produced immediately.

(2) Dissolve about 15 mg in 2 ml of water, add 0.5 ml of 1 mol/L hydroxylamine hydrochloride solution. Make the solution alkaline by adding dropwise 5 mol/L ethanolic potassium hydroxide solution, a white precipitate is produced. Boil the mixture for a few minutes, cool, acidify the solution with dilute hydrochloric acid, colour changes to pale violet. Add 1 or 2 drops of ferric chloride TS, the colour changes to intense violet.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of moracizine Hydrochloride (Appendix XVI).

(4) Yields the reactions characteristic of chlorides (Appendix III)

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of methanol-n-butanol (2 : 3) as mobile phase. Weigh accurately about 50 mg into a 5 ml volumetric flask, add a quantity of ethanol and 0.25 ml of ammonia TS, shake to dissolve, dilute with ethanol to volume as test solution. Transfer 1 ml of the test solution to a 200 ml volumetric flask, accurately measured, dilute with ethanol to volume as reference solution. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry it in air, visualize with iodine vapor after staying for half an hour. No any thirdly spot other than the principal spot obtained with the test solution in the chromatogram is observed. The colour of the spot in the chromatogram other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.4 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 46.40 mg of $C_{22}H_{25}N_3O_4S \cdot HCl$.

Category Antiarrhythmic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Moracizine Hydrochloride Tablets.

Moracizine Hydrochloride Tablets

Moracizine Hydrochloride Tablets contain not less

than 90.0% and not more than 110.0% of the labelled amount of moracizine hydrochloride ($C_{22}H_{25}N_3O_4S \cdot HCl$).

Description Sugar coated tablets with a white or almost white core.

Identification (1) To a quantity of powdered tablets with sugar coating removed, equivalent to about 15 mg of moracizine hydrochloride, add 2 ml of water, shake to dissolve moracizine hydrochloride and filter. Add 0.5 ml of 1 mol/L hydroxylamine hydrochloride solution to filtrate, make the solution alkaline by adding dropwise 5 mol/L ethanolic potassium hydroxide solution, a white precipitate is produced. Boil the mixture for a few minutes, cool, acidify the solution with dilute hydrochloric acid, colour changes to pale violet. Add 1 or 2 drops of ferric chloride TS, the colour changes to intense violet.

(2) To a quantity of powdered tablets with sugar coating removed, equivalent to about 30 mg of moracizine hydrochloride, add 10 ml of water, shake to dissolve moracizine hydrochloride and filter. The filtrate yields the reaction characteristic of chlorides. (Appendix III).

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 1000 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw a quantity of the solution after exactly 60 minutes and filter. Measure accurately a quantity of the successive filtrate, dilute with the dissolution medium to produce a solution of containing moracizine hydrochloride 10 μ g per ml. Measure the absorbance of the resulting solution at 268 nm (Appendix IV A), calculate the dissolution of $C_{22}H_{25}N_3O_4S \cdot HCl$ from each tablet, taking 367 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with coating removed. Triturate an accurately weighed quantity of the powder, equivalent to about 50 mg of moracizine hydrochloride, in a 250 ml volumetric flask, add 25 ml of ethanol, shake thoroughly to dissolve moracizine hydrochloride, dilute with water to volume, shake well and filter. Transfer 5 ml of the solution into a 100 ml volumetric flask, accurately measured, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 268 nm (Appendix IV A), calculate the content of $C_{22}H_{25}N_3O_4S \cdot HCl$, taking 367 as the value of A (1%, 1 cm).

Category As described under Moracizine Hydrochloride.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Morphine Hydrochloride

$C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$ 375.85

[52-26-6]

Morphine Hydrochloride is 7,8-didehydro-4,5-epoxy-17-methyl-(5 α , 6 α)-morphinan-3,6-diol hydrochloride trihydrate. It contains not less than 99.0% of $C_{17}H_{19}NO_3 \cdot HCl$, calculated on the dried basis.

Description White, silky needle crystals or a crystalline powder; odourless; deteriorated easily on exposure to light. Soluble in water; sparingly soluble in ethanol; practically insoluble in chloroform or ether.

Specific optical rotation -110.0° to -115.0° , dissolve 1 g of morphine hydrochloride in water in 50 ml volumetric flask (Appendix VI E). Dilute with water to volume.

Identification (1) To 1 mg add 1 drop of formaldehyde-sulfuric acid TS; an intense purple colour is produced.

(2) To 1 mg add 0.5 ml of molybdo-sulfuric acid TS, a violet colour is produced, turning to blue and then to brownish-green.

(3) Dissolve 1 mg in 1 ml of water, add 1 drop of dilute potassium ferricyanide TS; a bluish-green colour develops immediately (distinction from codeine).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of morphine hydrochloride (Appendix XVI).

(5) The aqueous solution yields the reaction characteristic of chlorides (Appendix III).

Acidity To a solution of 0.20 g in 10 ml of water add 1 drop of methyl red IS, if a red colour is produced, not more than 0.20 ml of sodium hydroxide (0.02 mol/L) VS. is required to change it to yellow.

Clarity and colour of solution Dissolve 0.5 g with 25 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Ammonium Heat 0.2 g with 5 ml of sodium hydroxide TS for 1 minute, the vapour evolved does not turn moistened red litmus paper to blue.

Apomorphine Dissolve 50 mg in 4 ml of water, add 0.10 g of sodium bicarbonate and 1 drop of iodine solution (0.1 mol/L) then shake with 5 ml of ether; the ether layer exhibits no red colour and the aqueous layer exhibits no green colour.

Meconate Dissolve 0.15 g in 5 ml of water, add 5 ml of dilute hydrochloric acid and 2 drops of ferric chloride TS; no red colour develops.

Foreign alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of 70% ethanol solution-toluene-acetone-concentrated ammonia solution (35 : 35 : 32.5 : 2.5) as the mobile phase. Apply separately to the plate 20 μ l each of the following two solutions. Dissolve 0.1 g of the substance being examined with 10 ml of a mixture of ethanol-water (1 : 1) as solution (1). Dissolve 50 mg of codeine phosphate CRS in 5 ml of solution (1) and dilute 0.1 ml with the mixture of ethanol-water (1 : 1) to 10 ml as solution (2). After developing and removal of the plate, dry it in air. Spray with bismuth potassium iodide TS. After 15 minutes, spray with hydrogen peroxide TS. The spot of codeine in the chromatogram obtained with solution (1) is not more intense than that of solution (2), any spot other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C,

loses not more than 15.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid and 4 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.18 mg of $C_{17}H_{19}NO_3 \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Morphine Hydrochloride Injection
(2) Morphine Hydrochloride Sustained-release Tablets
(3) Morphine Hydrochloride Tablets

Morphine Hydrochloride Injection

Morphine Hydrochloride Injection is a sterile solution of morphine hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of morphine hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$).

Description A clear, colourless liquid; deteriorate easily on exposure to light.

Identification When evaporated to dryness on a water bath, the residue complies with tests (1), (2), (3) and (5) for Identification described under Morphine Hydrochloride.

pH value 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the substance being examined and dilute with 0.1 mol/L sodium hydroxide solution to produce a solution of 20 µg per ml. Measure the absorbance at 250 nm (Appendix IV A). Dissolve an accurately weighed quantity of morphine CRS in 0.1 mol/L sodium hydroxide solution and dilute to produce a solution of 20 µg per ml. Repeat the operation, calculate the content and multiply with 1.317 as the content of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$.

Category As described under Morphine Hydrochloride.

Strength (1) 0.5 ml : 5 mg (2) 1 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Morphine Hydrochloride Sustained-release Tablets

Morphine Hydrochloride Sustained-release Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of morphine hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$).

Description Film coated tablets with white core.

Identification Triturate the tablets with coating removed. Transfer a quantity of the powdered tablets, equivalent to

about 20 mg of morphine hydrochloride, to mortar, add 10 ml of water, dissolve morphine hydrochloride and filter. Evaporate the filtrate to dryness. The residue complies with the test (1), (2), (3) and (5) for Identification as described under Morphine Hydrochloride.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Place 1 tablet in a mortar, add a quantity of water, triturate to dissolve morphine hydrochloride. Transfer the solution to 100 ml (10 mg per tablet), 250 ml (30 mg per tablet) or 500 ml (60 mg per tablet) volumetric flask, wash the mortar with water for several times, combine the wash solution, shake thoroughly, dilute to volume with water and mix well. Filter the resulting solution through a membrane with pores of 0.45 µm in diameter. Discard the initial filtrate and use the successive filtrate as the test preparation. Carry out the test as described under assay, beginning at the words "measure accurately 20 µl of the successive filtrate", and calculate the content of morphine hydrochloride.

Drug release Carry out the method for drug release test (Appendix X D, method 1) and use an apparatus for dissolution test (Appendix X C, method 1), using 500 ml of water as the release medium and adjust the rotational speed of the basket to 50 rpm. Withdraw a sample of 2 ml of the solution at exact 1, 2, 3, 4, 5 and 6 hours respectively, filter through a membrane with pores of 0.45 µm in diameter and supply 2 ml of same temperature water accordingly into the vessel immediately. Take the successive filtrate as test solution. Measure accurately a quantity of standard solution obtained under the assay, dilute with mobile phase to produce the solutions of 0.02 mg per ml (10 mg per tablet), 0.05 mg per ml (30 mg per tablet) and 0.1 mg per ml (60 mg per tablet) respectively. Carry out the method as described under the Assay. Calculate the content of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$ dissolved from each tablet at different release time separately. The dissolution of morphine hydrochloride complies with the requirement; the quantity dissolved of each tablet is 25%-45%, 40%-60%, 55%-75%, 65%-85%, 70%-90% and over 80% of the labelled amount of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$ respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of potassium dihydrogen phosphate (0.05 mol/L)-methanol (4 : 1) as the mobile phase. Detection wavelength is 280 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

Procedure Accurately weigh 10 tablets and triturate. Transfer a quantity of the powdered tablets, equivalent to about 35 mg of morphine hydrochloride, accurately weighed, to a 250 ml volumetric flask. Add a quantity of water and shake thoroughly to dissolve morphine hydrochloride, dilute to volume with water and mix well. Filter through a membrane with pores of 0.45 µm in diameter. Measure accurately 20 µl of the successive filtrate and inject it into the column and record the peak areas obtained in the chromatography correspondingly. Accurately weigh a quantity of morphine CRS, dissolve it with mobile phase to produce a solution of 0.1 mg per ml. Repeat the operation, and calculate the content of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$ with multiplying 1.317 by the peak area.

Category and Storage As described under Morphine Hydrochloride.

Strength (1) 10 mg (2) 30 mg (3) 60 mg

Morphine Hydrochloride Tablets

Morphine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of morphine hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$).

Description White tablets, deteriorated on exposure to light.

Identification To a quantity of powdered tablets, equivalent to about 20 mg of morphine hydrochloride, add 10 ml of water, shake well and filter. Evaporate the filtrate to dryness. The residue complies with the tests (1), (2), (3) and (5) for Identification described under Morphine Hydrochloride.

Content uniformity Comply with the requirements (Appendix X E). Place 1 tablet in a 100 ml (5 mg) or 200 ml (10 mg) volumetric flask, add 0.1 mol/L sodium hydroxide solution to volume, shake thoroughly and filter. Transfer 25 ml of the successive filtrate to 50 ml volumetric flask, dilute to volume with 0.1 mol/L sodium hydroxide solution and mix well. Measure the absorbance of the resulting solution at 250 nm (Appendix IV A), calculate the content of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$.

Dissolution Carry out dissolution test (Appendix X C, method 3), using 125 ml (5 mg) or 250 ml (10 mg) of water as dissolution medium, adjust the rotational speed to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, transfer 5 ml of the successive filtrate, accurately measured, to 10 ml volumetric flask, add 1 ml of 1 mol/L sodium hydroxide solution and dilute with water to volume, mix well. Dissolve a quantity of anhydrous morphine CRS in 0.1 mol/L sodium hydroxide solution and dilute with 0.1 mol/L sodium hydroxide solution to produce a solution of 10 µg per ml. Measure the absorbance of two solutions at 250 nm (Appendix IV A). Calculate the content and multiply by 1.317 as the dissolution of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$ from each tablet, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of powder equivalent to 10 mg of morphine hydrochloride, accurately weighed, in a 100 ml volumetric flask add 50 ml of water and shake well. Dilute with water to volume and mix well and filter. Transfer 15 ml of the successive solution, accurately measured, to 50 ml volumetric flask, add 25 ml of 0.2 mol/L sodium hydroxide solution and dilute with water to volume, mix well [solution (1)]. Dissolve a quantity of anhydrous morphine CRS in 0.1 mol/L sodium hydroxide solution and produce a solution of 20 µg per ml with 0.1 mol/L sodium hydroxide solution [solution (2)]. Measure the absorbance of solution (1) and (2) at 250 nm (Appendix IV A). Calculate the content and multiply with 1.317 as the content of $C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O$.

Category As described under Morphine Hydrochloride.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Morphine Sulfate

$(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ 758.83 [6211-15-0]

Morphine sulfate is 7,8-Didehydro-4,5 α-epoxy-17-methylmorphinan-3,6 α-diol sulphate (2 : 1) (salt) Pentahydrate. It contains not less than 98.0% and not more than 101.0% of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4$, calculated on the dried basis.

Description White, needle crystals or a crystalline powder; odourless.

Soluble in water; slightly soluble in ethanol; practically insoluble in chloroform or ether.

Specific optical rotation -107.0° to -109.5° , in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) To about 1 mg add 1 drop of formaldehyde sulfuric acid TS, a intense purple colour is produced immediately.

(2) Dissolve 1 mg in 1 ml of water, add 1 drop of dilute potassium ferricyanide TS, a bluish-green colour is produced immediately.

(3) The light absorption of a solution of 0.015% in water in the range of 230-350 nm (Appendix IV A) exhibits a maximum at 285 nm; the absorbance is about 0.65. The light absorption of a solution of 0.015% in 0.1 mol/L sodium hydroxide solution exhibits a maximum at 298 nm; the absorbance is about 1.1.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of morphine sulfate (Appendix XVI).

(5) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity To a solution of 0.20 g in 10 ml of water add 1 drop of methyl red IS, if a red colour is produced, not more than 0.20 ml of sodium hydroxide (0.02 mol/L) VS is required to change it to yellow.

Ammonium Heat 0.20 g with 5 ml of sodium hydroxide TS for 1 minute, the evolved vapour does not turn moistened red litmus paper to blue.

Foreign alkaloids Dissolve 0.50 g of dried substance being examined, accurately weighed, in 15 ml of water and 5 ml of sodium hydroxide TS in a separator. Shake and extract with three 10 ml portions of chloroform. Wash the combined chloroform extracts with 10 ml of 0.4% sodium hydroxide solution and followed two portions of 5 ml water. Evaporate the chloroform layer on a water bath to dry. The residue is not more than 7.5 mg after drying to constant weight at 105°C.

Loss on drying When dried at 145°C for 1 hour, loses 9.0%-12.0% of its weight (VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.25 g, accurately weighed, in 25 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate

with perchloric acid (0.05 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS is equivalent to 33.44 mg of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4$.

Category Analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparations Morphine Sulfate Sustained-release Tablets

Morphine Sulfate Sustained-release Tablets

Morphine Sulfate Sustained-release Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of morphine sulfate $[(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O]$.

Description Film coated tablets with white core.

Identification To a quantity of the powdered tablets, equivalent to 0.1 g of morphine sulfate, add 10 ml of water, shake to dissolve morphine sulfate and filter. Use the filtrate for the following tests.

(1) To 0.5 ml of the filtrate add 1 ml of formaldehyde sulfuric acid solution (to 0.5 ml of formaldehyde add 9.5 ml of sulfuric acid carefully); an intense purple colour is produced immediately.

(2) To 0.5 ml of the filtrate add 5 ml of water, and 1 drop each of potassium ferricyanide TS and ferric chloride solution (dissolve 5 g of ferric chloride in 100 ml of water); a bluish-green colour is produced and turns to blue immediately.

(3) To 5 ml of the filtrate add 1 ml of 2 mol/L hydrochloric acid solution, and 1 ml of barium chloride solution (dissolve 6.1 mg of barium chloride powder in 100 ml of water); a white precipitate develops immediately. Add 1 drop of iodine-potassium iodide solution (dissolve 2.0 g of iodine and 3.0 g of potassium iodide in 100 ml of water); a yellow precipitate is produced immediately. Add 2-3 drops of stannous chloride solution (Dissolve 33.0 g of stannous chloride in 10 ml of 2 mol/L hydrochloric acid solution, add water to 100 ml), boil and the colour of precipitate disappears.

Related substance To an accurately weighed quantity of the powdered tablets, equivalent to 20 mg of morphine sulfate, add 5 ml of hydroquinone solution (dissolve 30 mg of hydroquinone in 1000 ml of mobile phase), ultrasonic to dissolve morphine sulfate, shake thoroughly and filter, use the successive filtrate as test solution. Measure accurately a quantity of the successive filtrate in hydroquinone solution to produce a solution containing 40 µg per ml, use as reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (5 µm) and a mixture of methanol-sodium heptanesulfonate solution (dissolve 2.02 g of sodium heptanesulfonate in water, add 5 ml of glacial acetic acid, dilute to 1000 ml with water, mix well) (70 : 90) as the mobile phase. Detection wavelength is 233 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine sulfate. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20%-30% of full scale of the chart. Inject 10 µl of the reference solution and test solution respectively into the column, record the chromatogram for 4 times of the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak of the

test solution is not greater than the area of the principal peak of the reference solution in the chromatogram.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 powdered tablet to a 50 ml volumetric flask with hydroquinone solution quantitatively. Carry out the method as described under Assay, beginning at the words "ultrasonic to dissolve the morphine sulfate", calculate the content of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$.

Drug release Carry out the method for drug release test (Appendix X D, method 1) and the equipment comply with dissolution test (Appendix X C, method 2), using 900 ml of pH 6.5 phosphate buffer solution as the release medium and adjust the rotational speed of the paddle at 100 rpm. Withdraw a sample of 5 ml of the solution at exact 1, 2, 3, 4, 5 and 6 hours respectively, filter through membrane and supply 5 ml of pH 6.5 phosphate buffer solution accordingly in the vessel immediately. Use the filtrate as test solution. Dissolve a quantity of morphine sulfate CRS, accurately weighed, in pH 6.5 phosphate buffer solution to produce a solution of 0.03 mg per ml, use as reference solution. Proceed as described under Assay. Inject 10 µl of the test solution and reference solution into the column respectively, record the chromatogram and measure the peak areas. Calculate the content of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ dissolved from each tablet at 1, 2, 3, 4, 5 and 6 hours separately. The dissolution of morphine sulfate complies with the requirement; the quantity dissolved of each tablet is 30%-45%, 45%-65%, 55%-75%, 65%-85%, 75%-95% and over 80% of the labelled amount of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-sodium heptanesulfonate solution (dissolve 2.02 g of sodium heptanesulfonate in water, add 5 ml of glacial acetic acid, dilute to 1000 ml with water, mix well) (50 : 50) as the mobile phase. Detection wavelength is 233 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine sulfate.

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 30 mg of morphine sulfate into a 50 ml volumetric flask, add hydroquinone solution and ultrasonic to dissolve morphine sulfate, dilute to volume with hydroquinone solution and mix well. Filter. Transfer 2 ml of the successive filtrate, accurately measured, to a 25 ml volumetric flask, dilute with hydroquinone solution to volume, mix well. Inject 10 µl of the test solution into the column, record the chromatogram and measure the peak areas. Dissolve about 30 mg of morphine sulfate CRS, accurately weighed, in hydroquinone solution and dilute to produce a solution of 48 µg per ml. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Anesthetic and analgesic agent.

Strength 30 mg

Storage Preserve in tightly closed containers, protected from light.

Nalorphine Hydrobromide

$C_{19}H_{21}NO_3 \cdot HBr$ 392.29

[57-29-4]

Nalorphine Hydrobromide is 7, 8-didehydro-4,5 α -epoxy-17-(2-propenyl)-morphinan-3,6 α -diol Hydrobromide. It contains not less than 98.0% of $C_{19}H_{21}NO_3 \cdot HBr$, calculated on the dried basis.

Description A white or almost white, crystalline powder; odourless; darkens gradually in air. Soluble in water; sparingly soluble in ethanol; practically insoluble in chloroform or ether; soluble in dilute alkaline solution.

Specific optical rotation -100° to -105° , in a solution of 10 mg per ml in methanol (Appendix VI E).

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 1 drop of ammonia TS, a white precipitate is produced, which is soluble in sodium hydroxide TS.

(2) Dissolve about 0.1 g in 5 ml of water, add 1 drop of ferric chloride TS, a blue colour is produced.

(3) Dissolve about 50 mg in 2 ml of carbon tetrachloride, add 1 ml of bromine TS, no colour is produced in carbon tetrachloride layer while the aqueous layer becomes reddish-brown.

(4) The aqueous solution yields the reaction characteristic of bromide (Appendix III).

Acidity Dissolve 0.20 g in 10 ml of water, pH 4.0-5.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.20 g in 10 ml of water, fresh boiling and cool to room temperature, is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (8.6:1:0.4) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 20 mg of the substance being examined per ml, (2) 0.2 mg of morphine CRS per ml. After developing and removal of the plate, allow it to dry and spray with concentrated potassium iodoplatinate TS. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at $105^\circ C$, loses not more than 1.0% of its weight (Appendix VIII L), using 0.5 g.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 30 ml of glacial acetic acid and 10 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a

blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.23 mg of $C_{19}H_{21}NO_3 \cdot HBr$.

Category Morphine antagonist.

Storage Preserve in tightly closed containers, protected from light.

Preparation Nalorphine Hydrobromide Injection

Nalorphine Hydrobromide Injection

Nalorphine Hydrobromide Injection is a sterile solution of Nalorphine Hydrobromide in Water for Injections. It contains not less than 95.0% and not more than 105.0% of the labelled amount of nalorphine hydrobromide ($C_{19}H_{21}NO_3 \cdot HBr$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 10 ml add 1 drop of ferric chloride TS, a blue colour is produced.

(2) Yields the reaction characteristic of bromide (Appendix III).

pH value 2.7-3.3 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To 20 ml, accurately measured, add 5 ml of ammonia TS, extract with 5 quantities, each 15 ml, of a mixture of isopropanol-chloroform (1:3) and wash each extract with the same 7 ml portion of water and allow to stand. Combine the extracts and evaporate to dryness on a water bath. To the residue add 2 ml of dehydrated ethanol and evaporate to dryness. Add further 2 ml of dehydrated ethanol and again evaporate to dryness, cool. To the residue add 20 ml of chloroform, 30 ml of glacial acetic acid, 3 ml of acetic anhydride and 2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.23 mg of $C_{19}H_{21}NO_3 \cdot HBr$.

Category As described under Nalorphine Hydrobromide.

Strength 1 ml:10 mg

Storage Preserve in well closed containers, protected from light.

Naloxone Hydrochloride

$C_{19}H_{21}NO_4 \cdot HCl \cdot 2H_2O$ 399.87

[51481-60-8]

Naloxone Hydrochloride is 17-allyl-4,5 α -epoxy-3,14-dihydroxy morphinan-6-one hydrochloride dihydrate. It contains not less than 98.0% and not more than 102.0% of $C_{19}H_{21}NO_4 \cdot HCl$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless.

Freely soluble in water; soluble in methanol; practically insoluble in chloroform or ether.

Specific optical rotation -170° to -181° , in a solution of 25 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 10 mg in 2 ml of water, add 2 drops of nitric acid and 1 drop of silver nitrate TS, a white curdy precipitate is formed which is soluble in ammonia TS and reprecipitated on addition of nitric acid.

(2) Transfer about 2 mg to a small test tube, add 3-4 drops of citric-acetic anhydride TS, heat in a water bath at $80-90^{\circ}\text{C}$ for 3-5 minutes, a purple colour is produced.

(3) Dissolve about 1 mg in 1 ml of water, add 1 drop of dilute potassium ferricyanide TS, a bluish-green colour is produced.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of naloxone hydrochloride (Appendix XVI).

Loss on drying When dried at 90°C for 4 hours and then at 105°C to constant weight, loses not more than 11.0% of its weight (Appendix VIII L), using 0.5 g.

Related substances Protect from light in the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and methanol-ammoniated butanol [shake 100 ml of butanol with 60 ml of concentrate ammonia solution (1 \rightarrow 100), discard the lower layer] (5:95) as the mobile phase. Apply separately to the plate 5 μl each of two solutions in methanol containing (1) 8 mg per ml of the substance being examined (2) 0.08 mg per ml of (–)-4,5 α -epoxy-3,14-dihydroxymorphinan-6-one CRS. After developing and removal of the plate, dry it in air, spray with potassium ferricyanide-ferric chloride solution (Dissolve 100 mg of potassium ferricyanide in 20 ml of 10% ferric chloride solution, be prepared freshly). Any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Chloride content Dissolve about 0.3 g, accurately weighed, in 30 ml of methanol, add 5 ml of water and 6-7 drops of fluorescein IS. Titrate with silver nitrate (0.1 mol/L) VS until the colour changes to pink. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl. The chloride content is not less than 9.54% and not more than 9.94%, calculated on the dried basis.

Assay Dissolve about 0.3 g, accurately weighed, in 40 ml of glacial acetic acid, 10 ml of acetic anhydride, add 10 ml of mercuric acetate TS and 1-2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 36.38 mg of $\text{C}_{19}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$.

Category Morphine antagonist.

Storage Preserve in tightly closed containers, protected from light.

Preparation Naloxone Hydrochloride Injection

Naloxone Hydrochloride Injection

Naloxone Hydrochloride Injection is a sterile solution of naloxone hydrochloride in Water for

Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of naloxone hydrochloride ($\text{C}_{19}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$).

Description A clear, colourless liquid.

Identification (1) Complies with tests (1) and (3) for Identification described under Naloxone Hydrochloride.

(2) Evaporate a quantity of the injection in a porcelain evaporating dish in a boiling water bath to dryness, add 1 drop of citric-acetic anhydride TS, heat in a water bath at $80-90^{\circ}\text{C}$ for 3-5 minutes, a violet red colour is produced.

(3) The light absorption of the injection exhibits a maximum at 280 nm and a minimum at 263 nm (Appendix IV A).

pH value 3.0-4.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium octanesulfonate solution (mix 1.36 g of 1-octanesulfonate and 1.0 g of sodium chloride in 580 ml of water)-methanol-phosphoric acid (580 : 420 : 1) as the mobile phase. Detection wavelength is at 229 nm. Weigh 150 mg of disodium edetate to a 2000 ml volumetric flask, add 0.9 ml of hydrochloric acid, dissolve in water and dilute with water to the volume, mix well as the diluent. Dissolve a quantity of naloxone hydrochloride CRS and paracetamol CRS in the diluent and dilute to produce a solution of 20 μg of naloxone hydrochloride and 2.5 μg of paracetamol per ml as the solution (1). Inject 20 μl of the solution (1) into the column and record the chromatogram. The resolution factor between the peaks of naloxone hydrochloride and paracetamol is not less than 8.

Procedure Dissolve about 10 mg of naloxone hydrochloride CRS, accurately weighed, in the diluent in a 100 ml volumetric flask and dilute to the volume. Transfer 1 ml to 10 ml volumetric flask, accurately measured, dilute with the diluent to the volume, mix well, as the solution (2). Measure accurately a quantity of naloxone hydrochloride injection, equivalent to 2 mg of naloxone hydrochloride, into a 200 ml volumetric flask and dilute with the diluent to the volume, as the solution (3). Inject separately 100 μl each of the solution (2) and (3) into the column, both accurately measured. Calculate the content of $\text{C}_{19}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Naloxone hydrochloride.

Strength (1) 1 ml:0.4 mg (2) 1 ml:1 mg
(3) 2 ml:2 mg (4) 10 ml:4 mg

Storage Preserve in well closed containers, stored in a cool and dark place.

Nandrolone Phenylpropionate

$\text{C}_{27}\text{H}_{34}\text{O}_3$ 406.57

[62-90-8]

Nandrolone Phenylpropionate is the phenylpropionic ester of 17 β -hydroxyestr-4-en-3-one. It contains not less than 97.0% and not more than 103.0% of $C_{27}H_{34}O_3$, calculated on the dried basis.

Description A white or almost white crystalline powder with characteristic odour.

Soluble in ethanol; sparingly soluble in vegetable oil; practically insoluble in water.

Melting range 93–99°C (Appendix VI C).

Specific optical rotation +48° to +51°, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nandrolone phenylpropionate (Appendix XVI).

Related substances Carry out the method with the solution described under Assay. Inject 8 μ l of the solution into the column, adjust the attenuation so that the principal peak height is full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in methanol to produce solutions of 2 mg per ml (solution 1) and 0.04 mg per ml (solution 2), inject separately 8 μ l each of solution (1) and solution (2) into the column, and record the chromatograms for 1.5 folds of the retention times of the principal peak. Not more than three secondary peaks area and the sum of the areas of all secondary peaks are not greater than 1/2 and 3/4 of area of the principal peak in the chromatogram obtained with solution (2) respectively.

Loss on drying When dried to constant weight in vacuum over phosphorus pentoxide, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column of octadecylsilane bonded silica gel and methanol-water (82:18) as the mobile phase, and the wavelength of the detector is 241 nm. The number of the theoretical plates of the column is not less than 2300, calculated with reference to the peak of Nandrolone Phenylpropionate. The resolution factor between the peaks of Nandrolone Phenylpropionate and internal standard complies with the related requirements.

Internal standard solution Dissolve about 50 mg of progesterone, accurately weighed, in methanol in a 50 ml volumetric flask, dilute to volume and mix well.

Procedure Dissolve about 50 mg of Nandrolone Phenylpropionate CRS, accurately weighed, in methanol in a 25 ml volumetric flask and dilute to volume, mix well. Transfer 5 ml each of the solution and the internal standard solution, both accurately measured, in a 25 ml volumetric flask, dilute with methanol to volume, mix well. Inject 10 μ l of the resulting solution into the column. Repeat the operation, using the substance being examined instead of Nandrolone Phenylpropionate CRS, calculate the content of $C_{27}H_{34}O_3$.

Category Anabolic steroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Nandrolone Phenylpropionate Injection

Nandrolone Phenylpropionate Injection

Nandrolone Phenylpropionate Injection is a sterile solution of Nandrolone Phenylpropionate in oil. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nandrolone phenylpropionate ($C_{27}H_{34}O_3$).

Description A pale yellow clear oily liquid.

Identification (1) To an amount of injection equivalent to 50 mg of nandrolone phenylpropionate add 8 ml of petroleum ether (boiling range 40–60°C), extract with three 8 ml portions of glacial acetic acid-water (7:3), wash the combined extracts with 10 ml of petroleum ether and discard the washing. To the washed solution add water until it is turbid, cool in an ice bath for 2 hours and filter. Wash the residue with water and dry it in vacuum over phosphorus pentoxide; a white crystalline powder is obtained. Dissolve this powder and nandrolone phenylpropionate CRS in acetone separately to produce two solutions of 5 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-heptane-acetone (2:1) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions mentioned above. After developing and removal of the plate, dry it in air and spray with sulfuric acid-ethanol (1:49), heat at 110°C for 15 minutes. The principal spots in the chromatogram obtained with the two solutions are identical on colour and position.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay. Test (1) and (2) are alternative.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), with an octadecylsilane bonded silica gel column using methanol-water (7:3) as the mobile phase. Wavelength of the detector is 254 nm. Number of theoretical plates of the column is not less than 600, calculated with reference to the peak of nandrolone phenylpropionate; the resolution factor between the peaks of nandrolone phenylpropionate, and internal standard complies with related requirements.

Internal Standard Solution Dissolve 50 mg of nandrolone phenylpropionate CRS, accurately weighed, in 25 ml of methanol.

Procedure Dissolve about 50 mg of testosterone propionate CRS, accurately weighed, in 25 ml of methanol. Transfer 5 ml each of the solution and internal standard solution to a 25 ml volumetric flask, dilute with methanol to volume and mix well, inject 5–10 μ l into the column, record the chromatogram. Transfer an accurately measured amount of the injection equivalent to about 50 mg of nandrolone phenylpropionate to a 25 ml volumetric flask, wash the interior of the pipet with several portions of ether, add the washings to the same volumetric flask, dilute with ether to volume and mix well. Transfer 5 ml of the ethereal solution, accurately measured, to a centrifuge tube with stopper, expel the ether on a water bath. Shake with 5 ml of methanol for 10 minutes and centrifuge for 15 minutes, repeat the extraction with 5 ml, 5 ml, 3 ml of methanol successively and transfer the methanol layers to another 25 ml volumetric flask. Add 5 ml of internal standard solution, dilute with methanol to volume and mix well, then inject

5-10 μ l into the column, record the chromatogram. Calculate the content of $C_{27}H_{34}O_3$.

Category As described under Nandrolone Phenylpropionate.

Strength (1) 1 ml:10 mg (2) 1 ml:25 mg

Storage Preserve in well closed containers, protected from light.

Naphazoline Hydrochloride

$C_{14}H_{14}N_2 \cdot HCl$ 246.74

[550-99-2]

Naphazoline Hydrochloride is 2-(1-naphthylmethyl)-2-imidazoline monohydrochloride. It contains not less than 98.5% of $C_{14}H_{14}N_2 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Freely soluble in water; soluble in ethanol; very slightly soluble in chloroform; insoluble in ether.

Identification (1) Dissolve about 20 mg in a few drops of dilute hydrochloric acid and 5 ml of water, add a few drops of ammonium reineckate TS, a purple precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of naphazoline hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chloride (Appendix III).

Acidity Dissolve 0.2 g in 20 ml of water, pH 5.5-6.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of methanol-diethylamine (100:2) as the mobile phase. Apply separately to the plate 10 μ l each of four solutions of the substance being examined in methanol containing (1) 20 mg per ml, (2) 0.10 mg per ml, (3) 0.20 mg per ml and (4) 0.30 mg per ml. After developing and removal of the plate, dry it in air, heat at 105°C for an hour, visualize with iodine vapour until the chromatogram obtained with solutions (2), (3) and (4) show clearly visible spot respectively. Compare with any secondary spot in the chromatogram obtained with solution (1) with the principal spots obtained with solutions (2), (3) and (4), the total amount of impurities does not exceed 2.0%.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 3 ml of mercuric acetate TS and 1 drop of crystal violet TS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.67 mg of $C_{14}H_{14}N_2 \cdot HCl$.

Category Vasoconstrictor.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Naphazoline Hydrochloride Eye Drops
(2) Naphazoline Hydrochloride Nasal Drops

Naphazoline Hydrochloride, Chlorphenamine Maleate and Vitamin B₁₂ Eye Drops

Naphazoline Hydrochloride, Chlorphenamine Maleate and Vitamin B₁₂ Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of Naphazoline Hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$), Chlorphenamine Maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) and Vitamin B₁₂ ($C_{63}H_{88}CoN_{14}O_{14}P$) respectively.

Formula Naphazoline Hydrochloride	0.02 g
Chlorphenamine Maleate	0.2 g
Vitamin B ₁₂	0.1 g
Excipient	a quantity
Water for Injection	a sufficient quantity

To make 1000 ml

Description A clear, pink liquid; odour, characteristic.

Identification (1) To 5 ml add 3 ml of sodium hydroxide TS and 3 ml of ether, shake and allow it to separate. Evaporate the ether extract to dryness at room temperature. Dissolve the residue in 0.5 ml of chloroform as test solution. Dissolve separately a quantity of naphazoline hydrochloride CRS and chlorphenamine maleate CRS in water to produce naphazoline hydrochloride solution of 20 μ g per ml and chlorphenamine maleate solution of 200 μ g per ml. Complete the procedure as described under test solution using 5 ml of the two solutions separately to produce reference solution (1) and reference solution (2). Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-acetone-concentrated ammonia solution (73:15:10:2) as the mobile phase. Apply separately to the plate 10 μ l each of above three solutions, after developing and removal of the plate, dry it in air, spray with dilute potassium iodobismuthate TS. The colour and position of the two principal spots in the chromatogram obtained with the test solution correspond to the principal spots obtained with reference solution (1) and reference solution (2).

(2) The absorbance of the solution obtained in Assay of Vitamin B₁₂ exhibits two maxima at 550 nm and 361 nm (Appendix IV A). The ratio of the absorbance at 550 nm to that at 361 nm is 0.29-0.32.

pH value 4.5-6.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay *Naphazoline hydrochloride and chlorphenamine maleate* Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel. Dissolve 4.32 g of octane sulfonate sodium and 7.6 g of anhydrous citric acid in 1800 ml of water, adjust pH to 3.0 with 1 mol/ml sodium hydroxide solution, dilute to 2000 ml with water, mix 1300 ml of the solution with 700 ml of acetonitrile as the mobile phase. Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 2500,

calculated with reference to the peak of naphazoline hydrochloride. The resolution factor between the peaks of chlorphenamine maleate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of *p*-aminoisopropyl benzoate with the mobile phase to produce a solution of 5 µg per ml.

Procedure Measure accurately 5 ml of the eye drops to a 10 ml volumetric flask, dilute with the internal standard solution to volume, mix well. Inject 20 µl of the resulting solution into the column, record the peak area correspondingly obtained in the chromatogram. Dissolve a quantity of naphazoline hydrochloride CRS and chlorphenamine maleate CRS with water to produce a solution of 20 µg of naphazoline hydrochloride and 0.2 mg of chlorphenamine maleate per ml. Measure accurately 5 ml of the solution to a 10 ml volumetric flask, dilute with the internal standard solution to volume, mix well. Inject 20 µl of the resulting solution into the column, calculate the content of $C_{14}H_{14}N_2 \cdot HCl$ and $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$.

Vitamin B₁₂ Measure accurately 2 ml of the eye drops to a 10 ml volumetric flask, dilute with water to volume, mix well as test solution. Dissolve an accurately weighed quantity of vitamin B₁₂ CRS with water to produce a solution of 20 µg of vitamin B₁₂ per ml as reference solution. Measure the absorbance of the resulting solutions at 361 nm (Appendix IV A), calculate the content of $C_{63}H_{88}CoN_{14}O_{14}P$.

Category Ophthalmics.

Strength 10 ml

Storage Preserve in tightly closed containers.

Naphazoline Hydrochloride Eye Drops

Naphazoline Hydrochloride Eye Drops contain not less than 90.0% and not more than 110.0% of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Dilute a quantity, equivalent to about 25 mg of naphazoline hydrochloride, with 5 ml of sodium hydroxide TS in a separator, make saturation with sodium chloride, extract with two 25 ml quantities of ether. Combine the ether layers and wash with 5 ml water. Filter and evaporate to dryness. The residue complies with the test for Identification (1) described under Naphazoline Hydrochloride.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution.

pH value 5.5-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-triethylamine-phosphoric acid (50:50:0.25:0.075) as the mobile phase. Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 400, calculated with reference to the peak of naphazoline hydrochloride.

Procedure Measure accurately 5 ml (for strength 0.1%) or 10 ml (for strength 0.05%) to a 50 ml volumetric flask,

dilute with water to volume and mix well as the test solution. Inject 20 µl into the column and record the chromatogram. Dissolve about 25 mg of naphazoline hydrochloride CRS, accurately weighed, in water in a 50 ml volumetric flask, dilute to volume and mix well, measure accurately 5 ml to a 25 ml volumetric flask and mix well as the reference solution. Repeat the operation using the reference solution instead of the test solution. Calculate the content of $C_{14}H_{14}N_2 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Naphazoline Hydrochloride.

Strength (1) 0.05% (2) 0.1%

Storage Preserve in tightly closed containers, protected from light.

Naphazoline Hydrochloride Nasal Drops

Naphazoline Hydrochloride Nasal Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of naphazoline hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Transfer a quantity of nasal drops equivalent to about 25 mg of naphazoline hydrochloride to a separator, add 5 ml of sodium hydroxide TS, saturate with sodium chloride, and extract twice with 25 ml each of ether. Wash the combined ether extract with 5 ml of water, filter, evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Naphazoline Hydrochloride.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

pH value 5.5-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for nasal preparations (Appendix I R).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-triethylamine-phosphoric acid (50:50:0.25:0.075) as the mobile phase. Detection Wavelength is 280 nm. The number of the theoretical plates of the column is not less than 400, calculated with reference to the peak of naphazoline hydrochloride.

Procedure Transfer accurately 5 ml (for strength 0.1%) or 10 ml (for strength 0.05%) of the substance being examined to a 50 ml volumetric flask, dilute with methanol to volume, mix well as the test solution. Inject 20 µl of the test solution into the column and record the chromatogram. Dissolve about 25 mg of naphazoline hydrochloride CRS, weighed accurately, with methanol in a 50 ml volumetric flask, dilute with methanol to volume, mix well. Measure accurately 5 ml into a 25 ml volumetric flask and dilute with water to volume, mix well as the reference solution. Repeat the operation instead of the test solution, calculate the content of $C_{14}H_{14}N_2 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Naphazoline Hydrochloride.

Strength (1) 0.05% (2) 0.1%

Storage Preserve in tightly closed containers, protected

from light.

Naproxen

$C_{14}H_{14}O_3$ 230.26

[22204-53-1]

Naproxen is (+)-6-methoxy- α -methyl-2-naphthylpropanoic acid. It contains not less than 98.5% of $C_{14}H_{14}O_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless. Soluble in methanol, ethanol or chloroform; sparingly soluble in ether; practically insoluble in water.

Melting range 153-158°C (Appendix VI C).

Specific optical rotation +63.0° to +68.5° in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) The light absorption of a 30 μ g per ml solution in methanol exhibits four maxima at 262 nm, 271 nm, 317 nm and 331 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of naproxen (Appendix XVI).

Chloride To 0.50 g add 50 ml of water, shake for 10 minutes, filter (moisten the filter Paper previously with dilute nitric acid). Discard the initial filtrate, carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.5 ml of sodium chloride standard solution (0.030%).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (75:25) (adjust with phosphoric acid to pH 3.0) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naproxen, the resolution factor between the peaks of naproxen and the impurity complies with the related requirements. Dissolve a quantity in the mobile phase, shake thoroughly to dissolve naproxen and dilute to produce a solution of 0.5 mg per ml as the solution (1). Dissolve a quantity of 6-methoxy-2-acetonaphthone CRS in the mobile phase and dilute to produce the solution (2) of 50 μ g per ml. Transfer 1 ml of solution (1) and 2 ml of solution (2) respectively, accurately measured, to a 200 ml volumetric flask and dilute with the mobile phase to the volume, mix well, as the solution (3). Inject 20 μ l of the solution (3) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 10 μ l each of the solution (1) and (3), both accurately measured, into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. The area of the peak with the same retention time as 6-methoxy-2-acetonaphthone, obtained with solution (1), is not greater than that of 6-methoxy-2-acetonaphthone obtained with solution (3) (0.1%). The area of the largest impurity except 6-methoxy-2-acetonaphthone

is not greater than twice of the area of 6-methoxy-2-acetonaphthone in solution (3) (0.2%). The sum of the areas of all peaks other than the naproxen peak obtained with solution (1) is not greater than the area of the naproxen peak obtained with solution (3) in the chromatogram (0.5%).

Loss on drying When dried at 105°C for 3 hours, loses no more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in the test for Residue on ignition, not more than 0.002%.

Assay Dissolve about 0.5 g, accurately weighed, in 45 ml of methanol, add 15 ml of water and 3 drops of phenolphthalein IS. Titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 23.03 mg of $C_{14}H_{14}O_3$.

Category Antipyretic, analgesic, non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Naproxen Capsules
(2) Naproxen Granules
(3) Naproxen Injection
(4) Naproxen Suppositories
(5) Naproxen Tablets

Naproxen and Codeine Phosphate Tablets

Naproxen and Codeine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$), and not less than 90.0% and not more than 110.0% of the labelled amount of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$) in each tablet.

Formula	Naproxen	150 g
	Codeine Phosphate	15 g
	Excipient	a quantity
	to make	1000 tablets

Description White or almost white tablets.

Identification Weigh a quantity of the powdered tablets, equivalent to about 1 g of naproxen and 0.1 g of codeine phosphate, add 15 ml of water and 5 ml of dilute sulfuric acid TS, ultrasonic for 10 minutes and filter, the successive filtrate is used as the test solution (1) for identification; Transfer all the residue to a 50 ml conical flask by 25 ml of anhydrous ethanol, ultrasonic for 10 minutes and filter, the successive filtrate is used as the test solution (2) for identification.

(1) Transfer a quantity of the test solution (1) to a separator, add drops of ammonia TS to make the solution alkaline (pH value is about 10), extract with 15 ml of chloroform, wash the chloroform layer with a small quantity of water, evaporate the chloroform layer in vacuum to dryness. To about 1 mg of the residue on a white porcelain dish, add 0.5 ml of sulfuric acid containing 2.5 mg of selenic

acid, a green colour is produced immediately which turns to blue gradually.

(2) Dissolve about 1 mg of the residue of test (1) for identification in 1 ml of methanol as the test solution. Dissolve an accurately weighed quantity of codeine phosphate CRS in methanol to produce a solution of 1 mg of codeine phosphate per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (85:10:5) as the mobile phase. Apply separately to the plate 10 μ l of each of the above two solutions. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with the test solution corresponds in colour and position to the principal spot obtained with the reference solution.

(3) Dilute a quantity of the test solution (2) with anhydrous ethanol to produce a solution of 30 μ g of naproxen per ml. The absorbance of the solution exhibits four maxima at 262 nm, 271 nm, 317 nm and 331 nm (Appendix IV A).

(4) Add drops of sodium hydroxide TS to a small quantity of the test solution (1) to adjust the pH to neutral. The solution yields the reactions characteristic of phosphates (Appendix III).

Related substances Weigh accurately a quantity of the powdered tablets, equivalent to about 1.0 g of naproxen, add 15 ml of water and 5 ml of dilute sulfuric acid TS, ultrasonic for 10 minutes and filter. Transfer all the residue to a 25 ml volumetric flask with a quantity of anhydrous ethanol, ultrasonic for 10 minutes, dilute with anhydrous ethanol to volume, shake thoroughly and filter, the successive filtrate is used as the test solution. Measure accurately a quantity of the test solution, dilute with anhydrous ethanol to produce a solution of 0.20 mg of naproxen per ml as the reference solution (1). Dissolve an accurately weighed quantity of 6-methoxy-2-acetonaphthone CRS in anhydrous ethanol to produce a solution of 40 μ g per ml as the reference solution (2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-tetrahydrofuran-glacial acetic acid (90:9:3) as the mobile phase. Apply separately to the plate 10 μ l of each of the above three solutions, after developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution (1). Any fluorescence spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution (2).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). To 1 tablet in a 50 ml volumetric flask, add a quantity of 75% methanol solution, carry out the procedure as described under the Assay, beginning at the words "ultrasonic for 10 minutes...". Calculate the content of $C_{14}H_{14}O_3$ and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 7.4) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. The successive filtrate is used as the test solution. Measure accurately 5 ml of the reference solution as described under the Assay in a 25 ml volumetric flask, dilute with the dissolution medium to volume and mix well as the reference solution. Measure accurately 100 μ l each of the test solution and the reference solution, carry out the method in the Assay. Calculate the dissolution of $C_{14}H_{14}O_3$

and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$ from each tablet. Not

less than 70% of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$ of the labelled amount and 80% of $C_{14}H_{14}O_3$ of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-methanol-tetrahydrofuran (4:6:0.04) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of codeine phosphate. The resolution factor between the peaks of codeine phosphate and naproxen is more than 2.0.

Procedure Weigh accurately and powder 20 tablets. To an accurately weighed quantity of powder, equivalent to about 150 mg of naproxen and 15 mg of codeine phosphate respectively, in a 50 ml volumetric flask, add a quantity of 75% methanol solution, ultrasonic for 10 minutes, dilute with 75% methanol solution to volume, shake thoroughly and filter. Measure accurately 3 ml of the successive filtrate into a 10 ml volumetric flask, dilute with 75% methanol solution to volume and mix well as the test solution. Inject 20 μ l of the test solution into the column, record the chromatogram. Dissolve an accurately weighed quantity of naproxen CRS and codeine phosphate CRS in 75% methanol solution to produce a solution of 0.9 mg of naproxen and 0.09 mg of codeine phosphate per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{14}H_{14}O_3$ and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$ respectively with respect to the peak areas obtained in the chromatogram by the external standard method. The coefficient 1.068 is used in the calculation of the content of codeine phosphate.

Category Analgetic.

Storage Preserve in tightly closed containers, stored in a cold place and protected from light.

Naproxen Capsules

Naproxen Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$).

Identification A quantity of the contents complies with tests for Identification described under Naproxen Tablets.

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (75:25) (adjust with phosphoric acid to pH 3.0) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naproxen. The resolution factor between the peaks of naproxen and the impurity complies with the related requirements. Dissolve a quantity of the content, equivalent to 25 mg naproxen, in the mobile phase in a 50 ml volumetric flask, shake thoroughly to dissolve naproxen and dilute to the volume.

mix well and filter. Take the successive filtrate as solution (1). Dissolve a quantity of 6-methoxy-2-acetonaphthone CRS in the mobile phase and dilute to produce the solution (2) of 50 µg per ml. Transfer 1 ml each of solution (1) and solution (2) respectively, accurately measured, to a 100 ml volumetric flask and dilute with the mobile phase to the volume, mix well as the solution (3). Inject 20 µl of the solution (3) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 10 µl each of the solution (1) and (3), both accurately measured, into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. The area of the peak with the same retention time as 6-methoxy-2-acetonaphthone, obtained with solution (1), is not greater than that of 6-methoxy-2-acetonaphthone obtained with solution (3) (0.1%). The area of the largest impurity except 6-methoxy-2-acetonaphthone is not greater than twice of the area of 6-methoxy-2-acetonaphthone in solution (3) (0.2%). The sum of the areas of all peaks other than the naproxen peak obtained with the solution (1) is not greater than the area of the naproxen peak obtained with the solution (3) in the chromatogram.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 7.4) (Dissolve 2.28 g of sodium Dihydrogen phosphate and 11.50 g of disodium hydrogen phosphate with water and dilute to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dissolve naproxen CRS, accurately weighed, with the dissolution medium and dilute to produce a solution of 100 µg per ml. Measure the absorbances of the resulting solutions at 331 nm (Appendix IV A). Calculate the dissolution of $C_{14}H_{14}O_3$ from each tablet, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix the contents obtained in the test for weight variation for contents. Dissolve an accurately weighed quantity equivalent to about 0.5 g of naproxen in 45 ml of methanol, complete the Assay described under Naproxen, beginning at the words "add 15 ml of water...". Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 23.03 mg of $C_{14}H_{14}O_3$.

Category As described under Naproxen.

Strength (1) 0.125 g (2) 0.2 g (3) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Naproxen Granules

Naproxen Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$).

Description Granules with colour.

Identification (1) Dissolve a quantity, equivalent to about 5 mg of naproxen, in 5 ml of dehydrated ethanol and filter to a tube. To the filtrate add 2 ml of sulfuric acid along with the wall of the tube; The sulfuric acid layer turns to yellow, allow to stand and examine under ultra-violet light, the interface of two layers exhibits a yellowish-green fluorescence.

(2) Dissolve a quantity, equivalent to about 8 mg of

naproxen, in dehydrated ethanol in a 100 ml volumetric flask by shaking, dilute to volume, mix well and filter. The light absorption of the filtrate exhibits maxima at 262 nm, 271 nm, 317 nm and 331 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (75:25) (adjust with phosphoric acid to pH 3.0) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naproxen, the resolution factor between the peaks of naproxen and the impurity complies with the related requirements. Dissolve a quantity of powdered granules, equivalent to 25 mg naproxen in the mobile phase, in 50 ml volumetric flask, shake thoroughly to dissolve naproxen and dilute to the volume, mix well and filter. Take the successive filtrate as solution (1). Dissolve a quantity of 6-methoxy-2-acetonaphthone CRS in the mobile phase and dilute to produce the solution (2) of 50 µg per ml. Transfer 1 ml each of solution (1) and solution (2) respectively, accurately measured, to a 100 ml volumetric flask and dilute with the mobile phase to the volume, mix well as the solution (3). Inject 20 µl of the solution (3) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 10 µl each of the solution (1) and (3), both accurately measured, into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. The area of the peak with the same retention time as 6-methoxy-2-acetonaphthone, obtained with solution (1), is not greater than that of 6-methoxy-2-acetonaphthone obtained with solution (3) (0.1%). The area of the largest impurity except 6-methoxy-2-acetonaphthone is not greater than twice of the area of 6-methoxy-2-acetonaphthone in solution (3) (0.2%). The sum of the areas of all peaks other than the naproxen peak obtained with the solution (1) is not greater than the area of the naproxen peak obtained with the solution (3) in the chromatogram.

Other requirements Comply with the general requirements for granules except dispersing capacity (Appendix I N).

Assay Dissolve an accurately weighed quantity of the powdered contents obtained in the test for weight variation of contents, equivalent to about 0.4 g of naproxen, in 25 ml of water in a separator, extract with chloroform for 4 times, first time 20 ml, the following three times each 10 ml, respectively. Combine the chloroform layers, wash with two 10 ml portions of water, combine the chloroform layers into a vonical flask, evaporate to dryness on a water bath. Dissolve the residue in 30 ml of neutral ethanol (neutral to phenolphthalein IS), add 1 drop of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 23.03 mg of $C_{14}H_{14}O_3$.

Category As described under Naproxen.

Strength 10 g : 0.25 g

Storage Preserve in well closed containers, protected from light.

Naproxen Injection

Naproxen Injection is a sterile solution of naproxen

in Water for Injection with suitable vehicle. It contains not less than 90.0% and not more than 110.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$).

Description A clear, almost colourless or pale yellow liquid.

Identification The light absorption of the solution obtained for Assay exhibits maxima at 262 nm, 271 nm, 318 nm and 330 nm (Appendix IV A).

pH value 7.5-9.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve a quantity, accurately measured, in sodium hydroxide (0.1 mol/L) VS, to produce a solution of 40 µg per ml. Measure the absorbance at 330 nm (Appendix IV A), then repeat the operation with Naproxen CRS instead of the substance being examined. Calculate the content of $C_{14}H_{14}O_3$.

Category As described under Naproxen.

Strength (1) 2 ml : 100 mg (2) 2 ml : 200 mg

Storage Preserve in well closed containers, protected from light.

Naproxen Suppositories

Naproxen Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$).

Description Creamy-white or faintly yellow suppositories.

Identification Dilute the solution obtained in the Assay with methanol to make a solution containing 30 µg per ml of naproxen. The light absorption of the solution exhibits maxima at 262 nm, 271 nm, 317 nm and 330 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (75:25) (adjust with phosphoric acid to pH 3.0) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naproxen, the resolution factor between the peaks of naproxen and the impurity complies with the related requirements. Weigh accurately a quantity, melt by warming on a water bath, then cool to room temperature, equivalent to about 50 mg of naproxen, in 50 ml volumetric flask, dilute with methanol to the volume and heat on a water bath at 50-60°C and shake well. Allow to stand for 10 minutes and cool to room temperature. After freezing in refrigerator for 1 hour, filter immediately, and cool to room temperature. Measure accurately 25 ml of the successive filtrate in a 50 ml volumetric flask, dilute with the mobile phase to the volume, mix well. Filter with the membrane (0.45 µm) and take the successive filtrate as the solution (1). Dissolve a quantity of 6-methoxy-2-acetonaphthone CRS in the mobile phase and dilute to produce the solution (2) of 50 µg per ml. Transfer 1 ml each of solution (1) and solution (2) respectively, accurately measured, to a 100 ml volumetric flask and dilute with the mobile phase to the volume, mix well as the solution (3). Inject 20 µl of the solution (3)

into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 10 µl each of the solution (1) and (3), both accurately measured, into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. The area of the peak with the same retention time as 6-methoxy-2-acetonaphthone, obtained with solution (1), is not greater than that of 6-methoxy-2-acetonaphthone obtained with solution (3) (0.1%). The area of the largest impurity except 6-methoxy-2-acetonaphthone is not greater than twice of the area of 6-methoxy-2-acetonaphthone in solution (3) (0.2%). The sum of the areas of all peaks other than the naproxen peak obtained with the solution (1) is not greater than the area of the naproxen peak obtained with the solution (3) in the chromatogram.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Reference solution preparation Weigh accurately about 50 mg of naproxen CRS in a 100 ml volumetric flask, add 70 ml of methanol, heat on a water bath at 50-60°C and shake well. Cool to temperature, dilute with methanol to volume, mix well. Transfer accurately 5 ml of the solution to a 50 ml volumetric flask, dilute with methanol to volume and mix well.

Test solution preparation Weigh accurately 10 suppositories, melt by warming on a water bath, cool to room temperature with constant stirring. To a quantity equivalent to about 50 mg of naproxen, accurately weighed, in a 100 ml volumetric flask, add 70 ml of methanol, heat on a water bath at 50-60°C and shake well. Heat for 10 minutes more and cool on a cold water bath for 1.5 hours. Allow to cool to room temperature, dilute with methanol to volume, mix well, filter. Transfer accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with methanol to volume and mix well.

Procedure Measure the absorbance of the solution at 331 nm (Appendix IV A). Calculate the content of $C_{14}H_{14}O_3$.

Category As described under Naproxen.

Strength 0.25 g

Storage Preserve in well closed containers, protected from light, stored at a temperature below 30°C.

Naproxen Tablets

Naproxen Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of naproxen ($C_{14}H_{14}O_3$).

Description White or almost white tablets.

Identification Extract a quantity of the powdered tablets with methanol to produce a 30 µg per ml solution of naproxen, filter. The light absorption of the filtrate exhibits four maxima at 262 nm, 271 nm, 317 nm and 331 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (75:25) (adjust with phosphoric acid to pH 3.0) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of naproxen, the

resolution factor between the peaks of naproxen and the impurity complies with the related requirements. Dissolve a quantity of powdered tablets, equivalent to 25 mg naproxen, in the mobile phase in a 50 ml volumetric flask, shake thoroughly to dissolve naproxen and dilute to the volume, mix well and filter. Take the successive filtrate as solution (1). Dissolve a quantity of 6-methoxy-2-acetonaphthone CRS in the mobile phase and dilute to produce the solution (2) of 50 µg per ml. Transfer 1 ml each of solution (1) and solution (2) respectively, accurately measured, to a 100 ml volumetric flask and dilute with the mobile phase to the volume, mix well as the solution (3). Inject 20 µl of the solution (3) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 10 µl each of the solution (1) and (3), both accurately measured, into the column and record the chromatogram for 2.5 times of the retention time of the principal peak. The area of the peak with the same retention time as 6-methoxy-2-acetonaphthone, obtained with solution (1), is not greater than that of 6-methoxy-2-acetonaphthone obtained with solution (3) (0.1%). The area of the largest impurity except 6-methoxy-2-acetonaphthone is not greater than twice of the area of 6-methoxy-2-acetonaphthone in solution (2) (0.2%). The sum of the areas of all peaks other than the naproxen peak obtained with the solution (1) is not greater than the area of the naproxen peak obtained with the solution (3) in the chromatogram.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 7.4) (dissolve 2.28 g of sodium dihydrogen phosphate and 11.50 g of disodium hydrogen phosphate with water, and dilute to 1000 ml) as dissolution medium. The rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter, take the successive filtrate as test solution. Weigh accurately a quantity of naproxen CRS, and dissolve with the dissolution medium to produce solutions of 100 µg (for strength 0.1 g) or 125 µg (for strength 0.125 g) or 250 µg (for strength 0.25 g) per ml as the reference solution. Measure the absorbances of the resulting solutions at 331 nm (Appendix IV A). Calculate the dissolution of $C_{14}H_{13}NaO_3$ from each tablets, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity, equivalent to about 0.5 g of naproxen in 45 ml of methanol. Complete the Assay described under Naproxen, beginning at the words "add 15 ml of water...". Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 23.03 mg of $C_{14}H_{13}NaO_3$.

Category As described under Naproxen.

Strength (1) 0.1 g (2) 0.125 g (3) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Naproxen Sodium

$C_{14}H_{13}NaO_3$ 252.25

[26159-34-2]

Naproxen sodium is (S)-(-)-sodium (S)-6-methoxy- α -methyl-2-naphthaleneacetate. It contains not less than 98.0% and not more than 102.0% of $C_{14}H_{13}NaO_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; slightly hygroscopic.

Freely soluble in water; soluble in methanol; sparingly soluble in ethanol; very slightly soluble in acetone; practically insoluble in chloroform or toluene.

Specific optical rotation To 0.5 g add 6 ml of water. Add 2.4 ml of 1 mol/L hydrochloric acid solution dropwise with shaking until a precipitate is produced. Wash the precipitate with water until the washing is neutral, dry to constant at 105°C and weigh accurately. Dissolve the precipitate in chloroform to produce a solution of 10 mg per ml, the specific optical rotation of the resulting solution is +63° to +69° (Appendix VI E).

Identification (1) Dissolve about 0.1 g in 2 ml of water, add a few drops of dilute hydrochloric acid; a white precipitate is produced. Filter, the filtrate yields the reactions characteristic of sodium salts (Appendix III).

(2) The infrared absorption spectrum of the substance being examined, dried at 105°C for 3 hours, is concordant with the reference spectrum of naproxen sodium (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of toluene-tetrahydrofuran-glacial acetic acid (30:3:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 20 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Free naproxen Dissolve 5.0 g, accurately weighed, in 25 ml of water in a separator, extract the solution with three 15 ml portions of chloroform, and evaporate the combined chloroform extracts to dryness on a water bath. Dissolve the residue in 50 ml of 75% neutral methanol (neutral to phenolphthalein IS), add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS; the volume of sodium hydroxide (0.1 mol/L) VS consumed is not more than 2.2 ml (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals Dissolve naproxen sodium in 20 ml of water in a separator, add 5 ml of 1 mol/L hydrochloric acid solution. Extract with 20 ml, 20 ml and 10 ml of dichloromethane separately and discard the dichloromethane layer. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using the aqueous layer extracts: not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml of glacial acetic acid, add 1 drop of crystal violet TS, titrate with perchloric acid (0.1 mol/L) VS until the colour of solution changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.22 mg of $C_{14}H_{13}NaO_3$.

Category A non-inflammatory analgesic, antipyretic.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Preparation Naproxen Sodium Tablets**Naproxen Sodium Tablets**

Naproxen Sodium Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of naproxen sodium ($C_{14}H_{13}NaO_3$).

Description White or almost white tablets.

Identification (1) Shake a quantity of powdered tablets equivalent to about 250 mg of naproxen sodium with 12 ml of water, add 1 ml of hydrochloric acid; a white precipitate is produced. Filter, the filtrate yields the reactions characteristic of sodium (Appendix III).

(2) Shake the precipitate obtained in Identification test (1) with 10 ml of chloroform, filter, and dilute 1 ml of the filtrate to 50 ml with chloroform. The light absorption of the resulting solution exhibits maxima and minima in the range of 200-400 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powder, equivalent to about 275 mg of naproxen sodium, in a 100 ml volumetric flask, add about 70 ml of methanol, shake thoroughly for 30 minutes to dissolve naproxen sodium, dilute with methanol to volume, mix well and filter. Transfer 2 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask, dilute with methanol to volume and shake well. Measure the absorbance of the resulting solution at 332 nm (Appendix IV A). Repeat the operation, using a solution containing 55 μ g of naproxen sodium CRS per ml, in methanol in the same manner. Calculate the content of $C_{14}H_{13}NaO_3$.

Category As described under Naproxen Sodium.

Strength (1) 0.1 g (equivalent to 91 mg of naproxen)
(2) 0.275 g (equivalent to 250 mg of naproxen)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Nefopam Hydrochloride

$C_{17}H_{19}NO \cdot HCl$ 289.20

[23327-57-3]

Nefopam Hydrochloride is 5-methyl-1-phenyl-3,4,5,6-tetrahydro-1H-2,5-benzoxazocine hydrochloride. It contains not less than 98.5% of $C_{17}H_{19}NO \cdot HCl$, calculated on the dried basis.

Description White crystalline powder; odourless; taste, slightly bitter.

Sparingly soluble in water, slightly soluble in ethanol, insoluble in benzene.

Identification (1) To about 10 mg, add 1 ml of sulfuric acid; the solution becomes orange red, and changes to purplish red on adding 1 drop of nitric acid; To another portion of about 10 mg, add 1 ml of sulfuric acid and 1 drop of formaldehyde, a brown colour is produced.

(2) The light absorption of the solution of 0.15 mg per ml in dehydrated ethanol exhibits maximum at 266 nm and 274 nm (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nefopam hydrochloride (Appendix XVI).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in test for residue on ignition, not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, with 10 ml of glacial acetic acid, on warming, cool, add 5 ml of 5% mercuric acetate solution and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.98 mg of $C_{17}H_{19}NO \cdot HCl$.

Category Analgesic agent.

Storage Preserve in tightly closed containers, stored in dry place.

Preparation (1) Nefopam Hydrochloride Injection
(2) Nefopam Hydrochloride Tablets

Nefopam Hydrochloride Injection

Nefopam Hydrochloride Injection is a sterile solution of Nefopam hydrochloride in water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nefopam hydrochloride ($C_{17}H_{19}NO \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To 0.5 ml, add 1 drop of Potassium iodide TS or mercuric chloride TS, a white precipitate is produced.

(2) Yields the reactions characteristic of chlorides (Appendix III).

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity, equivalent to about 20 mg of nefopam hydrochloride, to a 100 ml volumetric flask, dilute with dehydrated ethanol to a volume and mix well. Measure the absorbance at 267 nm (Appendix VI A), then weigh accurately 20 mg of the nefopam hydrochloride CRS proceed in the same manner. Calculate the content of $C_{17}H_{19}NO \cdot HCl$.

Category As described under Nefopam Hydrochloride.

Strength 1 ml:20 mg

Storage Preserve in well closed containers, protected from light.

Nefopam Hydrochloride Tablets

Nefopam Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nefopam hydrochloride ($C_{17}H_{19}NO \cdot HCl$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets, equivalent to about 10 mg of nefopam hydrochloride, add 1 ml of sulfuric acid, a yellow colour is produced, then add 1 drop of nitric acid, the colour changes to red.

(2) To a quantity of the powdered tablets, equivalent to about 10 mg of nefopam hydrochloride, add 1 ml of sulfuric acid and 1 drop of formaldehyde solution, a brown colour is produced.

(3) Dissolve a quantity of the powdered tablets with ethanol to produce a solution of 0.15 mg per ml and filter. The light absorption of the successive filtrate exhibits maxima at 266 nm and 274 nm (Appendix IV A).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Dissolution Comply with the dissolution test (Appendix X C, method 2), using 1000 ml water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of solution after exactly 45 minutes and filter. Take the successive filtrate as test solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L heptane sulfonate solution (adjust with dilute phosphoric acid to pH 3.0)-acetonitrile (67:33) as the mobile phase. Detection wavelength is 215 nm and the number of theoretical plates of the column is not less than 2000. Inject 20 μ l of the test solution into the column, accurately measured, record the chromatogram. Repeat the operation, dissolve a quantity of nefopam hydrochloride CRS, weighed accurately, in water to produce a solution of 0.02 mg per ml. Calculate the dissolution of $C_{17}H_{19}NO \cdot HCl$ from each tablet, with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. Dissolve a quantity of the powdered tablets equivalent to about 0.12 g of nefopam hydrochloride, accurately weighed, with 20 ml of glacial acetic acid, on warming. Cool, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.95 mg of $C_{17}H_{19}NO \cdot HCl$.

Category As described under Nefopam Hydrochloride.

strength 20 mg

storage Preserve in tightly closed containers, protected from light.

Neomycin Sulfate

Neomycin Sulfate has a potency of not less than 650 neomycin Units per mg, calculated on the dried basis.

Description A white, or almost white powder; odourless; hygroscopic. The aqueous solution is dextro-rotatory. Very soluble in water; practically insoluble in ethanol, ether, acetone or chloroform.

Identification (1) Dissolve 10 mg in 1 ml of water, add 2 ml of hydrochloric acid solution (9→100), heat in a water bath for 10 minutes, add 2 ml of 8% sodium hydroxide solution and 1 ml of a 2% solution of acetylacetone in water, heat in a water bath for further 5 minutes. Allow to cool, add 1 ml of p-dimethylaminobenzaldehyde TS; a cherry red colour is produced.

(2) Carry out the method for thin layer chromatography (Appendix V B), using silica gel H as the coating substance (prepared by mixing 1.5 g of silica gel H with 6 ml of a 0.25% solution of carboxymethylcellulose sodium), and a mixture of methanol-ethyl acetate-acetone-8.8% ammonium acetate solution (25:15:10:40) as the mobile phase. Apply separately to the plate 1 μ l each of two solutions in water containing (1) 20 mg per ml of the substance being examined and (2) 20 mg per ml of neomycin sulfate RS. After developing and removal of the plate, allow it to dry in air and then heat at 110°C for 20 minutes, spray the hot plate with a 10% solution of sodium hypochlorite, dry in a current of cold air and again spray with starch-potassium iodide solution (100 ml of a 0.5% starch solution containing 0.5 g of potassium iodide) and examine immediately. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of neomycin CRS.

(4) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity An aqueous solution of 0.1 g per ml, pH 5.0-7.0 (Appendix VI H).

Sulfate Dissolve 0.16 g, accurately weighed, in 100 ml of water, and adjust pH value to 11 using concentrated ammonia solution. Add 10.0 ml of barium chloride (0.1 mol/L) VS and 5 drops of phthalein purple IS. Titrate with disodium edetate (0.05 mol/L) VS, make sure to keep pH value 11 during the period of titration. Add 50 ml of ethanol when the colour of the solution begins to change and continue the titration until the blue purple colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of sulfate (SO_4). The content of sulfate is 27.0%-31.0%, calculated on the dried basis.

Neamine Carry out the method for thin layer chromatography described under the test (2) for Identification, Applying two solutions in water containing (1) 20 mg per ml of the substance being examined and (2) 0.4 mg of neamine RS per ml. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight at 60°C, loses not more than 6.0% of its weight (Appendix VII L).

Residue on ignition Not more than 1.0% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Neomycin Units are equivalent to 1 mg of

Neomycin.

Category Aminoglycosides.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Neomycin Sulfate Eye Drops
(2) Neomycin Sulfate Tablets
(3) Compound Neomycin Ointment

Neomycin Sulfate Eye Drops

Neomycin Sulfate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of neomycin.

Description A clear, colourless to pale yellow liquid.

Identification Comply with the tests (1), (2) and (4) for Identification described under Neomycin Sulfate.

pH value 6.0-7.0 (Appendix VI H).

Colour The solution is colourless; any colour produced is not more intense than that of the reference solution Y₃ (Appendix IX A, Method 1).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Measure accurately a quantity, carry out the method described under Neomycin Sulfate.

Category As described under Neomycin Sulfate.

Strength 8 ml (40000 Units)

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Neomycin Sulfate Tablets

Neomycin Sulfate Tablets contain not less than 93.0% and not more than 107.0% of the labelled potency of neomycin.

Description White tablets.

Identification To a quantity of powdered tablets add water to produce a suspension containing 20 mg of neomycin per ml and filter. The filtrate complies with the tests (1), (2) and (4) for Identification described under Neomycin Sulfate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 0.25 g of neomycin in sterile water to produce a suspension of 1000 Units per ml and shake thoroughly. Allow to stand, measure accurately a quantity of the suspension liquid and carry out the Assay described under Neomycin Sulfate.

Category As described under Neomycin Sulfate.

Strength (1) 0.1 g (100000 Units)
(2) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Compound Neomycin Ointment

Compound Neomycin Ointment contains not less than 90.0% and not more than 120.0% of the labelled potency of neomycin sulfate and bacitracin.

Formula	Neomycin Sulfate	2000000 Units
	Bacitracin	250000 Units
	Liquid Paraffin	a sufficient quantity
	Vaseline	a sufficient quantity

to produce 1000 g

Description A pale yellow to yellow ointment.

Identification Dissolve about 1 g of the ointment with 20 ml of ether by shaking and extract with 2 ml of water in a separator. Take the aqueous layer as solution (1). Dissolve a quantity of neomycin RS and bacitracin RS, respectively, with water to produce solution (2) 1000 Units of neomycin per ml and (3) 125 Units of bacitracin. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of methanol-ethyl acetate-acetone-8.8% ammonium acetate solution (25 : 15 : 10 : 40) as the mobile phase. Apply separately to the plate 5 µl each of above three solutions, after developing and removal of the plate, dry it in air, spray with *n*-butanol-pyridine (99 : 1) containing 1% of ninhydrin. The colour and position of the two principal spots in the chromatogram obtained with solution (1) correspond to the principal spots obtained with solution (2) and (3).

Other requirements Comply with the general requirements for ointments (Appendix I F).

Assay Neomycin Weigh accurately about 2 g, shake in a separator with 50 ml of ether and extract with four quantities of 20 ml of phosphate BS (pH 7.8) containing 3% of sodium chloride. Dilute the combined extracts to 100 ml with the buffer solution, mix well, and carry out the Microbiological Assay of Antibiotics (Appendix XI A). It is necessary to add bacitracin RS according to the formula when prepare the neomycin reference solution.

Bacitracin Weigh accurately about 2 g, shake in a separator with 50 ml of ether and extract with four quantities of 20 ml of phosphate BS (pH 6.0). Dilute the combined extracts to 100 ml with the buffer solution, mix well and carry out the Microbiological Assay of Antibiotics (Appendix XI A).

Category Antibiotic.

Storage Preserve in well closed containers, stored in a dry and cool place.

Neostigmine Bromide

C₁₂H₁₉BrN₂O₂ 303.20

[114-80-7]

Neostigmine Bromide is 3-[(dimethylamino)-carbonyl]oxy-N,N,N-trimethyl benzenaminium bromide. It contains not less than 98.0% of

$C_{12}H_{19}BrN_2O_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste bitter.

Very soluble in water; freely soluble in ethanol or chloroform; practically insoluble in ether.

Melting range 171-176°C, with decomposition (Appendix VI C).

Identification (1) To about 1 mg in an evaporating dish, add 1 ml of 20% sodium hydroxide solution and 2 ml of water, then evaporate to dryness on a water bath. Dissolve the residue in 1 ml of water, cool and add 1 ml of diazotized sulfanilic acid TS; a red colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of neostigmine bromide (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Sulfate Dissolve 0.25 g in 10 ml of water, add 1 ml of dilute hydrochloric acid and 2 ml of barium chloride TS; no turbidity is produced.

Extraneous absorbance Measure the absorbance of a solution of 5.0 mg per ml in 1.0% sodium carbonate solution at 294 nm (Appendix IV A), the absorbance is not greater than 0.25.

Loss on drying When dried to constant weight at 105°C loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 30.32 mg of $C_{12}H_{19}BrN_2O_2$.

Category Anticholinesterase agent.

Storage Preserve in tightly closed containers.

Preparation Neostigmine Bromide Tablets

Neostigmine Bromide Tablets

Neostigmine Bromide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of neostigmine bromide ($C_{12}H_{19}BrN_2O_2$).

Description White tablets.

Identification Macerate a quantity of the powdered tablets equivalent to about 0.1 g neostigmine bromide with successive quantities 10 ml each of ethanol and filter the combined ethanol extracts. Evaporate the filtrate to dryness on a water bath. The residue complies with tests (1) and (3) for Identification described under Neostigmine Bromide.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 40 tablets. Dissolve an accurately weighed quantity of the powder, equivalent to about 0.2 g of neostigmine bromide, in a 100 ml volumetric flask with a quantity of water on shaking, add sufficient water to volume and mix well. Filter, discard the initial filtrate and transfer 50 ml, measured accurately, of the successive filtrate to a Kjeldahl flask. Add 40 ml of water,

100 ml of sodium hydroxide TS and distil. Collect the distillate in 50 ml of 2% boric acid solution until the volume is about 150 ml. Add 6 drops of methyl red-bromocresol green IS, titrate with sulfuric acid (0.01 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 6.064 mg of $C_{12}H_{19}BrN_2O_2$.

Category As described under Neostigmine Bromide.

Strength 15 mg

Storage Preserve in tightly closed containers.

Neostigmine Methylsulfate

$C_{13}H_{22}N_2O_6S$ 334.39

[51-60-5]

Neostigmine Methylsulfate is 3-(dimethylcarbamoyloxy-*N,N,N*-trimethylanilinium methylsulfate. It contains not less than 98.0% of $C_{13}H_{22}N_2O_6S$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter; hygroscopic.

Very soluble in water; freely soluble in ethanol.

Melting range 143-149°C (Appendix VI C).

Identification (1) To about 1 mg in an evaporating dish add 1 ml of 20% sodium hydroxide solution and 2 ml of water, evaporate to dryness on a water bath and heat at 250°C for about half minute. Dissolve the residue in 1 ml of water cool and add 1 ml of diazotized sulfanilic acid TS; a red colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of neostigmine methylsulfate (Appendix XVI).

(3) To about 20 mg add 1 ml of 20% sodium hydroxide solution and 10 drops of strong hydrogen peroxide solution, heat to boil. Cool, acidify the solution with dilute hydrochloric acid and add barium chloride TS; a white precipitate is produced.

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, add 2 drops of phenolphthalein IS, no pink colour is produced; add 0.20 ml of sodium hydroxide (0.02 mol/L) VS, a pink colour is produced.

Chloride Dissolve 0.2 g in 10 ml of water, add 1 ml of dilute nitric acid and 3 ml of silver nitrate TS, no turbidity is immediately produced.

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 0.5 g. Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.06%).

Light absorption of impurity Dissolve an accurately weighed quantity in 1.0% sodium carbonate solution to produce a solution of 5.0 mg per ml. Measure the absorbance of the resulting solution at 294 nm (Appendix IV A); not greater than 0.15.

Readily oxidizable substances Dissolve 0.1 g in 1.0 ml of freshly boiled and cooled water, add 0.5 ml of potassium permanganate (0.001 mol/L) VS, the colour remains unfaded for 30 seconds.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.15 g, accurately weighed, in 9 ml of water in a Kjeldahl flask, add 100 ml of sodium hydroxide TS and distil. Collect the distillate in 50 ml of 2% boric acid solution until the total volume reaches 150 ml. To the solution add 6 drops of a mixture of methyl red and bromocresol green IS, titrate with sulfuric acid (0.01 mol/L) VS until the solution changes from bluish green to greyish violet. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 6.688 mg of $C_{13}H_{22}N_2O_6S$.

Category Antinergic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Neostigmine Methylsulfate Injection

Neostigmine Methylsulfate Injection

Neostigmine Methylsulfate Injection is a sterile solution of Neostigmine Methylsulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of neostigmine methylsulfate ($C_{13}H_{22}N_2O_6S$).

Description A clear, colourless liquid.

Identification (1) Complies with test (1) for Identification described under Neostigmine Methylsulfate, using 2 ml.

(2) Evaporate 20 ml to dryness, the residue complies with test (3) for Identification described under Neostigmine Methylsulfate.

pH value 5.0-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 10 mg of neostigmine methylsulfate, carry out the method for determination of nitrogen (Appendix VII D, method II). Transfer the injection to the semi-micro Kjeldahl apparatus, add 5 ml of 40% sodium hydroxide solution and distil slowly. Collect the distillate in 5 ml of 2% boric acid solution until the total volume reaches about 70 ml. Titrate with sulfuric acid (0.005 mol/L) VS on adding 6 drops of methylred-bromocresol green IS, until the solution becomes greyish-violet. Perform a blank determination and make any necessary correction. Each ml of sulfuric acid (0.005 mol/L) VS is equivalent to 3.344 mg of $C_{13}H_{22}N_2O_6S$.

Category As described under Neostigmine Methylsulfate.

Strength 1 ml; 0.5 mg

Storage Preserve in well closed containers, protected from light.

Netilmicin Sulfate

$(C_{21}H_{41}N_5O_7)_2 \cdot 5H_2SO_4$ 1441.54 [56391-57-2]

Netilmicin Sulfate is *O*-3-Deoxy-4-*C*-methyl-3-(methylamino)- β -L-arabinopyranosyl-(1 \rightarrow 4)-*O*-[2,6-diamino-2,3,4,6-tetradeoxy- α -D-glycero-hex-4-enopyranosyl-(1 \rightarrow 6)]-2-deoxy-*N*³-ethyl-L-streptamine sulfate (2:5) (salt). It has a potency of not less than 610 netilmicin Units per mg, calculated on the anhydrous basis.

Description A white or almost white powder or loose mass; odourless; taste, slightly bitter; hygroscopic. Freely soluble in water; insoluble in ethanol, chloroform or ether.

Specific optical rotation +88° to +96°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B) described under Related substances. Apply separately to the plate 2 μ l each of three solutions in water containing (1) 3 mg per ml of the substance being examined, (2) 3 mg per ml of netilmicin RS, and (3) 1.5 mg per ml of each of the substance being examined and netilmicin RS. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that in the chromatogram obtained with solution (2), and the solution (3) shows only one principal spot.

(2) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity Dissolve a quantity in water to produce a solution containing 40 mg per ml, pH 3.5-5.5 (Appendix VI H).

Clarity and colour of solution Dissolve 700 mg each of 5 portions in 5 ml water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Sulfate Dissolve about 0.12 g, accurately weighed, in 100 ml of water, adjust pH value to 11 with concentrated ammonia solution, add accurately 10 ml of barium chloride (0.1 mol/L) VS and 5 drops of phthalein purple IS. Titrate with disodium edetate (0.05 mol/L) VS, keep pH 11 during the period of titration. When the purple colour of the solution begins to discolour slightly add 50 ml of ethanol and continue titration until the purple colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 9.606 mg of sulfate (SO_4). The content of sulfate is not less than 31.5% and not more than 35.0%, calculated on the

anhydrous basis.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-concentrate ammonia solution (4 : 4 : 2) as the mobile phase. Apply separately to the plate 2 μ l each of four solutions in water containing (1) 150 mg per ml of the substance being examined, (2) 1.5 mg per ml of netilmicin RS, (3) 3 mg per ml of netilmicin RS, and (4) 1.44 mg per ml of sisomicin RS. After developing and removal of the plate, allow it to dry in air and spray with a 0.2% solution of ninhydrin in *n*-butanol saturated with water, heat at 110°C for 20 minutes. The sisomicin spot in the chromatogram obtained with solution (1) are not more intense than the principal spot obtained with solution (4) (1%). Any other secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (1%) and not more than one such spot may be more intense than the principal spots obtained with solution (3) (2%).

Water Not more than 15.0% (Appendix VIII M, method 1).

Residue on ignition Not more than 1.0% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 1.25 EU per 1000 Netilmicin Units.

Assay Carry out the Microbiological assay of antibiotics (Appendix XI A), using a solution of about 1000 Units per ml in phosphate BS (pH 7.8). The fiducial limit is not more than 7%. 1000 Netilmicin Units is equivalent to 1 mg of $C_{21}H_{41}N_5O_7$.

Category Aminoglycosides antibiotic.

Storage Preserve in tightly closed containers, stored at a temperature below -6°C.

Preparation Netilmicin Sulfate Injection

Netilmicin Sulfate Injection

Netilmicin Sulfate Injection is a sterile solution of netilmicin sulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of netilmicin ($C_{21}H_{41}N_5O_7$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with the tests for Identification described under Netilmicin Sulfate.

pH value 5.0-7.0 (Appendix VI H).

Colour The solution is colourless; any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Sterility Dilute each vial with not less than 500 ml of 0.9% sterile Sodium Chloride Injection, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Bacterial endotoxin Complies with the corresponding requirements described under Netilmicin Sulfate.

Other requirements Complies with the general requirements

for injection (Appendix I B).

Assay Measure accurately a quantity and carry out the Assay described under Netilmicin Sulfate.

Category As described under Netilmicin Sulfate.

Strength (1) 1 ml : 50000 Units
(2) 2 ml : 100000 Units

Storage Preserve in well closed containers, stored in a cool place.

Nicardipine Hydrochloride

$C_{26}H_{29}N_3O_6 \cdot HCl$ 515.99

[54527-84-3]

Nicardipine Hydrochloride is 2,6-dimethyl-4-(3-nitro-phenyl)-1,4-dihydropyridine-3,5-dicarboxylic acid, 3-[β -(*N*-benzyl-*N*-methylamino)]ethyl ester-5-methyl ester hydrochloride. It contains not less than 98.5% of $C_{26}H_{29}N_3O_6 \cdot HCl$, calculated on the dried basis.

Description A pale yellow powder or yellow crystalline powder; odourless; almost tasteless. Soluble in methanol; sparingly soluble in ethanol or chloroform; practically insoluble in water or ether; soluble in glacial acetic acid.

Melting range 179-185°C, with decomposition (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 8 μ g per ml in methanol at 236 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 507-539.

Identification (1) Dissolve about 10 mg in 3 ml of methanol, add a few drops of ammonium reineckate TS, a pink precipitate is produced.

(2) The light absorption of the solution obtained in the Specific absorbance exhibits a maximum at 236 nm and a minimum at 219 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nicardipine hydrochloride (Appendix XVI).

(4) Dissolve about 10 mg in 4 ml of methanol, the solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-benzene-methanol (5:4:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in methanol containing (1) 6.5 mg per ml, (2) 0.065 mg per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve 0.4 g, accurately weighed, in 20 ml of glacial acetic acid and 6 ml of mercuric acetate TS by warming, allow to cool, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction, each ml of perchloric acid (0.1 mol/L) VS is equivalent to 51.60 mg of $C_{26}H_{29}N_3O_6 \cdot HCl$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Nicardipine Hydrochloride and Glucose Injection
(2) Nicardipine Hydrochloride Injection
(3) Nicardipine Hydrochloride Tablets

Nicardipine Hydrochloride and Glucose Injection

Nicardipine Hydrochloride and Glucose Injection is a sterile solution of Nicardipine Hydrochloride and Glucose in Water for Injections. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nicardipine hydrochloride ($C_{26}H_{29}N_3O_6 \cdot HCl$); and not less than 95.0% and not more than 105.0% of the labelled amount of glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless or slightly yellowish-green liquid.

Identification (1) To a quantity, add dropwise hot alkaline cupric tartrate TS, a red precipitate of cuprous oxide is produced.
(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the reference solution.

pH value 3.2-5.0 (Appendix VI H).

Colour The colour of the injection is not more intense than that of reference solution YG₄ (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Carry out the method as described under Assay. Dissolve a quantity of the injection, accurately measured, in mobile phase to produce the test solution containing nicardipine hydrochloride of 50 µg per ml and the reference solution of 2 µg per ml. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chart. Inject separately 20 µl of the test solution and the reference solution into the column, record the chromatogram for 4 times of the retention time of the principal peak. The area of single peak other than the principal peak in the chromatogram obtained with the test solution is not greater than 1/2 of the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Heavy metals Measure a quantity of the injection (equivalent to about 3 g of glucose), evaporate to about 20 ml and cool. Add 2 ml of acetate BS (pH 3.5) and a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%, calculated with reference to the contents of glucose.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml per kg of rabbit's weight, inject slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Nicardipine hydrochloride Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (72:28) as the mobile phase. Detection wavelength is 236 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of nicardipine hydrochloride.

Procedure Protect from light throughout the procedure. Transfer an accurately measured quantity of the injection, dilute with the mobile phase to produce a solution of 50 µg of nicardipine hydrochloride per ml. Inject 20 µl of the resulting solution into the column and record the chromatogram. Dissolve about 50 mg of nicardipine hydrochloride CRS, accurately weighed, with 3 ml of methanol in a 100 ml volumetric flask and dilute with water to volume, mix well. Transfer 10 ml of the solution into a 100 ml volumetric flask, accurately measured, dilute with the mobile phase to volume, mix well, repeat the operation. Calculate the content of $C_{26}H_{29}N_3O_6 \cdot HCl$.

Glucose Measure a quantity of the injection, carry out the determination of optical rotation (Appendix VI E), the observed rotation in degree multiplied by 2.0852, represents the weight in g of $C_6H_{12}O_6 \cdot H_2O$ in the volume taken for Assay.

Category Calcium channel blocker.

Strength 100 ml: 10 mg of nicardipine hydrochloride and 5.5 g of glucose

Storage Stored in cool place, protected from light.

Nicardipine Hydrochloride Injection

Nicardipine Hydrochloride Injection is a sterile solution of Nicardipine Hydrochloride in Water for Injections. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nicardipine hydrochloride ($C_{26}H_{29}N_3O_6 \cdot HCl$).

Description A clear, pale yellowish-green liquid.

Identification (1) To 4 ml, add drops of ammonium reineckate TS, a pink precipitate is produced.
(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 236 nm, and a minimum at 219 nm (Appendix IV A).
(3) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the reference solution.
(4) Yield the reactions characteristic of chlorides (Appendix III).

pH value 3.5-5.0 (Appendix VI H).

Colour The colour of the injection is not more intense than

that of reference solution YG₃ (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, accurately measured, in mobile phase to produce a solution of 50 µg of nicardipine hydrochloride per ml as test solution and a solution of 2 µg of nicardipine hydrochloride per ml as reference solution. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chart. Inject separately 20 µl of the test solution and the reference solution into the column, record the chromatogram for 4 times of the retention time of the principal peak. The area of single peak other than the principal peak in the chromatogram obtained with the test solution is not greater than 1/2 of the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 5 EU per 1 mg of nicardipine hydrochloride.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.01 mol/L potassium dihydrogen phosphate solution (72:28) as mobile phase. Detection wavelength is 236 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of nicardipine hydrochloride. The resolution factor between the peaks of nicardipine hydrochloride and neighboring impurity complies with the related requirements.

Procedure Protect from light throughout the procedure. Transfer an accurately measured quantity of the injection, dilute with the mobile phase to produce a solution of 50 µg of nicardipine hydrochloride per ml. Inject 20 µl of the resulting solution into the column and record the chromatogram; Weigh accurately a quantity of nicardipine hydrochloride CRS, repeat the operation. Calculate the content of C₂₆H₂₉N₃O₆ · HCl.

Category As described under Nicardipine Hydrochloride.

Strength (1) 2 ml:2 mg (2) 5 ml:5 mg
(3) 10 ml:10 mg

Storage Stored in cool place, protected from light.

Nicardipine Hydrochloride Tablets

Nicardipine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nicardipine hydrochloride (C₂₆H₂₉N₃O₆ · HCl).

Description Pale yellow tablets or sugar coated tablets.

Identification (1) To a quantity of the powdered tablets equivalent to 20 mg of nicardipine hydrochloride add 8 ml of methanol to dissolve nicardipine hydrochloride, filter, the filtrate complies with the test (1) and (4) for Identification described under Nicardipine Hydrochloride.
(2) The light absorption of the solution obtained in the

Assay exhibits a maximum at 236 nm and a minimum at 219 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powder equivalent to about 15 mg of nicardipine hydrochloride in a 100 ml volumetric flask add 80 ml of methanol, shake for 30 minutes to dissolve nicardipine hydrochloride, dilute to volume, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with methanol to volume and mix well. Measure the absorbance of the resulting solution at 236 nm (Appendix IV A), calculate the content of C₂₆H₂₉N₃O₆ · HCl, taking 523 as the value of A (1%, 1 cm).

Category, Storage As described under Nicardipine Hydrochloride.

Strength 10 mg

Niclosamide

C₁₃H₈Cl₂N₂O₄ 327.12

[50-65-7]

Niclosamide is 5-chloro-N-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide. It contains not less than 98.0% of C₁₃H₈Cl₂N₂O₄, calculated on the dried basis.

Description A pale yellow powder; tasteless. Slightly soluble in ethanol, chloroform or ether; practically insoluble in water.

Melting point 228-232°C (Appendix VI C).

Identification (1) Heat 50 mg with 5 ml of hydrochloric acid solution (9→100) and 0.1 g of zinc powder on a water bath for 10 minutes, cool and filter. To the filtrate add 0.5 ml of sodium nitrite TS, mix, and allow to stand for 10 minutes; add 2 ml of 2% ammonium sulphamate solution, shake, allow to stand for 10 minutes and add 2 ml of 0.5% N-(1-naphthyl) ethylenediamine dihydrochloride solution; a deep red colour is produced.

(2) Heat to decompose a quantity in a test tube with a small flame. Dissolve the sublimate in water, add a few drops of ferric chloride TS; a violet colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of niclosamide (Appendix XVI).

(4) Carry out the method for oxygen flask combustion with 20 mg (Appendix VII C), using 5 ml of 10% sodium hydroxide solution as the absorbing liquid. The resulting solution yields the reactions characteristic of chlorides (Appendix III).

Chloride Boil 0.50 g with 50 ml of water, cool rapidly and filter. Carry out the limit test for chlorides (Appendix VII A), using 25 ml of filtrate. Any opalescence produced is not more pronounced than that of a reference using 10 ml of sodium chloride standard solution (0.04%).

2-Chloro-4-nitroaniline Boil 0.10 g with 20 ml of methanol for 2 minutes, cool, add sufficient hydrochloric acid solution

(9→100) to produce 50 ml and filter. To 10 ml of filtrate add 5 drops of sodium nitrite TS, mix and allow to stand for 10 minutes; add 1 ml of 2% ammonium sulphamate solution, shake, allow to stand for another 10 minutes and add 1 ml of 0.5% *N*-(1-naphthyl) ethylenediamine hydrochloride solution. The colour produced is not more intense than that of the reference solution prepared in similar manner using 10 µg of 2-chloro-4-nitroaniline CRS dissolved in 4 ml of methanol and sufficient quantity of hydrochloric acid solution (9→100) to produce 10 ml (0.05%).

5-Chlorosalicylic acid Dissolve 0.5 g in 10 ml of water, boil for two minutes, cool and filter. To the filtrate add a few drops of ferric chloride TS; no red or violet colour is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 60 ml of dimethylformamide, carry out the method for Potentiometric Titration (Appendix VII A), titrate with sodium methoxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 32.71 mg of $C_{13}H_8Cl_2N_2O_4$.

Category Anthelmintic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Niclosamide Tablets

Niclosamide Tablets

Niclosamide Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of niclosamide ($C_{13}H_8Cl_2N_2O_4$).

Description Pale yellow tablets.

Identification Boil 1 tablet, finely powdered, with 25 ml of ethanol, cool and filter. Evaporate the filtrate on a water bath to dryness, the residue complies with tests (1), (2) and (4) for the Identification described under Niclosamide.

2-Chloro-4-nitroaniline and 5-chlorosalicylic acid Comply with the tests described under Niclosamide.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and finely powder 20 tablets. Carry out the determination of nitrogen (Appendix VII D, method 1), using a quantity, accurately weighed, of powdered tablets equivalent to about 0.3 g of Niclosamide. Each ml of sulphuric acid (0.05 mol/L) VS is equivalent to 16.36 mg of $C_{13}H_8Cl_2N_2O_4$.

Category As described under Niclosamide.

Strength 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Nicotinamide

$C_6H_6N_2O$ 122.13

[98-92-0]

Nicotinamide is 3-pyridinecarboxamide. It contains not less than 98.5% of $C_6H_6N_2O$, calculated on the dried basis.

Description A white crystalline powder; odourless or almost odourless; taste, bitter.

Freely soluble in water or ethanol; soluble in glycerin.

Melting point 128-131°C (Appendix VI C).

Identification (1) Dissolve 0.1 g in 5 ml of water, add 5 ml of sodium hydroxide TS, boil gently, an ammonia odour is evolved (distinction from nicotinic acid); heat continuously until no ammonia odour is evolved, cool, add 1-2 drops of phenolphthalein IS, neutralize with dilute sulfuric acid, then add 2 ml of cupric sulfate TS; a light blue precipitate is produced. Filter and ignite the precipitate, a pyridine odour is evolved.

(2) The light absorption of a solution of about 20 µg per ml exhibits a maximum at 262 nm and a minimum at 245 nm; the ratio of the absorption at 245 nm to that at 262 nm is 0.63-0.67 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nicotinamide (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of chloroform-dehydrated ethanol-water (48 : 45 : 4) as the mobile phase. Apply separately to the plate 5 µl each of two solutions of the substance being examined in ethanol containing (1) 40 mg per ml, (2) 0.2 mg per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Acidity and alkalinity Dissolve 1.0 g in 10 ml of water, pH 5.5-7.5 (Appendix VI H).

Loss on drying When dried at 105°C for 2 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 10 ml of water, add 6 ml of hydrochloric acid solution (1 mol/L) and sufficient water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve 0.1 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of acetic anhydride and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until a bluish green colour is produced. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.21 mg of $C_6H_6N_2O$.

Category Vitamin.

Storage Preserve in tightly closed containers, protected

from light.

Preparation (1) Nicotinamide Injection
(2) Nicotinamide Tablets

Nicotinamide Injection

Nicotinamide Injection is a sterile solution of nicotinamide in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of nicotinamide ($C_6H_6N_2O$).

Description A colourless clear liquid.

Identification A quantity of injection equivalent to 0.2 g of nicotinamide complies with the tests (1) and (2) for Identification described under Nicotinamide.

pH value 5.5-7.5 (Appendix VI H).

Other requirements Complies with the general requirements j (pp - B).

Assay Dilute an accurately measured quantity of injection, with hydrochloric acid solution (9 → 1000) to produce a solution of about 15 µg per ml. Measure the absorbance at 261 nm (Appendix IV A). Calculate the content of nicotinamide, taking 430 as the value of A (1%, 1 cm).

Category As described under Nicotinamide.

Strength (1) 1 ml:50 mg (2) 1 ml:100 mg

Storage Preserve in well closed containers, protected from light.

Nicotinamide Tablets

Nicotinamide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of nicotinamide ($C_6H_6N_2O$).

Description White tablets.

Identification (1) Stir a quantity of powdered tablets equivalent to 0.2 g of nicotinamide with 10 ml of water and filter. The filtrate complies with the test (1) for Identification described under Nicotinamide.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 261 nm (Appendix IV A).

Related substances Add 15 ml of dehydrated ethanol to a quantity equivalent to 0.1 g of nicotinamide, shake for 15 minutes and filter. Evaporate the filtrate on a water bath to dryness, dissolve the residue with 2.5 ml of ethanol and mix well as solution (1). Dilute 1 ml of solution (1) with dehydrated ethanol to 200 ml as solution (2). Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of chloroform-dehydrated ethanol-water (48 : 45 : 4) as the mobile phase. Apply separately to the plate 5 µl each of solution (1) and solution (2). After developing a distance of 10 cm and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principle spot obtained with solution (2).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powdered tablets equivalent to 60 mg of

nicotinamide, accurately weighed, in 100 ml volumetric flask add 75 ml of hydrochloric acid solution (9 → 1000), heat on a water bath for 15 minutes and shake constantly to dissolve nicotinamide. Cool to room temperature, dilute with hydrochloric acid solution (9 → 1000) to volume and mix well. Filter and discard the initial filtrate, measure accurately 5 ml of the successive filtrate to 200 ml volumetric flask, dilute with hydrochloric acid solution (9 → 1000) to volume and mix well. Measure the absorbance at 261 nm (Appendix IV A). Calculate the content of nicotinamide, taking 430 as the value of A (1%, 1 cm).

Category As described under Nicotinamide.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Nicotinic Acid

$C_6H_5NO_2$ 123.11

[59-67-6]

Nicotinic Acid is 3-pyridinecarboxylic acid. It contains not less than 99.0% of $C_6H_5NO_2$, calculated on the dried basis.

Description A white crystal or crystalline powder; odourless or with a slight odour; taste, feebly acid; aqueous solution yields an acid reaction.

Soluble in boiling water or boiling ethanol; sparingly soluble in water; slightly soluble in ethanol; practically insoluble in ether; freely soluble in solutions of alkali carbonates and hydroxides.

Melting range 234-238°C (Appendix VI C).

Identification (1) Triturate 4 mg with 8 mg of 2,4-dinitrochlorobenzene, transfer the mixture into a test tube, heat gently to molten and continue the heating for a few seconds. Allow to cool, add 3 ml of ethanolic potassium hydroxide TS; a violet-red colour is produced.

(2) Dissolve 50 mg in 20 ml of water, add 0.4% sodium hydroxide solution dropwise, until the solution is neutral to litmus paper add 3 ml of cupric sulfate TS; a blue precipitate is produced slowly.

(3) The light absorption of a solution of 20 µg per ml exhibits a maximum at 262 nm and a minimum at 237 nm; the ratio of the absorbance at 237 nm to that at 262 nm is 0.35-0.39 (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nicotinic acid (Appendix XVI).

Colour of solution Dissolve 1.0 g in 10 ml of sodium hydroxide TS, the solution is not more intensely coloured than an equal volume of a reference solution prepared by mixing 0.15 ml of cobaltous chloride CS, 1.7 ml of potassium dichromate CS, 0.15 ml of cupric sulfate CS, and dilute with water to 100 ml.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII

B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of potassium sulfate standard solution (0.02%).

Loss on drying When dried at 105°C for 1 hour, loses not more than 0.5% of its weight (Appendix VII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Heavy metals To 1.0 g add 1.5 ml of dilute hydrochloric acid and sufficient water to 25 ml, heat gently to dissolve and cool to room temperature. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve 0.3 g, accurately weighed, in 50 ml of freshly boiled and cooled water, add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 12.31 mg of $C_6H_5NO_2$.

Category Vitamin.

Storage Preserve in tightly closed containers.

Preparation (1) Nicotinic Acid Injection
(2) Nicotinic Acid Tablets

Nicotinic Acid Injection

Nicotinic Acid Injection contains not less than 95.0% and not more than 105.0% of the labelled amount of nicotinic acid ($C_6H_5NO_2$).

Description A clear, colourless liquid.

Identification (1) To a quantity, equivalent to 4 mg of nicotinic acid, add 8 mg of 2,4-dinitrochlorobenzene, heat gently for a few minutes, cool and add ethanolic potassium hydroxide TS, a violet-red colour is produced.

(2) The light absorption (Appendix IV A) of the solution obtained in Assay exhibits a maximum at 263 nm.

pH value 4.0-6.0 (Appendix VI H).

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml of the injection to a 100 ml volumetric flask, dilute with potassium hydroxide solution (0.1 mol/L) to volume, mix well. Measure accurately 5 ml of the solution to a 100 ml volumetric flask, dilute with potassium hydroxide solution (0.1 mol/L) to volume, mix well. Measure the absorbance of the resulting solution at 263 nm (Appendix IV A). Calculate the content of $C_6H_5NO_2$, taking 263 as the value of A (1%, 1 cm).

Category As described under Nicotinic Acid.

Strength (1) 2 ml:20 mg (2) 2 ml:100 mg
(3) 5 ml:50 mg

Storage Preserve in well closed containers, protected from light.

Nicotinic Acid Tablets

Nicotinic Acid Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of nicotinic acid ($C_6H_5NO_2$).

Description White tablets.

Identification (1) Dissolve a quantity of powdered tablets equivalent to 0.25 g of nicotinic acid in 100 ml of water and filter; the filtrate complies with test (2) for Identification described under Nicotinic Acid.

(2) Dilute the filtrate obtained in the above test with water to produce a solution of 20 µg per ml. The light absorption of the solution exhibits a maximum at 262 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 20 minutes and filter. Measure accurately 5 ml (for strength 100 mg) or 10 ml (for strength 50 mg) of the successive filtrate into a 25 ml volumetric flask and dilute with water to volume, mix well as the test solution. Measure the absorbance of the test solution at 262 nm (Appendix IV A). Dissolve a quantity of nicotinic acid CRS, weighed accurately, with water to produce a solution of about 20 µg per ml as the reference solution, repeat the operation instead of the test solution. Calculate the dissolution of $C_6H_5NO_2$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powdered tablets equivalent to 0.2 g of nicotinic acid, accurately weighed, add 50 ml of freshly boiled and cooled water, heat on a water bath and shake constantly. Cool to room temperature, add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 12.31 mg of $C_6H_5NO_2$.

Category As described under Nicotinic Acid.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers.

Nifedipine

$C_{17}H_{18}N_2O_6$ 346.34

[21829-25-4]

Nifedipine is 2,6-dimethyl-4-(2-nitrophenyl)-1,4-dihydro-3,5-pyridinedicarboxylic acid dimethyl ester. It contains not less than 98.0% and not more than 102.0% of $C_{17}H_{18}N_2O_6$, calculated on the dried basis.

Description A yellow, crystalline powder; odourless; tasteless; unstable on exposure to light. Freely soluble in acetone or chloroform; sparingly soluble in ethanol; practically insoluble in water.

Melting range 171-175°C (Appendix VI C).

Identification (1) Dissolve about 25 mg in 1 ml of acetone, add 3-5 drops of 20% sodium hydroxide solution and shake, an orange-red colour is produced.

(2) Dissolve a quantity with 2 ml of chloroform, add dehydrated ethanol to make a solution of 15 µg per ml. The

light absorption of the resulting solution exhibits maxima at 237 nm and wide absorption from 320-355 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nifedipine (Appendix XVI).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (3 : 2) as the mobile phase. Detection wavelength is 235 nm. Dissolve a quantity, accurately weighed, with methanol to produce solutions of the substance being examined containing (1) 1 mg per ml, (2) 0.2 mg per ml. Dissolve 10 mg each of nifedipine related substance A CRS and B CRS, accurately weighed, with methanol in a 50 ml volumetric flask and dilute to the volume as solution (3). Transfer 1 ml each of solution (2) and (3), accurately measured, to a 100 ml volumetric flask and dilute with the mobile phase to the volume as solution (4). Inject 20 μ l of solution (4) into the column. Adjust the attenuation so that the peak heights of substance A and B in the chromatogram are 20% of full scale of the chart. The resolution factors among peaks of substance A, B and nifedipine comply with related requirements. And then, inject 20 μ l each of solution (1) and (4) into the column, and record the chromatogram for twice the retention time of the principal peak. Each peak area of substance A and B in the chromatogram obtained with solution (1) is not greater than that of substance A and B obtained with solution (4) respectively; each peak area of the peak other than the substance A or B is not greater than the peak area of nifedipine obtained with solution (4); and the sum of them are not greater than 0.5% of the peak area of nifedipine. Any peak area obtained with solution (1) less than 10% of the peak area of nifedipine obtained with solution (4) can be omitted.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.001%.

Assay Dissolve 0.4 g, accurately weighed, in 50 ml of dehydrated ethanol by gently heating, add 50 ml of perchloric acid solution (dilute 8.5 ml of 70% perchloric acid with water to 100 ml), 3 drops of o-phenanthroline IS, titrate with cerium sulfate (0.1 mol/L) VS immediately until the reddish orange colour disappeared, heating on water bath to about 50°C when near to the end point. Perform a blank determination and make any necessary correction. Each ml of cerium sulfate (0.1 mol/L) VS is equivalent to 17.32 mg of $C_{17}H_{18}N_2O_6$.

Category Calcium channel blocker.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Nifedipine Capsules
(2) Nifedipine Soft Capsules
(3) Nifedipine Tablets

Nifedipine Capsules

Nifedipine Capsules contain not less than 90.0%

and not more than 110.0% of the labelled amount of nifedipine ($C_{17}H_{18}N_2O_6$).

Identification (1) Extract a quantity of the contents, equivalent to about 50 mg of nifedipine, with 3 ml of acetone, allow to stand, to 1 ml of the supernatant liquid add 3-5 drops of 20% sodium hydroxide solution, an orange red colour is produced with shaking.

(2) Dilute the solution obtained in Assay with the equal volume of dehydrated ethanol, the solution complies with the test (2) for Identification described under Nifedipine.

Related substances Protect from light throughout the procedure. Shake a quantity of the mixed contents obtained in the test for weight variation of content with acetone to dissolve nifedipine and produce a suspension containing 10 mg of nifedipine per ml, allow to stand, use the supernatant liquid as test solution. Measure accurately a quantity of the test solution, dilute with acetone to produce a solution of 0.2 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of benzene-chloroform-dehydrated ethanol (3 : 1 : 0.2) as the mobile phase. Apply separately to the plate 10 μ l each of the above two solutions. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution.

Content uniformity Protect from light in the procedure. Comply with the requirements (Appendix X E). Place the content of one capsule in a mortar, wash the shell with 2 ml of chloroform in portions, triturate and transfer to a 50 ml volumetric flask with dehydrated ethanol in portions, dilute with dehydrated ethanol to volume and mix well. Filter with a dry filter paper, measure accurately 5 ml (10 mg) or 10 ml (5 mg) of the successive filtrate into a 25 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 333 nm (Appendix IV A), calculate the content of $C_{17}H_{18}N_2O_6$, taking 140 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of content equivalent to about 30 mg of nifedipine, triturate with 2 ml of chloroform, transfer to a 100 ml volumetric flask with dehydrated ethanol in portions, dilute with dehydrated ethanol to volume and mix well. Measure accurately 5 ml of the successive filtrate into a 50 ml volumetric flask. Dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 333 nm (Appendix IV A) and calculate the content of $C_{17}H_{18}N_2O_6$, taking 140 as the value of A (1%, 1 cm).

Category As described under Nifedipine.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Nifedipine Soft Capsules

Nifedipine Soft Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of nifedipine ($C_{17}H_{18}N_2O_6$).

Description Capsules containing yellow viscous liquid.

Identification (1) Extract a quantity of the contents equivalent to about 50 mg of nifedipine with 3 ml of acetone, allow to stand, the supernatant liquid complies with test (1) for Identification described under Nifedipine.

(2) Comply with test (2) for Identification described under Nifedipine, using the solution obtained in the Assay diluted with an equal volume of dehydrated ethanol.

Related substances Protect from light in the procedure. Shake a quantity of the contents with acetone to dissolve nifedipine and produce a suspension containing 10 mg of nifedipine per ml, allow to stand, use the supernatant liquid as test solution. Measure accurately a quantity of the test solution, dilute with acetone to produce a solution of 0.20 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of benzene-chloroform-dehydrated ethanol (3 : 1 : 0.2) as the mobile phase. Apply separately to the plate 10 µl each of the above two solutions. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution.

Content uniformity Protect from light throughout the procedure. Comply with the requirements (Appendix X E). Transfer the content of one capsule to a 50 ml volumetric flask, wash the shell with 35 ml of dehydrated ethanol in portions, shake thoroughly, dilute with dehydrated ethanol to volume and mix well. Filter with a dry filter paper. Measure accurately 10 ml of the successive filtrate into a 25 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 333 nm (Appendix IV A), calculate the content of C₁₇H₁₈N₂O₆, taking 140 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Transfer an accurately weighed quantity of the mixed contents obtained in the test for weight variation of content equivalent to about 30 mg of nifedipine to a 100 ml volumetric flask, add dehydrated ethanol to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 333 nm (Appendix IV A) and calculate the content of C₁₇H₁₈N₂O₆, taking 140 as the value of A (1%, 1 cm).

Category, Storage As described under Nifedipine.

Strength 5 mg

Nifedipine Tablets

Nifedipine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nifedipine (C₁₇H₁₈N₂O₆).

Description Sugar-coated or film coated tablets with yellow core.

Identification (1) Shake a quantity of powdered tablets equivalent to about 50 mg of nifedipine with 3 ml of acetone and allow to stand, the clear supernatant liquid complies with test (1) for Identification described under Nifedipine.
(2) Comply with test (2) for Identification described under Nifedipine, using the solution obtained in the Assay, diluted with an equal volume of dehydrated ethanol.

Related substances Protect from light throughout the procedure. Comply with the test for Related substances described under Nifedipine. Shake a quantity of powdered tablets with acetone to dissolve nifedipine and produce a suspension containing 10 mg of nifedipine per ml allow to stand and use the supernatant liquid as solution (1). Dilute a quantity of solution (1) to produce a solution containing 0.2 mg of nifedipine per ml and use it as solution (2). Complete the test for Related Substances described under Nifedipine, beginning at the words "Dissolve 10 mg each of nifedipine related substance A CRS and B CRS,". Each peak area is not greater than 2.0%, and the sum of them is not greater than 3.0%, calculated on external standard method [the peaks other than the substance A or B are calculated on the peak area of nifedipine obtained with solution (4)]. Any peak area obtained with solution (1) which is less than 10% of the peak area of nifedipine obtained with solution (4) can be omitted.

Dissolution Protect from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.25% sodium laurylsulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 120 rpm. Withdraw 10 ml of the solution after exactly 60 minutes and filter. Take the successive filtrate as the test solution. Dissolve about 10 mg of nifedipine CRS, accurately weighed, with ethanol and dilute to 100 ml. Transfer 2 ml, accurately measured, to a 20 ml volumetric flask, dilute to volume with the dissolution medium as the reference solution. Carry out the method described under Related substances, inject 10 µl of the above two solutions into the column, and record the chromatogram. Calculate the dissolution of C₁₇H₁₈N₂O₆ from each tablet. Not less than 65% of the labelled amount is dissolved.

Content uniformity Comply with the test for content uniformity (Appendix X E). Protect from light throughout the procedure. Triturate 1 tablet with the coating removed in a mortar with 2 ml of chloroform. Transfer with dehydrated ethanol in portions to a 50 ml volumetric flask, dilute to volume and mix well. Filter and transfer 5 ml (for strength 10 mg) or 10 ml (for strength 5 mg) of the successive filtrate, accurately measured, to a 25 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 333 nm (Appendix IV A) and calculate the content of C₁₇H₁₈N₂O₆, taking 140 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A), except that the tablets disintegrate within 30 minutes.

Assay Protect from light throughout the procedure. Weigh accurately and powder 20 tablets with the coating removed. Triturate an accurately weighed quantity of the powder equivalent to about 30 mg of nifedipine with 2 ml of chloroform. Transfer with dehydrated ethanol in portions to a 100 ml volumetric flask, shake to dissolve nifedipine, dilute to volume and mix well, filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 333 nm (Appendix IV A) and calculate the content of C₁₇H₁₈N₂O₆, taking 140 as the value of A (1%, 1 cm).

Category, Storage As described under Nifedipine.

Strength (1) 5 mg (2) 10 mg

Nikethamide

$C_{10}H_{14}N_2O$ 178.23

[59-26-7]

Nikethamide is *N,N*-diethylpyridine-3-carboxamide. It contains not less than 98.5% (g/g) of $C_{10}H_{14}N_2O$.

Description A clear, colourless or pale yellow oily liquid, crystallizes at lower temperature; odour, slight and characteristic; taste, bitter; hygroscopic. Miscible with water, ethanol, chloroform or ether.

Relative density 1.058-1.066, at 25°C (Appendix VI A).

Congeeing point 22-24°C (Appendix VI D).

Refractive index 1.522-1.524, at 25°C (Appendix VI F).

Identification (1) Heat 10 drops with 3 ml of sodium hydroxide TS; diethylamine vapour is produced which turns moistened red litmus paper to blue.

(2) Mix 1 drop with 50 ml of water. To 2 ml of this solution add 2 ml of cyanogen bromide TS and 3 ml of 2.5% aniline solution, mix well, a yellow colour is produced.

(3) Mix 2 drops with 1 ml of water, add 2 drops of cupric sulfate TS and 3 drops of ammonium thiocyanate TS, a greenish yellow precipitate is produced.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nikethamide (Appendix XVI).

Acidity or alkalinity Dissolve 5.0 g in water to produce 20 ml, pH 6.5-7.8 (Appendix VI H).

Clarity and colour of solution A solution of 2.5 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 5.0 g; any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.0014%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and chloroform-*n*-propanol (75:25) as the mobile phase. Apply separately to the plate 10 µl each of three solutions of the substance being examined in methanol containing (1) 40 mg per ml, (2) 0.4 mg per ml, (3) 0.04 mg per ml. After development and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Only one secondary spot in the chromatogram obtained with solution (1) may be more intense than the principal spot obtained with solution (3), and any spot is not more intense than the principal spot obtained with solution (2).

Oxidizable substances To 1.2 g add 5 ml of water and 0.05 ml of potassium permanganate (0.02 mol/L) VS; the pink colour persists for not less than two minutes.

Water To 0.5 g add 5 ml of carbon disulfide, mix well, the solution is clear.

Assay To about 0.15 g, accurately weighed, add 10 ml of

glacial acetic acid and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 17.82 mg of $C_{10}H_{14}N_2O$.

Category Central stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Nikethamide Injection

Nikethamide Injection

Nikethamide Injection is a sterile solution of Nikethamide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nikethamide ($C_{10}H_{14}N_2O$).

Description A clear, colourless liquid.

Identification Saturate 5 ml with sodium carbonate, the oil layer (distinction from Nicotinamide Injection) complies with the tests (1), (2) and (3) for Identification described under Nikethamide.

pH value 5.5-7.8 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 1 ml to a 100 ml volumetric flask with a "to contain" pipet. Wash the inner wall of pipet with several portions of 0.5% sulfuric acid solution and transfer the washings to the same flask, add 0.5% sulfuric acid solution to volume and mix well. Measure accurately a quantity of the solution and add 0.5% sulfuric acid solution to produce a solution of 20 µg per ml. Measure the absorbance at 263 nm (Appendix IV A). Calculate the content of $C_{10}H_{14}N_2O$, taking 292 as the value of *A* (1%, 1 cm).

Category As described under Nikethamide.

Strength (1) 1.5 ml:0.375 g (2) 2 ml:0.5 g

Storage Preserve in well closed containers, protected from light.

Nilestriol

$C_{25}H_{32}O_3$ 380.53

[39791-20-3]

Nilestriol is 17α-ethynylestra-1,3,5(10)-triene-3,16α,17β-triol-3-cyclopentyl ether. It contains not less than 97.0% and not more than 103.0% of $C_{25}H_{32}O_3$, calculated on the dried basis.

Description A white or almost white crystalline powder. Freely soluble in chloroform; soluble in acetone; sparingly soluble in ethanol; practically insoluble in water.

Melting range 160-165°C (Appendix VI C).

Specific optical rotation $+2^{\circ}$ to $+10^{\circ}$, in a solution of about 10 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) To a quantity add 2-3 drops of sulfuric acid, a rose-red colour is produced, then changes to bluish-violet on pouring into 5 ml of water.

(2) The light absorption of the solution obtained under Assay exhibits maxima at 280 nm and 288 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nilestriol (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel as the coating substance and a mixture of benzene-acetone (4:1) as the mobile phase. Apply separately to the plate 5 μ l each of the solution (1) containing 10 mg of the substance being examined per ml and the solution (2) containing 0.2 mg of nilestriol CRS per ml in a mixture of chloroform-methanol (9:1). After developing and removal of the plate, dry it in air, spray with a mixture of sulfuric acid-ethanol (4:1), heat at 105°C for 20 minutes, and examine under the ultraviolet light (365 nm). Any spot other than the principal spot in the chromatogram obtained with the solution (1) is not more intense than the principal spot in the chromatogram obtained with the solution (2).

Loss on drying When dried in vacuum at 80°C for 4 hours loses not more than 3.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (80:20) as the mobile phase. Detection wavelength is 221 nm and the number of theoretical plates of the column is not less than 2500, calculate with reference to the peak of nilestriol.

Procedure Dissolve a quantity accurately weighed, with the mobile phase to produce a solution of 0.1 mg per ml. Inject 20 μ l of the solution into the column and record the chromatogram. Repeat the operation, using nilestriol CRS instead of the substance being examined. Calculate the content of $\text{C}_{25}\text{H}_{32}\text{O}_3$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, Protected from light.

Preparation Nilestriol Tablets

Nilestriol Tablets

Nilestriol tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nilestriol ($\text{C}_{25}\text{H}_{32}\text{O}_3$).

Description White tablets.

Identification Weigh and powder a quantity of tablets, equivalent to about 20 mg of nilestriol, extract with 30 ml of chloroform, filter and evaporate to dryness. The residue complies with the tests (1) and (2) for Identification described under Nilestriol.

Content uniformity Complies with the requirement (Appendix X E). Triturate 1 tablet with dehydrated ethanol, ultrasonicate for 10 minutes to make nilestriol dissolved, add dehydrated ethanol to produce a solution containing nilestriol 0.1 mg per ml, mix well and filter. Proceed with the successive filtrate as described in the

Assay, beginning at the words "Measure the absorbance of the successive filtrate..."

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 150 ml of 0.5% lauryl sodium sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution at 45 minutes and filter. Measure a quantity of the successive filtrate and dilute with the dissolution medium to produce a solution of about 6.5 μg per ml as the test solution. Dissolve a quantity of nilestriol CRS, weighed accurately, with the dissolution medium to produce a solution of about 6.5 μg per ml as the reference solution. Carry out the method as described in Assay under Nilestriol. Inject separately 50 μ l of the test solution and the reference solution into the column and record the chromatogram. Calculate the dissolution of $\text{C}_{25}\text{H}_{32}\text{O}_3$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of powdered tablets, equivalent to 10 mg of nilestriol, accurately weighed, in a 100 ml volumetric flask add a quantity of dehydrated ethanol, heat for 30 minutes on a water bath, shake frequently, allow it to cool, dilute with dehydrated ethanol to volume, and mix well. Filter. Measure the absorbance of the successive filtrate at 280 nm (Appendix IV A). Repeat the operation, using nilestriol CRS instead of the substance being examined. Calculate the content of $\text{C}_{25}\text{H}_{32}\text{O}_3$.

Category As described under Nilestriol.

Strength (1) 1 mg (2) 2 mg (3) 5 mg

Storage Preserve in tightly closed containers and a dry place.

Nimodipine

$\text{C}_{21}\text{H}_{26}\text{N}_2\text{O}_7$ 418.45

Nimodipine is 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate 2-methoxyethyl 1-methylethyl. It contains not less than 98.5% and not more than 101.5% of $\text{C}_{21}\text{H}_{26}\text{N}_2\text{O}_7$, calculated on the dried basis.

Description A pale yellow crystalline powder or powder; odourless; tasteless; degraded on exposure to light. Freely soluble in acetone, chloroform, ethyl acetate; soluble in ethanol; slightly soluble in ether; practically insoluble in water.

Melting point $124-128^{\circ}\text{C}$ (Appendix VI C).

Identification (1) Dissolve about 20 mg in 2 ml of ethanol, add 2 ml of freshly prepared 5% ammonium ferrous sulfate hexahydrate solution, 1 drop of 1.5 mol/L sulfuric acid

solution and 1 ml 0.5 mol/L potassium hydroxide solution, shake strongly, a precipitate is produced which turns greyish-green to reddish-brown in 1 minute.

(2) The light absorption of a solution of 10 µg per ml in ethanol exhibits a maximum at 237 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nimodipine (Appendix XXIII).

Related substances Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (35 : 38 : 27) as the mobile phase. Detection wavelength is 235 nm and the number of theoretical plates of the column is about 8000, calculated with reference to the peak of nimodipine. The resolution factor between the peaks complies with related requirements. Dissolve a quantity, accurately weighted, in mobile phase to produce a solution of 0.2 mg per ml as the test solution. Dilute the test solution with the mobile phase to produce a solution of 2 µg per ml as reference solution. Inject 10 µl of the reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is half of the full scale of the recorder. Inject separately 10 µl each of the two solutions into the column, and record the chromatogram for 4.5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.18 g, accurately weighed, with gentle heating in 25 ml of dehydrate ethanol, add 25 ml of perchloric solution (Dilute 8.5 ml of 70% perchloric acid with water to 100 ml) and 4 drops of ferroin IS, titrate with cerium sulphate (0.1 mol/L) VS until the colour of solution turns orange to slightly yellowish-green. Perform a blank determination and make any necessary correction. Each ml of cerium sulphate (0.1 mol/L) VS is equivalent to 20.92 mg of $C_{21}H_{26}N_2O_7$.

Category Calcium-channel blockers.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Nimodipine Tablets
(2) Nimodipine Dispersible Tablets
(3) Nimodipine Capsules
(4) Nimodipine Injection

Nimodipine Capsules

Nimodipine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of nimodipine ($C_{21}H_{26}N_2O_7$).

Description Capsules containing slightly to pale yellow powder.

Identification (1) Weigh a quantity of mixed contents

equivalent to about 40 mg of nimodipine, add about 5 ml of ethanol, shake to dissolve nimodipine and filter. Measure 3 ml of the filtrate, add 2 ml of freshly prepared 5% w/v of ammonium ferrous sulfate hexahydrate solution, 1 drop of 1.5 mol/L sulfuric acid solution and 1 ml 0.5 mol/L potassium hydroxide solution, shake strongly, a precipitate is produced which turns greyish-green to reddish-brown in 1 minute.

(2) The retention time of principal peak of nimodipine in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of nimodipine CRS in the chromatogram of the reference solution.

Carry out the following procedures protected from light.

Related substances Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask, ultrasonicate for 15 minutes, cool to room temperature, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. The supernatant liquid is as the test solution. Dilute the test solution with the mobile phase to produce a solution of 2 µg per ml as reference solution. Carry out the chromatography conditions as described under Assay and detection wavelength is 235 nm. Inject 10 µl of the reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is half of the full scale of the recorder. Inject separately 10 µl each of the two solutions into the column, and record the chromatogram for three times the retention time of the principal peak. Each peak area other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than twice of the area of the principal peak in the chromatogram obtained with the reference solution. Disregard any peak with the retention time less than 0.35 times relative to the principal peak in the chromatogram obtained with test solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of acetate buffer pH 4.5 (Dissolve 0.299 g of sodium acetate in 50 ml of water, add 0.174 g glacial acetic acid and dilute to 100 ml with water.) containing 0.3% w/v of sodium dodecyl sulphate as the dissolution medium and adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Measure accurately 10 ml of the successive filtrate in a 20 ml (for strength 20 mg) or 25 ml (for strength 30 mg) volumetric flask, dilute with the dissolution medium to volume as the test solution. Transfer 10 mg of nimodipine CRS to a 100 ml volumetric flask, accurately weighted, dissolve in 10 ml ethanol and dilute with the dissolution medium to volume, mix well. Measure accurately 5 ml of the solution in a 50 ml volumetric flask, dilute with the dissolution medium to volume as the reference solution. Measure the absorbance of the resulting solutions at 238 nm (Appendix IV A). Calculate the dissolution of $C_{21}H_{26}N_2O_7$ from each capsules, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (35 : 38 : 27) as the mobile phase. Detection wavelength is 237 nm and the number of

theoretical plates of the column is about 8000, calculated with reference to the peak of nimodipine. The resolution factor between the peaks complies with related requirements.

Reference solution Dissolve a quantity of nimodipine CRS, accurately weighed, in mobile phase to produce a solution of 20 µg per ml.

Test solution Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask, ultrasonicate for 15 minutes, cool to room temperature, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. Transfer accurately 5 ml the supernatant liquid to a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject 10 µl of the reference solution and the test solution into the column respectively and record the peak areas corresponding obtained in the chromatogram. Calculate the content of $C_{21}H_{26}N_2O_7$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Nimodipine.

Strength (1) 20 mg (2) 30 mg

Storage Preserve in tightly closed containers, protected from light.

Nimodipine Dispersible Tablets

Nimodipine Dispersible Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nimodipine ($C_{21}H_{26}N_2O_7$).

Description Slightly to pale yellow tablets.

Identification (1) Weigh a quantity of powdered tablets equivalent to about 40 mg of nimodipine, add about 5 ml of ethanol, shake to dissolve nimodipine and filter. Measure 3 ml of the filtrate, add 2 ml of freshly prepared 5% of ammonium ferrous sulfate hexahydrate solution, 1 drop of 1.5 mol/L sulfuric acid solution and 1 ml of 0.5 mol/L potassium hydroxide solution, shake strongly, a precipitate is produced which turns grayish-green to reddish-brown in 1 minute.

(2) The retention time of principal peak of nimodipine in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of nimodipine CRS in the chromatogram of the reference solution.

Carry out the following procedures protected from light.

Related substances Dissolve an accurately weighted quantity of powdered tablets equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask by ultrasonication for 15 minutes, cool to room temperature, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. The supernatant liquid is as the test solution. Dilute the test solution with the mobile phase to produce a solution of 2 µg per ml as reference solution. Carry out the chromatography conditions as described under Assay and detection wavelength is 235 nm. Inject 10 µl of the reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is half of the full scale of the recorder. Inject separately 10 µl each of the two solutions into the column, and record the chromatogram for three times the retention time of the principal peak. Each peak area other than the principal peak in the chromatogram

obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than twice of the area of the principal peak in the chromatogram obtained with the reference solution. Disregard any peak with the retention time less than 0.35 times relative to the principal peak in the chromatogram obtained with test solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of acetate buffer pH 4.5 (Dissolve 0.299 g of sodium acetate in 50 ml of water, add 0.174 g glacial acetic acid and dilute to 100 ml with water.) containing 0.3% of sodium dodecyl sulphate as the dissolution medium and adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Measure accurately 10 ml of the successive filtrate in a 20 ml (for strength 20 mg) or 25 ml (for strength 30 mg) volumetric flask, dilute with the dissolution medium to volume as the test solution. Transfer 10 mg of nimodipine CRS to a 100 ml volumetric flask, accurately weighed, dissolve in 10 ml of ethanol and dilute with the dissolution medium to volume, mix well. Transfer accurately 5 ml of the solution in a 50 ml volumetric flask, dilute with the dissolution medium to volume as the reference solution. Measure the absorbance of the resulting solutions at 238 nm (Appendix IV A). Calculate the dissolution of $C_{21}H_{26}N_2O_7$ from each tablets, not less than 85% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (35 : 38 : 27) as the mobile phase. Detection wavelength is 237 nm and the number of theoretical plates of the column is about 8000, calculated with reference to the peak of nimodipine. The resolution factor between the peaks complies with related requirements.

Reference solution Dissolve a quantity of nimodipine CRS, accurately weighed, in mobile phase to produce a solution of 20 µg per ml.

Test solution Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask, ultrasonicate for 15 minutes, cool to room temperature, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. Transfer accurately 5 ml the supernatant liquid to a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject 10 µl of the reference solution and the test solution into the column respectively and record the peak areas corresponding obtained in the chromatogram. Calculate the content of $C_{21}H_{26}N_2O_7$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Nimodipine.

Strength 20 mg

Storage Preserve in tightly closed containers, protected from light.

Nimodipine Injection

Nimodipine Injection is a sterile solution of Nimodipine in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of nimodipine ($C_{21}H_{26}N_2O_7$).

Description A clear, almost colourless liquid.

Identification (1) Measure a quantity equivalent to about 20 mg of nimodipine to a separator. Extract with 30 ml of ether and allow it to stand. Evaporate the ether layer to dryness on a water bath, cool, dissolve the residue in 2 ml ethanol, stir to dissolve nimodipine and transfer to a tube, add 3 ml of 1% mercuric chloride, a precipitate is produced. (2) The retention time of principal peak of nimodipine in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of nimodipine CRS in the chromatogram of the reference solution.

pH value 5.5-7.5 (Appendix VI H).

Colour Not more intense than that of reference solution YG₂ (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. The injection being examined is as the test solution. Dilute the test solution with the mobile phase to produce a solution of 2 µg per ml as reference solution. Carry out the chromatography conditions as described under Assay and detection wavelength is 235 nm. Inject 10 µl of the reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is half of the full of the scale of the recorder. Inject separately 10 µl each of the two solutions into the column, and record the chromatogram for three times the retention time of the principal peak. Each peak area other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than twice of the area of the principal peak in the chromatogram obtained with the reference solution. Disregard any peak with the retention time less than 0.45 times relative to the principal peak in the chromatogram obtained with test solution.

Pyrogens Comply with the test for pyrogens (Appendix XI D), using 2.5 ml per kg of the rabbit's weight.

Sterility Comply with the test for sterility (Appendix XII H, membrane filtration method).

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (35 : 38 : 27) as the mobile phase. Detection wavelength is 237 nm and the number of theoretical plates of the column is about 8000, calculated with reference to the peak of nimodipine. The resolution factor between the peaks complies with related requirements.

Reference solution Dissolve a quantity of nimodipine CRS, accurately weighed, in mobile phase to produce a solution of 20 µg per ml.

Test solution Measure accurately 5 ml in a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject 10 µl of the reference solution and the test solution, accurately measured, into the column respectively and record the peak areas corresponding obtained in the chromatogram. Calculate the content of $C_{21}H_{26}N_2O_7$ with respect to the peak area obtained in the chromatogram by external standard method.

Category As described under Nimodipine.

Strength (1) 20 ml:4 mg (2) 40 ml:8 mg
(3) 50 ml:10 mg

Storage Preserve in well closed containers, protected from light.

Nimodipine Tablets

Nimodipine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nimodipine ($C_{21}H_{26}N_2O_7$).

Description Pale yellow tablets, film or sugar coated tablets with pale yellow core.

Identification (1) Weigh a quantity of powdered tablets equivalent to about 40 mg of nimodipine, add about 5 ml of ethanol, shake to dissolve nimodipine and filter. Measure 3 ml of the filtrate, add 2 ml of freshly prepared 5% w/v of ammonium ferrous sulfate hexahydrate solution, 1 drop of 1.5 mol/L sulfuric acid solution and 1 ml 0.5 mol/L potassium hydroxide solution, shake strongly, a precipitate is produced which turns greyish-green to reddish-brown in 1 minute.

(2) The retention time of principal peak of nimodipine in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of nimodipine CRS in the chromatogram of the reference solution.

Carry out the following procedures protected from light.

Related substances Dissolve an accurately weighted quantity of the powder equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask, ultrasonicate for 15 minutes, cool, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. The supernatant liquid is as the test solution. Dilute the test solution with the mobile phase to produce a solution of 2 µg per ml as reference solution. Carry out the chromatography conditions as described under Assay and detection wavelength is 235 nm. Inject 10 µl of the reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is half of the full scale of the recorder. Inject separately 10 µl each of the two solutions into the column, and record the chromatogram for three times the retention time of the principal peak. Each peak area other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than twice of the area of the principal peak in the chromatogram obtained with the reference solution. Disregard any peak with the retention time less than 0.35 times relative to the principal peak in the chromatogram obtained with test solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of acetate buffer pH 4.5 (Dissolve

0.299 g of sodium acetate in 50 ml of water, add 0.174 g glacial acetic acid and dilute to 100 ml with water.) containing 0.3% w/v of sodium dodecyl sulphate as the dissolution medium and adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Measure accurately 10 ml of the successive filtrate in a 20 ml (for strength 20 mg) or 25 ml (for strength 30 mg) volumetric flask, dilute with the dissolution medium to volume as the test solution. Transfer 10 mg of nimodipine CRS to a 100 ml volumetric flask, accurately weighed, dissolve in 10 ml ethanol and dilute with the dissolution medium to volume, mix well. Measure accurately 5 ml of the solution in a 50 ml volumetric flask, dilute with the dissolution medium to volume as the reference solution. Measure the absorbance of the resulting solutions at 238 nm (Appendix IV A). Calculate the dissolution of $C_{21}H_{26}N_2O_7$ from each tablets, not less than 85% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-water (35 : 38 : 27) as the mobile phase. Detection wavelength is 237 nm and the number of theoretical plates of the column is about 8000, calculated with reference to the peak of nimodipine. The resolution factor between the peaks complies with related requirements.

Reference solution Dissolve a quantity of nimodipine CRS, accurately weighed, in mobile phase to produce a solution of 20 µg per ml.

Test solution Weigh accurately and powder 20 tablets (sugar coated tablets remove coating). Dissolve an accurately weighed quantity of the powder equivalent to about 10 mg nimodipine in the mobile phase in a 50 ml volumetric flask, ultrasonicate for 15 minutes, cool to room temperature, dilute with the mobile phase to volume, mix well and centrifuge at 3000 rpm for 10 minutes. Transfer accurately 5 ml the supernatant liquid to a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well.

Procedure Inject 10 µl of the reference solution and the test solution into the column respectively and record the peak areas corresponding obtained in the chromatogram. Calculate the content of $C_{21}H_{26}N_2O_7$ with respect to the peak area obtained in the chromatogram by external standard method.

Category As described under Nimodipine.

Strength (1) 20 mg (2) 30 mg

Storage Preserve in tightly closed containers, protected from light.

Nitrazepam

$C_{15}H_{11}N_3O_3$ 281.27

[146-22-5]

Nitrazepam is 1,3-dihydro-7-nitro-5-phenyl-2H-

1,4-benzodiazepin-2-one. It contains not less than 99.0% of $C_{15}H_{11}N_3O_3$, calculated on the dried basis.

Description A light yellow crystalline powder; odourless; tasteless.

Sparingly soluble in chloroform; slightly soluble in ethanol or ether; practically insoluble in water.

Melting point 226-229°C, with decomposition (Appendix VI C).

Identification (1) To 10 mg add 1 ml of methanol, 2 drops of sodium hydroxide TS; a bright yellow colour is produced.

(2) The light absorption of a solution of 8 µg per ml in dehydrated ethanol exhibits three maxima at 220 nm, 260 nm and 310 nm; the ratio of the absorbance at 260 nm to that at 310 nm is 1.45-1.65 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nitrazepam (Appendix XVI).

(4) Heat about 10 mg with 15 ml of dilute hydrochloric acid on a water bath for 15 minutes, cool, and filter. The filtrate yields the reactions characteristic of primary aromatic amines (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-acetone (3:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions of the substance being examined in chloroform-methanol (1:1) containing (1) 25 mg per ml, (2) 0.25 mg per ml. After developing and removal of the plate, dry it in air and spray with potassium iodobismuthate TS. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 15 ml of glacial acetic acid and 5 ml of acetic anhydride, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.13 mg of $C_{15}H_{11}N_3O_3$.

Category Anxiolytic and anticonvulsant.

Storage Preserve in tightly closed containers.

Preparation Nitrazepam Tablets

Nitrazepam Tablets

Nitrazepam Tablets contain not less than 99.0% and not more than 110.0% of the labelled amount of nitrazepam ($C_{15}H_{11}N_3O_3$).

Description White to pale yellow tablets.

Identification (1) Shake a quantity of the powdered tablets equivalent to 25 mg nitrazepam in 10 ml of chloroform to dissolve nitrazepam and filter. Evaporate the filtrate on a water bath to dryness. The residue complies with tests (1) and (4) for Identification described under Nitrazepam.

(2) The light absorption of the solution obtained in the

Assay exhibits three maxima at 220 nm, 260 nm and 310 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with dehydrated ethanol and transfer to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume, shake thoroughly and filter. Transfer accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, proceed as described in Assay, beginning at the words "add dehydrated ethanol,..."

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powdered tablets equivalent to about 4 mg of nitrazepam, accurately weighed, in a 100 ml volumetric flask, add an amount of dehydrated ethanol, shake thoroughly, dilute with dehydrated ethanol to volume and mix well. Filter with a dry filter paper and discard the initial filtrate. Transfer accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 260 nm (Appendix IV A). Calculate the content of $C_{15}H_{11}N_3O_3$, taking 602 as the value of A (1%, 1 cm).

Category As described under Nitrazepam.

Strength 5 mg

Storage Preserve in tightly closed containers.

Nitrendipine

$C_{18}H_{20}N_2O_6$ 360.37 [39562-70-4]

Nitrendipine is 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydro-3,5-pyridinedicarboxylic acid ethyl methyl ester. It contains not less than 99.0% of $C_{18}H_{20}N_2O_6$, calculated on the dried basis.

Description Yellow crystals or a crystalline powder; odourless; tasteless; deteriorated on exposure to light. Freely soluble in acetone or chloroform; sparingly soluble in methanol or ethanol; practically insoluble in water.

Melting point 157-161°C (Appendix VI C).

Identification (1) To about 50 mg add 1 ml of acetone and 3-5 drops of 20% sodium hydroxide TS, an orange red colour is produced.

(2) Protect from light in the procedure. The light absorption of a solution of 20 µg per ml in dehydrated ethanol exhibits two maxima at 236 nm and 353 nm and a minimum at 303 nm. The ratio of the absorbance at 353 nm to that at 303 nm is 2.1-2.3.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nitrendipine (Appendix XVI).

Chlorides Shake well 1.0 g with 50 ml of water, boil for 2-3 minutes, allow to cool and filter, using 25 ml of the successive filtrate, carry out the limit test for chlorides (Appendix VII A). Any opalescence produced is not more

pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Related substances Protect from light throughout the procedure. Dissolve a quantity of the substance being examined in methanol to produce solutions of 1 mg per ml (solution 1) and 40 µg per ml (solution 2). Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70:30) as the mobile phase. Detection wavelength is 237 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of nitrendipine. Inject 10 µl of the solution 2 into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20%-30% of the full scale of the chart. Inject separately 10 µl of solution 1 and solution 2 into the column, and record the chromatogram for 2.5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in solution 1 is not greater than the area of the principal peak in the chromatogram obtained with solution 2.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Iron Incinerate 1.0 g at 500-600°C, allow to cool, dissolve in 4 ml of dilute hydrochloric acid on a water bath, any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%) (Appendix VIII G).

Assay Dissolve about 0.13 g, accurately weighed, in 20 ml of glacial acetic acid and 10 ml of dilute sulfuric acid on warming, allow to cool, add 2-3 drops of o-phenanthroline IS, titrate with ceric sulfate (0.1 mol/L) VS until the red colour disappears. Perform a blank determination and make any necessary correction. Each ml of ceric sulfate (0.1 mol/L) VS is equivalent to 18.02 mg of $C_{18}H_{20}N_2O_6$.

Category Calcium channel blocker.

Storage Preserve in tightly closed containers, protected from light.

Preparation Nitrendipine Tablets

Nitrendipine Tablets

Nitrendipine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of nitrendipine ($C_{18}H_{20}N_2O_6$).

Description Pale yellow tablets.

Identification (1) Shake a quantity of the powdered tablets equivalent to about 50 mg of nitrendipine with 2 ml of acetone, filter, add 2-3 drops of 20% sodium hydroxide solution to the filtrate and shake, an orange-yellow colour is produced.

(2) Protect from light in the procedure. Transfer a quantity of powdered tablets equivalent to about 10 mg of nitrendipine to a 100 ml volumetric flask, add a quantity of dehydrated ethanol, shake to dissolve nitrendipine, dilute with dehydrated ethanol to volume and filter, dilute the successive filtrate with dehydrated ethanol to produce a solution of 20

μg per ml. The resulting solution complies with test (2) for identification described under Nitrendipine.

Related substances Protect from light throughout the procedure. Dissolve a quantity of the powdered tablets, accurately weighed, in methanol to produce a solution containing 1 mg of nitrendipine per ml, filter, using the filtrate as solution 1; measure accurately 5 ml, dilute with mobile phase to 100 ml and mix well as solution 2. Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70:30) as the mobile phase. Detection wavelength is 237 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of nitrendipine. Inject 10 μl of the solution 2 into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20%-30% of the full scale of the chart. Inject separately 10 μl of solution 1 and solution 2 into the column, and record the chromatogram for 2.5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in solution 1 is not greater than the area of the principal peak in the chromatogram obtained with solution 2.

Content uniformity Protect from light in the procedure. Comply with the requirements (Appendix X E). Triturate 1 tablet and transfer to a 100 ml volumetric flask with dehydrated ethanol in divided portions, shake frequently to dissolve nitrendipine in a 50-60°C water bath and cool to room temperature. Dilute with dehydrated ethanol to volume, mix well and filter. Transfer 5 ml of the successive filtrate to another 100 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance at 236 nm (Appendix IV A). Calculate the content of $\text{C}_{18}\text{H}_{20}\text{N}_2\text{O}_6$.

Dissolution Protect from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution at 60 minutes and filter. Measure the absorbance of the successive filtrate at 237 nm (Appendix IV A). Dissolve 14 mg of Nitrendipine CRS, accurately weighed, in 25 ml of ethanol, mix well. Transfer accurately 2 ml, to a 100 ml volumetric flask, dilute to volume with the dissolution medium, repeat the operation. Calculate the dissolution of $\text{C}_{18}\text{H}_{20}\text{N}_2\text{O}_6$ from each tablet. Not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 30 tablets. Dissolve a quantity of the powdered tablets equivalent to about 0.13 g of nitrendipine, accurately weighed, in 20 ml of glacial acetic acid and 10 ml of dilute sulfuric acid on warming. Complete the Assay described under Nitrendipine, beginning at the words "allow to cool...".

Category As described under Nitrendipine.

Strength 10 mg

Storage Preserve in tightly closed containers, protected from light.

Nitrofurantoin

$\text{C}_8\text{H}_6\text{N}_4\text{O}_5$ 238.16

[67-20-9]

Nitrofurantoin is 1-[[5-nitro-2-furanyl]methylene]-2,4-imidazolidinedione. It contains not less than 98.0% and not more than 102.0% of $\text{C}_8\text{H}_6\text{N}_4\text{O}_5$, calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, bitter. Darkens gradually on exposure to light. Soluble in dimethylformamide; slightly soluble in acetone; very slightly soluble in ethanol; practically insoluble in water or chloroform.

Identification (1) Dissolve about 5 mg in a mixture of 5 ml of water and 5 ml of sodium hydroxide TS, a deep orange-red colour is produced.

(2) Dissolve about 5 mg in a mixture of 5 ml of water and 0.2 ml of ammonia TS, add 5 ml of silver nitrate TS, a yellow precipitate is produced (distinction from furacillin and furazolidone).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of nitrofurantoin (Appendix XVI).

Acidity Shake 0.50 g with 50 ml of water for 10 minutes, filter; pH of the filtrate is 5.5-7.0 (Appendix VI H).

Related substances Protect from light throughout the procedure. Dissolve 0.25 g in 5 ml of dimethyl-formamide in a 10 ml volumetric flask, add acetone to volume, as test solution; transfer accurately 1 ml of the above solution to a 100 ml volumetric flask, add acetone to volume, as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance, and a mixture of nitromethane-methanol (9:1) as the mobile phase. Apply to the plate separately 10 μl each of two solutions. After developing and removal of the plate, allow it to dry in air, dry at 105°C for 5 minutes, spray with phenylhydrazine hydrochloride solution (dissolve 0.75 g of phenylhydrazine hydrochloride in 50 ml of water, decolourise with charcoal, add 25 ml of hydrochloric acid and sufficient water to produce 200 ml), heat at 105°C for 10 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution.

Loss on drying When dried at 105°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Protect from light throughout the procedure. Weigh accurately about 40 mg and dissolve in 10 ml of dimethylformamide in a 600 ml beaker, add rapidly 400 ml of water, mix well (if a precipitate is produced, warm gently to dissolve it). Transfer it to a 500 ml amber coloured volumetric flask, add water to volume, mix well. Transfer accurately 10 ml to a 100 ml amber coloured volumetric flask, dilute with water to volume, mix well. Measure the absorbance of the solution at 367 nm (Appendix IV A) within one hour, calculate the content of $\text{C}_8\text{H}_6\text{N}_4\text{O}_5$, taking

766 as the value of A (1%, 1 cm).

Category Antimicrobial agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Nitrofurantoin Enteric-coated Tablets

Nitrofurantoin Enteric-coated Tablets

Nitrofurantoin Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of nitrofurantoin ($C_8H_6N_4O_5$).

Description Enteric sugar coated tablets, with yellow core.

Identification Dissolve a quantity of the powdered tablets (equivalent to 25 mg of nitrofurantoin) in a mixture of 25 ml of water and 1 ml of ammonia TS with shaking, filter. The filtrate has an orange-yellow colour and complies with the tests (1) and (2) for Identification described under Nitrofurantoin.

Drug Release Protect from light throughout the procedure. Carry out the method for dissolution test (Appendix X D and X C, method 2), using 1000 ml of 0.1 mol/L hydrochloric acid solution as the released medium, adjust the rotational speed of the paddle to 150 rpm. No tablet cracks or disintegrates at 2 hours. Then repeat the operations using 1000 ml of phosphate BS (pH 7.2) instead of the released medium. Withdraw a quantity of the solution at 2 hours and filter. Transfer accurately 3 ml of the successive filtrate into a 25 ml volumetric flask and dilute with phosphate BS (pH 7.2) to volume, mix well. Measure the absorbance of the solution at 375 nm (Appendix IV A), calculate the drug release of $C_8H_6N_4O_5$ from each tablet, taking 753 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is released.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh and powder finely 10 tablets with enteric sugar coating removed. Dissolve a quantity of the powdered tablets equivalent to about 40 mg of nitrofurantoin in 10 ml of dimethylformamide in a 600 ml beaker, add rapidly 400 ml of water, mix well. Transfer to a 500 ml amber coloured volumetric flask, add water to volume and mix well. Filter through dry filter paper, discard the initial filtrate (carry out the above test at a temperature higher than 15°C). Transfer accurately 10 ml of the successive filtrate, complete the Assay described under Nitrofurantoin, beginning at the words "to a 100 ml amber coloured volumetric flask...". Calculate the content of $C_8H_6N_4O_5$.

Category As described under Nitrofurantoin.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Nitroglycerin Aerosol

Nitroglycerin Aerosol is a solution of nitroglycerin in ethanol. It contains not less than 85.0% and not more than 115.0% of the labelled amount of nitroglycerin ($C_3H_5N_3O_9$).

Description A colourless to pale yellowish green, clear liquid in pressurized container; spray out as foggy particles on release of the delivery valve.

Identification (1) On the aluminum cover of the container punch a hole and insert an injection needle into the container (do not contact the surface of liquid). Allow the propellant to expel completely, remove the aluminum cover and transfer the residual content to an evaporating dish, add 1 ml of potassium hydroxide TS and mix, evaporate the ethanol on a water bath. Dissolve a quantity of the residue in 2 ml of water containing 1-3 drops of dilute sulfuric acid and add a few drops of diphenylamine TS, add cautiously 2 ml of sulfuric acid along the inner wall of the test tube, an intense blue colour is produced at the interface of the two layers. (2) The retention time of principal peak in the chromatogram of the test solution obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution.

Colour of solution Select 2 aerosol containers, on the aluminum cover of the container punch a hole and insert an injection needle into the container (do not contact the surface of liquid). Allow the propellant to expel completely, remove the aluminum cover. Dilute the residual content of each container with the same volume of ethanol, any colour produced is not more intense than that of the same volume of reference solution YG₈ (Appendix IX A, method 1). If one of the containers fails to comply with the requirements, repeat the test on 3 additional containers and all of them should comply with the requirements.

Total number of deliveries per container Select 4 aerosol containers, shake thoroughly, discharge separately into a container containing a quantity of absorbent solution, count the number of discharges until the container is empty. Total number of discharges per container is not less than 200.

Content of active ingredient in an actuation Select 1 aerosol container, shake thoroughly. Discharge 5 deliveries, wash the mouthpiece with the mobile phase and dry completely. Place the container inverted perpendicularly in the vessel containing 30 ml of the mobile phase and discharge 10 deliveries below the surface of the solvent (at the interval of 5 seconds and with occasional shaking). Transfer the absorbent solution to a 50 ml volumetric flask. Remove the container, wash the mouthpiece and the vessel with the mobile phase for several times, add the washings to the same volumetric flask, dilute with the mobile phase to volume, and mix well. Determine the amount of active ingredient separately in the 6th to 15th deliveries, 91st to 100th deliveries and 181st to 190th deliveries by the method described under the Assay, by dividing the result by 10. The content of active ingredient in an actuation is not less than 80% and not more than 120% of the labelled amount.

Other requirements Comply with the general requirements for aerosol (Appendix I L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (50:50) as the mobile phase. Detection wavelength is 215 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of nitroglycerin.

Procedure On the aluminum cover of the container punch a hole and insert an injection needle with a dry rubber tubing into the container (do not contact the surface of liquid). The other end of the rubber tubing is inserted into a 100 ml volumetric flask containing 50 ml of mobile phase, allow the propellant to expel completely, remove the aluminum cover. Transfer the residual content into the 100 ml volumetric

flask. Wash the aluminum cover and the container with mobile phase, add washings to the same volumetric flask, dilute with mobile phase to volume, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured to a 50 ml volumetric flask, dilute with mobile phase to volume and mix well. Inject 20 μ l of the resulting solution into the column. Dissolve an accurately weighed quantity of nitroglycerin CRS in mobile phase to produce a solution of 0.1 mg per ml, repeat the operation. Calculate the content of $C_3H_5N_3O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Nitroglycerin Solution.

Strength 0.1 g of nitroglycerin per container; 200 deliveries per container; 0.5 mg of nitroglycerin per delivery

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Nitroglycerin Injection

Nitroglycerin Injection is a sterile solution of nitroglycerin in dehydrated ethanol. It contains not less than 90.0% and not more than 110.0% (g/ml) of the labelled amount of nitroglycerin ($C_3H_5N_3O_9$).

Description A clear, colourless liquid.

Identification 10 ml of the injection complies with tests for Identification described under Nitroglycerin Solution.

pH value Mix 5 ml with 1 drop of saturated potassium chloride solution, pH 3.0-6.5 (Appendix VI H).

Related substances Carry out the test for Related substances described under Nitroglycerin Solution. Apply separately to the same silica gel G plate 100 μ l each of two solutions in dehydrated ethanol containing (1) 1.0 mg per ml and (2) 10 μ g per ml. The results comply with the requirements.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the assay described under Nitroglycerin Solution.

Category Vasodilating agent.

Strength (1) 1 ml:1 mg (2) 1 ml:2 mg
(3) 1 ml:5 mg (4) 1 ml:10 mg

Storage Preserved in well closed containers, stored in cool place and protected from light.

Nitroglycerin Solution

Nitroglycerin Solution is a solution of nitroglycerin in dehydrated ethanol. It contains not less than 9.0% and not more than 11.0% (g/ml) of nitroglycerin ($C_3H_5N_3O_9$).

Description A colourless, clear liquid; odour, ethanolic.

Relative density 0.835-0.850 (Appendix VI A).

Identification (1) Mix 1 ml with 0.5 ml of sodium hydroxide TS in an evaporating dish, evaporate ethanol to about 0.2 ml on a water bath, cool. Heat about 0.1 ml of the resulting solution with 20 mg of potassium bisulphate, an irritant odour of acrylic aldehyde is produced.

(2) To the above remaining solution add 1-2 drops of sulfuric acid, mix well, add 1 drop of diphenylamine TS, an intense blue colour is produced.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-ethyl acetate-glacial acetic acid (16:4:1) as the mobile phase. Apply separately to the plate 20 μ l each of two solutions of nitroglycerin in dehydrated ethanol containing (1) 10 mg per ml, (2) 50 μ g per ml. After developing and removal of the plate, dry it in air and spray with ethanolic solution contained of 1% diphenylamine, irradiate for 5 minutes with an ultraviolet light (365 nm) and examine immediately. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (50:50) as the mobile phase. Detection wavelength is 215 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of nitroglycerin. The resolution factor between nitroglycerin peak and adjacent peaks complies with related requirements.

Procedure Dilute a quantity of nitroglycerin CRS, accurately measured, with the mobile phase to produce a solution of 0.1 mg per ml. Inject 10 μ l of the solution into the column. Repeat the operation, using the substance being examined instead of nitroglycerin CRS, calculate the content of $C_3H_5N_3O_9$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Vasodilating agent.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation (1) Nitroglycerin Injection
(2) Nitroglycerin Tablets
(3) Nitroglycerin Aerosol

Nitroglycerin Tablets

Nitroglycerin Tablets contain not less than 90.0% and not more than 115.0% of the labelled amount of nitroglycerin ($C_3H_5N_3O_9$).

Description White tablets.

Identification To a quantity of powdered tablets, equivalent to about 10 mg of nitroglycerin, add 10 ml of dehydrated ethanol. Shake to dissolve and filter. The filtrate complies with the tests for identification described under nitroglycerin solution.

Content uniformity Carry out the method described under Assay of nitroglycerin solution. Transfer 1 tablet in a 5 ml volumetric flask, add a quantity of mobile phase by ultrasonating for 3 minutes, and then shake for 30 minutes to dissolve nitroglycerin. Dilute to volume with the mobile phase, mix well and filter. Use the successive filtrate as the test solution. Calculate the content of each tablet. The results comply with the requirements (Appendix X E) except the deviation limit is $\pm 20\%$.

Other requirements Comply with the general requirements for tablets (Appendix I A), except the disintegration is within 2 minutes.

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 2.5 mg of nitroglycerin in a 25 ml volumetric flask. add a quantity of the mobile phase by ultrasonating for 3 minutes. shake for 30 minutes to dissolve nitroglycerin, and dilute to volume with the mobile phase, mix well. Filter. Carry out the Assay described under Nitroglycerin Solution, using the successive filtrate. Calculate the content of $C_3H_5N_3O_9$.

Category As described under Nitroglycerin Solution.

Strength 0.5 mg

Storage Preserve in tightly closed containers, stored at cool place and protected from light.

Nitrous Oxide

N_2O 44.01

[10024-97-2]

Nitrous oxide contains not less than 95.0% (ml/ml) of N_2O .

Description A colourless gas; odour not distinct; taste, sweetish; heavier than air.

At 20°C and under a pressure of 101.3 kPa (760 mm Hg), freely soluble in water or ethanol; soluble in ether.

Identification (1) A glowing splinter of wood bursts into flame on contact with the gas.

(2) Mix with an equal volume of nitrogen monoxide [Add 15 ml of water to dissolve 5 g of sodium nitrite and 2.5 g of potassium iodide in a test tube, nitrogen monoxide is evolved on adding dropwise sulfuric acid solution (1→3)], no red fume is evolved (distinction from ox^{en}).

Acidity or alkalinity To 0.3 ml each of methyl red IS and bromothymol blue IS add 400 ml of water, boil for 5 minutes and allow to cool. Transfer three portions each of 100 ml to three Nessler cylinders (A, B and C). Add 0.2 ml of hydrochloric acid (0.01 mol/L) VS to cylinder B and 0.4 ml of hydrochloric acid (0.01 mol/L) VS to cylinder C. Pass 2000 ml of the gas being examined through cylinder B with a flow rate of 4000 ml per hour. Any colour produced in cylinder B is not more intense than the orange red colour in cylinder C or the yellowish-green colour in cylinder A.

Carbon monoxide Pass 5000-10000 ml through the following scrubbers in series; (1) Saturated chromium trioxide-sulfuric acid solution, (2) Soli^o po assium hy^oroxide, (3) phosphorous pentoxide and then pass through a tube containing iodine pentoxide previously dried at 200°C, and keep the temperature of the tube at 120°C. Introduce the iodine vapour liberated to a conical flask containing potassium iodide TS. After the passing of the gas being examined, flush the apparatus with 5000 ml of carbon monoxide-free air (pass air through cuprous chloride solution to eliminate carbon monoxide) to expel residual carbon monoxide. Titrate the liberated iodine with sodium thiosulfate (0.002 mol/L) VS. Perform a blank determination with 5000 ml of carbon monoxide-free air and make any necessary correction. Each ml of sodium thiosulfate (0.002 mol/L) VS is equivalent to 0.112 ml of CO at 20°C under a pressure of 101.3 kPa (760 mmHg). The content of carbon monoxide in nitrous oxide is not more than 0.005% (ml/ml).

Carbon dioxide Pass 1000 ml into a Nessler cylinder containing 50 ml of clear barium hydroxide TS. The turbidity developed is not more pronounced than that of the reference solution prepared by dissolving 0.10 g of sodium bicarbonate in 100 ml of freshly boiled and cooled water and diluting 1.0 ml of the solution to 50 ml with clear barium

hydroxide TS.

Halogens To each of two Nessler cylinders A and B add 1 ml of silver nitrate TS and 50 ml of water, mix well. Pass 2000 ml of the gas being examined into cylinder A. Any opalescence produced is not more pronounced than that produced in cylinder B.

Readily reducible substances To each of two Nessler cylinders A and B add 15 ml of freshly prepared potassium iodidestarch IS, acidify with 1 drop of glacial acetic acid. Pass 2000 ml of the gas being examined into cylinder A. Any colour produced is not more intense than that produced in cylinder B.

Readily oxidizable substances To each of two Nessler cylinders A and B add 50 ml of water and 0.20 ml of potassium permanganate (0.02 mol/L) VS. Pass 2000 ml of the gas being examined into cylinder A. The solution in cylinder B is not more intensely coloured than that in cylinder A.

Arsine and phosphine Remove conical flask A of the apparatus described under the Limit test for Arsenic (Appendix VIII J, method 1), place a disc of mercuric chloride TP between the contacting surfaces D and E. Slowly pass through the tube 2000 ml of the gas being examined. No stain is produced on the mercuric chloride TP.

Water Pass the gas being examined through an absorption tube containing phosphorous pentoxide to expel air. Weigh the tube. Pass through a quantity of the gas being examined, weigh again. Each 1000 ml of the gas contains not more than 2 mg of water.

Assay Apparatus As shown in the figure, A is a glass tube with a capacity of about 15 ml. It has a wide lower part and a long and slender upper part with graduation. The space between each graduation occupies 1% of the total volume of the tube. The volume at the connection of the tube and the two-way tap B is 100%, the first graduation is 99%, the lowest is 98% down to 90%. B and C are two-way taps; D and F are bended tubes; E and G are straight tubes.

Procedure Invert the dried apparatus upside down, open tap C and close tap B. Using a thin rubber tube, siphon water from a reservoir and then connect it to tube E. Raise the apparatus, so that tap B is higher than the liquid surface in the reservoir. Open tap B, descend the apparatus slowly until water just fills into tap B, close tap B immediately. Turn the inverted apparatus over so that tap B is at the tip of the apparatus, twist tap B to make a connection between tube D and glass tube A. Pass the gas through tube F or G into the glass tube for a few minutes. Close successively tap G and B and keep the position of the apparatus below the

liquid level in the reservoir. Open slightly tap B, allow a few drops of water flow into the burette, close tap B and shake again. Open tap C to drain most part of the water and then close it. Take care not drain the water completely so as to avoid the inlet of air. Open tap B again and allow a small quantity of water flow into the burette, shake and drain the water again. Repeat the procedure several times until all the gas is dissolved in water and the volume of gas in burette is not further reduced. Close both tap B and C, connect the rubber tube of the reservoir to tube F or G, expel the air from tap C with water. Raise the apparatus and open tap C when the surface of the liquid in the tube reaches the same level as that of the liquid in the reservoir and the pressure within the burette is in equilibrium with atmospheric pressure. Close tap C and take reading from the graduation. Calculate the volume of nitrous oxide from the volume of gas unabsorbed. Gas cylinder must be kept at 23-27°C for not less than 6 hours before determination.

Category General anaesthetics administered by inhalation.

Storage Preserve in a pressure-resistant metal cylinder, protected from light and stored in a cool and dark place.

Nonoxinol

Nonoxinol is a mixture of nonoxinol and cyclohexylamine, it contains not less than 90.0% and not more than 110.0% of $\text{C}_9\text{H}_{19}\text{C}_6\text{H}_4(\text{OCH}_2\text{CH}_2)_n$.

Description A colourless to almost pale yellow viscous liquid; odour. Freely congealing not more than 10°C. Very soluble in ethanol; Freely soluble in water.

Cloud Point Dissolve 1.0 g in 100 ml of water in a 250 ml beaker. Heat the beaker on a water bath stirring continuously with a thermometer until the solution become cloudy. Remove the beaker from the bath immediately and continue stirring. The cloud point is the temperature at which the solution becomes sufficiently clear that the entire thermometer bulb is seen plainly; it is between 52°C and 56°C.

Acid value not more than 0.2 (Appendix VII H).

Identification (1) The retention time of principal peaks of nonoxinol in substance being examined in the chromatogram obtained in Assay is identical with that of the principal peaks of nonoxinol CRS in the chromatogram of the reference solution. Nonoxinol in the chromatogram obtained under Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Nonoxinol (Appendix XVI).

Macrogol Dissolve 10 g in 100 ml of ethyl acetate in a 250 ml beaker, transfer to 500 ml separator, add 100 ml of 3% sodium chloride solution, shake well for 1 minute, insert separator on the 50°C water bath, transfer sodium chloride to other 500 L of separator and extract chloroform one times, filtrate drying filtrate on water bath, cool and add 250 ml of acetone dry at 60°C for 1 hour, cool, not more than 1.6% of macrogol.

Dioxane Measure accurately a quantity, add nonoxinol which stand at 160°C for 5 hours to produce 5 µg per g. Carry out the method for gas chromatography (Appendix V E), using a column packed with ethyl diethylphenyl,

maintain the column temperature at 160°C, chromatography temperature at 200°C. The content complies with the related requirements.

Free ethylene Oxide Measure accurately a quantity, add nonoxinol which stand at 150°C for 3 hours to produce 5 µg per g. Carry out the method for gas chromatography (Appendix V E), using a column packed with ethyl diethylphenyl, maintain the column temperature at 80°C, chromatography temperature at 160°C, Transfer accurately 5 µg to a small glass bottle, preserve in well closed containers, and stand to 100°C for 30-50 minutes. Inject 100 µl of the resulting solution into column, comply with the related requirements.

Water Not more than 0.5% (Appendix VII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (88 : 12) as the mobile phase. Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 1000.

Procedure Dissolve about 0.1 g, accurately weighed, in mobile phase in a 50 ml volumetric flask, and dilute to volume, mix well. Injection 10 µl of the resulting solution into the column. Repeat the operation, using the Nonoxinol CRS instead of the substance being examined, calculate the content of Nonoxinol with respect to the peak area obtained in the chromatogram by the external standard method.

Category Surfactant, spermicide.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Nonoxinol Pellicles
(2) Nonoxinol Suppositories
(3) Nonoxinol Vaginal Tablets

Ethylene oxide solution *Preparation* Dissolve 25 ml ethylene oxide CRS in isopropanol in 500 ml volumetric flask. Shake well and preserve in ice containers.

Standardization Transfer accurately 25 ml of ethanol hydrochloride in a conical flask with 40 mg of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$, 10 ml of ethylene oxide solution accurately and 1 ml of 0.05% bromocresol green IS, a yellow colour is produced. Titrate with 10 ml of ethanol hydrochloride (0.5 mol/L) VS, stand on ice bath for 30 minutes, titrate with ethanolic potassium hydroxide (0.5 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ethanol hydrochloride (0.5 mol/L) VS is equivalent to 22.02 mg of ethylene oxide.

Nonoxinol Pellicles

Nonoxinol pellicles contains not less than 90.0% and not more than 115.0% of the labelled amount of nonoxinol.

Description clear, white to pale yellow translucent pellicles.
Freely soluble in water.

Identification (1) Dissolve 1 piece of pellicle in 5 ml of water, 5 drops of hydrochloric acid and 0.1 g of sodium chloride, shake well, add potassium ferrocyanide TS, a white precipitate is produced.
(2) The retention time of principal peaks of nonoxinol in substance being examined in the chromatogram obtained in

Assay is identical with that of the principal peaks of nonoxinol CRS in the chromatogram of reference solution.

Acidity Dissolve 1 piece of pellicle in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Weight variation Complies with the weight variation described under pellicles (Appendix I M).

Disintegration Hold separately between two sieve with pore 3.5 cm in diameter, to 20 pieces of pellicles on a 37°C water bath, not more than 3 minutes.

Assay Weigh and cut 20 pieces of pellicle. To a quantity of the cut pellicles equivalent to about 100 mg of nonoxinol in a 100 ml volumetric flask, Dilute with water to volume, mix well and filter, take the successive filtrate as the test solution. Dissolve a quantity of nonoxinol CRS, weighed accurately, with mobile phase to produce a solution of about 1 mg per ml as the reference solution. Carry out the Assay under Nonoxinol. Calculate the content of $C_{33}H_{60}O_{10}$.

Category As described under Nonoxinol.

Strength 50 mg (10 cm×5 cm, 7 cm×5 cm, 5 cm×5 cm)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Nonoxinol Suppositories

Nonoxinol Suppositories contain not less than 90.0% and not more than 115.0% of the labelled amount of nonoxinol ($C_{33}H_{60}O_{10}$).

Description White or creamy white suppositories.

Identification (1) Dissolve 1 suppository with 10 ml of water and filter, transfer 2 ml of the filtrate, add 3 drops of hydrochloric acid and 0.1 g of Sodium chloride. Add 3 drops of potassium ferrocyanide TS, a white precipitate is produced.

(2) The retention time of principal peaks of nonoxinol in substance being examined in the chromatogram obtained in Assay is identical with that of the principal peaks of nonoxinol CRS in the chromatogram of reference solution.

(3) Dissolve an accurately weighed quantity in water to produce a solution of 0.2 mg per ml. The light absorption of the solution obtained in the Assay exhibits a maximum at 275 nm (Appendix IV A).

Acidity Dissolve 3 suppositories in 30 ml of water, pH 3.5-6.5 (water soluble base). Dissolve 3 suppositories, in 30 ml of water, on water bath of 40°C, pH 5.0-7.5 (fatty base) (Appendix VI H).

Disintegration not more than 25 minutes (Appendix X B).

Other requirements Comply with the general requirements for suppository (Appendix I D).

Assay Cut 10 suppositories, weighed accurately a quantity of the powder equivalent to about 50 mg of Nonoxinol to a small beaker, add 20 ml of methanol, dissolve nonoxinol on water bath at 40-50°C, transfer to 50 ml volumetric flask, cool to room temperature, dilute with methanol to volume, mix well allow to stand, take the supernatant liquid as the test solution. Dissolve a quantity of nonoxinol CRS, weighed accurately, in mobile phase to produce a solution of about 1 mg per ml as the reference solution. Carry out the method as described under Assay in Nonoxinol. Calculate the content of $C_{33}H_{60}O_{10}$.

Category As described under Nonoxinol.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Nonoxinol Vaginal Tablets

Nonoxinol Vaginal Tablets contains not less than 90.0% and not more than 110.0% of the labelled amount of Nonoxinol ($C_{33}H_{60}O_{10}$).

Description White tablets.

Identification (1) Dissolve 2 tablets in 10 ml of water, filter, dilute 2 ml of the filtrate, add 3 drops of hydrochloric acid, about 0.1 g of sodium chloride and 3 drops of potassium ferrocyanide TS, a white colour is produced.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in Assay is identical with that of principal peaks of nonoxinol CRS in the chromatogram of the reference solution.

(3) The light absorption of the solution of 0.2 mg per ml in water exhibits a maximum at 275 nm (Appendix IV A).

Acidity or Alkalinity Dissolve 3 tablets in 30 ml of water, filter, pH 6.0-8.0 (Appendix VI H).

Disintegration and effervescence Add 3 ml of water to each of six 25 ml cylinder separately, on a water bath at 37°C, add 1 tablet to each one, the maximum volume of effervescence is greater than 15 ml and disintegration time is not more than 5 minutes.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity equivalent to about 100 mg of nonoxinol in mobile phase in a 100 ml volumetric flask by shaking for 15 minutes, and dilute to volume, shake well, filter. Take the successive filtrate as the test solution. Dissolve a quantity of nonoxinol CRS, weighed accurately, in mobile phase to produce a solution of about 1 mg per ml as the reference solution. Carry out the method as described under Assay in Nonoxinol, calculate the content of $C_{33}H_{60}O_{10}$.

Category As described under Nonoxinol.

Strength 0.1 g

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Noradrenaline Bitartrate

$C_8H_{11}NO_3 \cdot C_4H_6O_6 \cdot H_2O$ 337.28 [69815-49-2]

Noradrenaline Bitartrate is (R)-4-(2-amino-1-hydroxyethyl)-1,2-benzenediol, [R-(R*, R*)]-2,3-dihydroxybutanedioate (1:1) (salt), monohydrate. It contains not less than 99.0% of $C_8H_{11}NO_3 \cdot C_4H_6O_6$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, bitter; deteriorated on exposure to light or air.

Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Melting range 100-106°C, with decomposition and becomes turbid (Appendix VI C).

Specific optical rotation -10.0° to -12.0° , in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 10 mg in 1 ml of water, add 1 drop of ferric chloride TS, shake, an emerald green colour is produced, which becomes blue and then red on addition of sodium bicarbonate TS slowly.

(2) Dissolve about 1 mg in 10 ml of a saturated solution of potassium hydrogen tartrate, add 1 ml of iodine TS. Allow to stand for 5 minutes, add 2 ml of sodium thiosulfate TS, the solution is colourless, or slightly red or pale purple in colour (distinction from adrenaline and isoprenaline).

(3) Dissolve about 50 mg in 1 ml of water, add 1 ml of a 10% solution of potassium chloride, a crystalline precipitate is produced within 10 minutes.

Clarity and colour of solution The solution obtained in Specific optical rotation is clear and colourless.

Ketone The absorbance of a solution of 2.0 mg per ml in water at 310 nm is not greater than 0.05 (Appendix IV A).

Water 5.0%-6.0% (Appendix VIII M, method 1A), using 50 mg.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g accurately weighed in 10 ml of 10% acetic acid, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.93 mg of $C_{20}H_{26}NO_2 \cdot C_4H_6O_6 \cdot H_2O$.

Category Adrenergic receptor stimulant.

Storage Preserve in hermetically sealed containers filled with inert gas, protected from light.

Preparation Noradrenaline Bitartrate Injection

Noradrenaline Bitartrate Injection

Noradrenaline Bitartrate Injection is a sterile, isotonic solution of Noradrenaline Bitartrate in Water for Injection, made isotonic by addition of sodium chloride. It contains not less than 90.0% and not more than 115.0% of the labelled amount of noradrenaline bitartrate ($C_8H_{11}NO_3 \cdot C_4H_6O_6 \cdot H_2O$). It may contain suitable stabilizers.

Description A clear, colourless or almost colourless liquid; deteriorated on exposure to light or air.

Identification (1) To 1 ml add 1 drop of ferric chloride TS, an emerald green colour is produced.

(2) Complies with test (2) for Identification described under Noradrenaline Bitartrate, using a quantity equivalent to about 1 mg of noradrenaline bitartrate.

pH value 2.5-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.14% sodium heptanesulfonate solution-methanol (65:35), adjusting to pH 3.0 ± 0.1 with phosphoric acid, as the mobile phase. The flow rate is 1 ml per minute. The detection wavelength is 280 nm. The number of theoretical plate is not less than 3000, calculated with reference to the peak of noradrenaline bitartrate.

Procedure Transfer accurately a quantity of the substance being examined, equivalent to about 4 mg of noradrenaline bitartrate, in a 25 ml volumetric flask, dilute to volume with acetic acid solution (1→25), mix well. Inject 20 μ l of the resulting solution into the column and record the chromatogram. Repeat the operation, using a solution of 0.16 mg per ml prepared with noradrenaline bitartrate CRS instead of substance being examined, calculate the content of $C_8H_{11}NO_3 \cdot C_4H_6O_6 \cdot H_2O$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Noradrenaline Bitartrate.

Strength (1) 1 ml : 2 mg (2) 1 ml : 5 mg
(3) 2 ml : 10 mg

Storage Preserve in well closed containers, protected from light and stored in a cool place.

Norethisterone

$C_{20}H_{26}O_2$ 298.43

[68-22-4]

Norethisterone is 17 β -hydroxy-19-nor-17 α -pregn-4-en-20-yn-3-one. It contains not less than 97.0% and not more than 102.0% of $C_{20}H_{26}O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless, taste slightly bitter.

Soluble in chloroform; slightly soluble in ethanol; sparingly soluble in acetone; insoluble in water.

Melting range 202-208°C (Appendix VI C).

Specific optical rotation -22° to -28° , in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve about 10 mg in 1 ml of ethanol, add 5-6 drops of silver nitrate TS, a white precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV A) is concordant with the reference spectrum of norethisterone (Appendix XVI).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, with methanol to produce a solution of about 2 mg per ml as the test solution (1). Transfer accurately 3 ml of solution (1) into a 100 ml volumetric flask and dilute with methanol to volume, mix well as the reference solution (2). Inject 10 μ l of solution (2) into the column, adjust the attenuation so that the peak height of principal peak in the chromatogram is about 10% of full scale of the chart. Inject separately 10 μ l

each of the solution (1) and (2) into the column and record the chromatogram for twice of the retention time of the principal peak. The sum of the areas of all secondary peak is not greater than the area of the principal peak of solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D) using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (65:35) as the mobile phase. The detection wavelength is 244 nm. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of norethisterone. The resolution factors between the peaks of norethisterone and the internal standard, norethisterone and the impurity next to the principal peak comply with the related requirements.

Internal standard solution Dissolve 25 mg of progesterone, accurately weighed, with methanol in a 25 ml volumetric flask, and dilute to volume.

Procedure Dissolve 25 mg of norethisterone CRS, accurately weighed, in a 25 ml volumetric flask, with methanol and dilute to volume, mix well. Accurately transfer 2 ml of the above solution and 3 ml of the internal standard solution to a 10 ml volumetric flask, dilute to volume with methanol, and mix well. Inject 20 µl of the resulting solution into the column. Repeat the operation, using the substance being examined instead of norethisterone CRS. Calculate the content of $C_{20}H_{26}O_2$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Progesteroide.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Norethisterone Pills
(2) Norethisterone Tablets
(3) Compound Norethisterone Pellicles
(4) Compound Norethisterone Tablets

Norethisterone Pills

Norethisterone Pills contain not less than 90.0% and not more than 110.0% of the labelled amount of Norethisterone ($C_{20}H_{26}O_2$).

Description Creamy white to pale yellow dripping pills.

Identification The retention time of the principal peak of norethisterone in the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of norethisterone CRS in the chromatogram of the reference solution.

Other requirements Comply with the general requirements for dripping pills (Appendix I H).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (60:40) as the mobile phase. The detection wavelength is 240 nm. The number of the column is not less than 2500, calculated with reference to the peak of norethisterone. The resolution factor between the peaks of norethisterone and the internal standard complies with the related requirements.

Internal standard solution Dissolve 25 mg of hydrocortisone

acetate in 5 ml of methanol by heating in a hot water bath, cool to room temperature, and dilute to 100 ml with the mobile phase.

Procedure Transfer 10 mg of norethisterone CRS, accurately weighed, to a 50 ml volumetric flask, and a quantity of the mobile phase, dissolve by ultrasonating for several minutes. Dilute to volume with the mobile phase, and mix well. Accurately transfer 5 ml each of the above solution and the internal standard solution in a 25 ml volumetric flask and dilute to volume with the mobile phase, mix well. Inject 20 µl of the resulting solution into the column. Weigh accurately and powder 20 pills. Grind a quantity equivalent to about 10 mg of norethisterone. Transfer it to a 50 ml volumetric flask, add a quantity of the mobile phase, shake to dissolve in a hot water bath, cool to room temperature, dilute to volume with the mobile phase, mix well, and filter. Accurately transfer 5 ml each of the successive filtrate and the internal standard solution in a 25 ml volumetric flask. Dilute to volume with the mobile phase, and mix well. Inject 20 µl of the resulting solution into the column. Calculate the content of $C_{20}H_{26}O_2$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Norethisterone.

Strength 3 mg

Storage Preserve in tightly closed containers, protected from light.

Norethisterone Tablets

Norethisterone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Norethisterone ($C_{20}H_{26}O_2$).

Description Sugar coating or film-coated tablets with white or almost white core.

Identification (1) Dissolve a quantity of fine powder equivalent to about 10 mg of norethisterone in 1 ml of ethanol, centrifuge, the supernatant liquid complies with the test (1) for Identification described under norethisterone.

(2) Dissolve a quantity of fine powder in dehydrate ethanol to produce a solution of about 10 µg per ml and filter. The light absorption of the successive filtrate exhibits a maximum at 240 nm (Appendix IV A).

(3) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Content uniformity Comply with the requirements (Appendix X E). Take 1 tablet into a 25 ml (for strength 0.625 mg) or 100 ml (for strength 2.5 mg) volumetric flask, add a quantity of mobile phase and ultrasonicate to make norethisterone dissolved, dilute with mobile phase to volume, mix well and centrifugate, take the supernate as the test solution Carry out the method as described under Assay, calculate the content of $C_{20}H_{26}O_2$ from each tablet. The limit of content uniformity is $\pm 20\%$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (65:35) as the mobile phase. Detection Wavelength is 244 nm, and the number of theoretical plates of the column is not less than 1500, calculated with reference

to the peak of norethisterone. The resolution factor between the peaks of norethisterone and adjacent impurities complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets removed the coat. To a quantity, weighed accurately, equivalent to about 1.25 mg of norethisterone, to a 50 ml volumetric flask, add a quantity of mobile phase and ultrasonicate to make norethisterone dissolved, cool to room temperature and dilute with mobile phase to volume, mix well and centrifugate, take the supernate as the test solution. Inject 20 μ l into the volume, record the chromatogram. Dissolve a quantity of norethisterone CRS, accurately weighed, in mobile phase to produce a solution of about 25 μ g per ml, repeat the operations instead of the test solution, calculate the content of $C_{20}H_{26}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Norethisterone.

Strength (1) 0.625 mg (2) 2.5 mg

Storage Preserve in tightly closed containers, protected from light.

Compound Norethisterone Pellicles

Compound Norethisterone Pellicles contain 0.54-0.66 mg of norethisterone ($C_{20}H_{26}O_2$) and 31.5-38.5 μ g of ethinylestradiol ($C_{20}H_{24}O_2$) in each square.

Formula	Norethisterone	600 mg
	Ethinylestradiol	35 mg
	To make	1000 squares

Processing Disperse the active ingredients in a suitable solvent, apply evenly onto a piece of swellable paper and allow to dry.

Description Pellicles, swellable in water.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 square to a 50 ml volumetric flask, add a quantity of dehydrated ethanol, break the pellicle with a glass rod. Heat in a hot water bath for 30 minutes with constant shaking to dissolve norethisterone, cool to room temperature, dilute to volume with dehydrated ethanol and mix well. Filter, and take the successive filtrate as the test solution. Carry out the method as described under Assay. Calculate the content of norethisterone ($C_{20}H_{26}O_2$).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (45:55) as the mobile phase. Detection Wavelength is 200 nm, and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of norethisterone. The resolution factor between the peaks of norethisterone and ethinylestradiol complies with the related requirements.

Procedure Cut 8 squares into small pieces and transfer to a 100 ml volumetric flask. Add a quantity of dehydrated ethanol, in a hot water bath for 30 minutes with constant shaking to dissolve norethisterone and ethinylestradiol, cool

to room temperature, dilute to volume with dehydrated ethanol, mix well and filter, take the successive filtrate as the test solution. Inject 50 μ l into the column and record the chromatogram. Dissolve a quantity of norethisterone and ethinylestradiol CRS, accurately weighed, in 5 ml of acetonitrile to a 10 ml volumetric flask to produce a solution of about 60 μ g of norethisterone and 3.5 μ g of ethinylestradiol per ml, repeat the operations instead of the test solution, calculate the content of $C_{20}H_{26}O_2$ and $C_{20}H_{24}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Compound Norethisterone Tablets

Compound Norethisterone Tablets contain 0.54-0.66 mg of norethisterone ($C_{20}H_{26}O_2$) and 31.5-38.5 μ g of ethinylestradiol ($C_{20}H_{24}O_2$) in each tablet.

Formula	Norethisterone	600 mg
	Ethinylestradiol	35 mg
	To make	1000 tablets

Description Sugar coated tablets with white or almost white core.

Identification (1) Pulverize finely 2 tablets, add 5 ml of chloroform-methanol (9:1) and stir thoroughly, filter, evaporate the filtrate on a water bath to about 0.5 ml. Dissolve norethisterone CRS in chloroform-methanol (9:1) to produce a solution of 2.4 mg per ml. Dissolve ethinylestradiol CRS in chloroform-methanol (9:1) to produce a solution of 0.14 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate (4:1) as the mobile phase. Apply separately to the plate 10 μ l each of the three solutions mentioned above. After developing and removal of the plate, dry it in air and spray with sulfuric acid-dehydrated ethanol (7:3), heat at 100°C for 5 minutes. The colour and position of the principal spots in the chromatogram obtained with the solution of substance being examined are identical with those in the chromatogram obtained with the other two solutions, respectively.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay. Test (1) and (2) may be used alternatively.

Content uniformity Comply with the requirements (Appendix X E). Take 1 tablet into a 10 ml volumetric flask, add 0.5 ml of water to make the tablet disintegrated, then add 5 ml of acetonitrile and ultrasonicate for 15 minutes to dissolve norethisterone and ethinylestradiol, dilute to volume with water, shake well and centrifugate, take the supernate as the test solution. Carry out the method as described under Assay, calculate the content of $C_{20}H_{26}O_2$. The limit of the content variation is $\pm 20\%$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 200 ml of 0.5% lauryl sodium sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution at 60 minutes and filter. Take the successive filtrate as the test solution. Dissolve about 12 mg of norethisterone

CRS, weighed accurately, with 10 ml of ethanol in a 200 ml volumetric flask and dilute to volume with the dissolution medium, mix well. Transfer accurately 5 ml of the solution into a 100 ml volumetric flask and dilute with the dissolution medium to volume, mix well as the reference solution. Carry out the method as described under Assay. Inject separately 20 μ l of the test solution and the reference solution into the column and record the chromatogram. Calculate the dissolution of $C_{20}H_{25}O_2$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (45:55) as the mobile phase. Detection wavelength is 200 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of norethisterone. The resolution factor between the peaks of norethisterone and ethinylestradiol complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 3 mg of norethisterone, to a 50 ml volumetric flask, add 25 ml of acetonitrile and ultrasonicate to make norethisterone and ethinylestradiol dissolved, then dilute with water to volume, mix well and centrifugate, take the supernate as the test solution. Inject 50 μ l of the test solution into the column and record the chromatogram. Dissolve a quantity of norethisterone and ethinylestradiol CRS, accurately weighed, with 5 ml of acetonitrile in a 10 ml volumetric flask and dilute to produce a solution of about 60 μ g of norethisterone and 3.5 μ g of ethinylestradiol per ml as the reference solution. Repeat the operations using the reference solution instead of the test solution, calculate the content of $C_{20}H_{25}O_2$ and $C_{20}H_{24}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Norfloxacin

$C_{16}H_{18}FN_3O_3$ 319.34

[70458-96-7]

Norfloxacin is 1-ethyl-6-fluoro-1, 4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid. It contains not less than 98.5% and not more than 102.0% of $C_{16}H_{18}FN_3O_3$, calculated on the dried basis.

Description An almost white to yellowish crystalline powder; odourless; taste, slightly bitter; hygroscopic in air; colour deepens gradually on exposure to light. Sparingly soluble in dimethylformamide; very slightly

soluble in water or ethanol; freely soluble in acetic acid, hydrochloric acid or sodium hydroxide solution.

Melting range 218-224°C (Appendix VI C).

Identification (1) Dissolve a quantity of the substance being examined and norfloxacin CRS with a mixture of chloroform-methanol (1:1) respectively to produce two solutions of 2.5 mg per ml each. Carry out the thin-layer chromatography (Appendix V B) using silica gel G as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (15:10:3) as the mobile phase. Apply separately to the plate 10 μ l each of the solutions, after developing and removal of the plate, dry it in air. Examine under ultraviolet light (365 nm). The fluorescence and position of the principal spot in the chromatogram obtained with the substance being examined correspond to the principal spot obtained with reference solution.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of norfloxacin CRS.

Test (1) and (2) may be used alternatively.

Clarity of solution To 5 portions each of 0.5 g add 10 ml of sodium hydroxide TS respectively, the solutions are clear and colourless; Any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B).

Related substances Carry out the method as described under assay. Dissolve a quantity of the substance being examined with 0.1 mol/L hydrochloric acid solution (each 12.5 mg add 1 ml), and dilute with the mobile phase as described under Assay to produce solutions of 1 μ g per ml (solution 1) and 0.1 mg per ml (solution 2). Inject 20 μ l of solution (1) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. And then inject separately 20 μ l each of solution (1) and (2) into the column, and record the chromatogram for 2.5 times of the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (2) is not greater than the area of the principal peak in the chromatogram obtained with solution (1).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g and a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in g i : r n . 02 .

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.025 mol/L phosphoric acid solution (adjust pH to 3.1 \pm 0.1 with triethylamine)-acetonitrile (87:13) as the mobile phase. The flow rate is 0.8 ml per minute. The detection wavelength is 278 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of norfloxacin. The resolution factor between norfloxacin and adjacent peak of the impurities complies with the related requirements.

Procedure Dissolve about 25 mg of the substance being examined, accurately weighed, in a 100 ml volumetric flask with 2 ml of 0.1 mol/L hydrochloric acid solution. Dilute to volume with water, and mix well. Transfer 5 ml, accurately measured, to a 50 ml volumetric flask and dilute to volume with the mobile phase, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation,

using about 25 mg of norfloxacin CRS instead of the substance being examined. Calculate the content of $C_{16}H_{18}FN_3O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotic.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Norfloxacin Capsules
(2) Norfloxacin Cream
(3) Norfloxacin Eye Drops
(4) Norfloxacin Ointment

Norfloxacin Capsules

Norfloxacin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Description Capsules containing white to pale yellow powder.

Identification Complies with the test for identification described under norfloxacin.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at 45 minutes and filter. Transfer accurately 5 ml of the successive filtrate, to a 100 ml volumetric flask, dilute with the dissolution medium to volume and mix well. Measure the absorbance of the resulting solution at 280 nm (Appendix IV A); dissolve an accurately weighed quantity of theophylline CRS in hydrochloric acid solution (9→1000) to produce a solution of 5 µg per ml, measure the absorbance in the same manner. Calculate the dissolution of $C_{16}H_{18}FN_3O_3$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Transfer an accurately weighed quantity of the mixed contents of capsules obtained in the test for weight variation of contents, equivalent to about 125 mg of norfloxacin in a 500 ml volumetric flask, add 10 ml of 0.1 mol/L hydrochloric acid to dissolve, and dilute to volume with water, mix well and filter. Dilute 5 ml of the successive filtrate, accurately measure, to volume in a 50 ml of volumetric flask, mix well. Complete the Assay as described under Norfloxacin, using 20 µl of the resulting solution.

Category As described under Norfloxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Norfloxacin Eye Drops

Norfloxacin Eye Drops contain not less than 90.0% and not more than 110.0% of labelled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Description A colourless and clear solution.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of norfloxacin CRS.

(2) The light absorption of the solution of 5 µg per ml in phosphate buffer (pH 7.4) exhibits the maximum at 271 nm (Appendix IV A).

pH value 5.0-5.6 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Dilute a quantity, accurately measured, with mobile phase to produce a solution of about 25 µg per ml. Complete the Assay as described under Norfloxacin, using the resulting solution.

Category As described under Norfloxacin.

Strength 8 ml:24 mg

Storage Preserve in tightly closed containers and protected from light.

Norfloxacin Cream

Norfloxacin Cream contains not less than 90.0% and not more than 110.0% of labelled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Description A creamy yellow cream.

Identification (1) Evaporate 5 ml of the solution obtained in Assay to dryness on water bath. To the residue add 50 mg of malonic acid and 1 ml of acetic anhydride and heat on 80-90°C water bath for a few minutes, a reddish brown colour is produced.

(2) The light absorption of a solution containing 5 µg per ml in 0.4% sodium hydroxide solution exhibits the maximum at 273 nm (Appendix IV A).

Other requirements Comply with the general requirements for cream (Appendix I F).

Assay Mix well a quantity equivalent to about 4 mg of norfloxacin accurately weighed with 15 ml of chloroform in a separator. Extract with 25 ml, 20 ml, 20 ml and 10 ml of 0.1% sodium hydroxide solution saturated with sodium chloride separately. Transfer the extracts to 100 ml volumetric flask, dilute with sufficient 0.1% sodium hydroxide solution to volume, shake well and filter. Measure accurately 10 ml of the successive filtrate and add 0.4% sodium hydroxide solution to produce a solution of 5 µg per ml. Measure the absorbance of the resulting solution at 273 nm. Repeat the operation using the solution of 5 µg of norfloxacin CRS per ml in 0.4% sodium hydroxide solution instead of the solution of the substance being examined and calculate the content of $C_{16}H_{18}FN_3O_3$ accordingly.

Category As described under norfloxacin.

Strength (1) 10 g : 0.1 g (2) 250 g : 2.5 g

Storage Preserve in tightly closed container, stored in a dry place and protected from light.

Norfloxacin Ointment

Norfloxacin Ointment contains not less than 90.0% and not more than 110.0% of labelled amount of norfloxacin ($C_{16}H_{18}FN_3O_3$).

Description A yellow ointment.

Identification (1) Evaporate 5 ml of the solution obtained in Assay to dryness on water bath. To the residue add 50 mg of malonic acid and 1 ml of acetic anhydride and heat on 80–90°C water bath for a few minutes, a reddish brown colour is produced.

(2) The light absorption of a solution containing 5 µg per ml in 0.4% sodium hydroxide solution exhibits the maximum at 273 nm (Appendix IV A).

Other requirements Comply with the general requirements for ointment (Appendix I F).

Assay Mix well a quantity equivalent to about 4 mg of norfloxacin accurately weighed with 15 ml of chloroform in a separator, extract with 25 ml, 20 ml, 20 ml and 10 ml of 0.1% sodium hydroxide solution saturated with sodium chloride separately. Transfer the extracts to 100 ml volumetric flask, dilute with sufficient 0.1% sodium hydroxide solution to volume, shake well and filter. Measure accurately 10 ml of the successive filtrate and add 0.4% sodium hydroxide solution to produce a solution of 5 µg per ml. Measure the absorbance of the resulting solution at 273 nm. Repeat the operation using the solution of 5 µg of norfloxacin CRS per ml in 0.4% sodium hydroxide solution instead of the solution of the substance being examined and calculate the content of $C_{16}H_{13}FN_3O_3$ accordingly.

Category As described under norfloxacin.

Strength (1) 10 g : 0.1 g (2) 250 g : 2.5 g

Storage Preserve in tightly closed container, stored in a dry place and protected from light.

Norgestrel

$C_{21}H_{28}O_2$ 312.45

[6533-00-2]

Norgestrel is 13-ethyl-17 α -hydroxy-18, 19-dinorpregn-4-en-20-yn-3-one. It contains not less than 97.0% and not more than 103.0% of $C_{21}H_{28}O_2$.

Description A white or almost white crystalline powder; odourless; tasteless. Soluble in chloroform; slightly soluble in methanol; insoluble in water.

Melting range 204–212°C (Appendix VI C), melts within a range of 5°C.

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of norgestrel (Appendix XVI).

Ethynyl group Dissolve about 0.2 g, accurately weighed, in a 50 ml beaker with 20 ml of tetrahydrofuran, add 10 ml of 5% silver nitrate solution. Carry out the method for potentiometric titration (Appendix VII A). The indicator electrode is a glass electrode and the reference electrode is a saturated calomel electrode, using a saturated potassium

nitrate solution as the salt bridge. Titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 2.503 mg of $-C\equiv CH$. The content of ethynyl group is not less than 7.8% and not more than 8.2%.

Related substances Carry out the method as described under Assay. Dissolve a quantity with the mobile phase to produce a solution of about 75 µg per ml as solution 1, and dilute 2 ml of solution 1 to volume in a 100 ml volumetric flask with the mobile phase as solution 2. Inject 20 µl of solution 2 into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. And then, inject 20 µl each of solution 1 and 2 into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the area of all peaks other than the principal peak obtained with solution 1 is not greater than the area of the principal peak in the chromatogram obtained with solution 2.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (70:30) as the mobile phase. Detection wavelength is 240 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of norgestrel. The resolution factor between the peaks of norgestrel and the internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of megestrol acetate in acetonitrile to produce a solution of 1 mg per ml, mix well.

Procedure Dissolve 7.5 mg of norgestrel CRS, accurately weighed, in a 50 ml volumetric flask with the mobile phase, and dilute to column, mix well. Accurately measure 2 ml each of the above solution and the internal standard solution, mix well. Inject 20 µl of the resulting solution into the column. Repeat the operation, using the substance being examined instead of norgestrel CRS. Calculate the content of $C_{21}H_{28}O_2$ with respect to the peak area obtained in the chromatogram by internal standard method.

Category Progesteroide.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Compound Norgestrel Pills
(2) Compound Norgestrel Tablets
(3) Norgestrel and Quinestrol Tablets

Norgestrel and Quinestrol Tablets

Norgestrel and Quinestrol Tablets contain not less than 90.0% and not more than 115.0% of the labelled amount of norgestrel ($C_{21}H_{28}O_2$), and not less than 94.0% and not more than 115.0% of that of quinestrol ($C_{25}H_{32}O_2$).

Formula	Norgestrel	12 g
	Quinestrol	3 g

To make	1000 tablets
---------	--------------

Description Sugar or film coated tablets with white or almost white core.

Identification Powder and mix thoroughly 1 tablet with 5 ml of chloroform, filter, use the filtrate as the test solution. Mix the chloroform solution containing 1 mg each of

norgestrel CRS and quinestrol CRS as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and chloroform-methanol (9:1) as the mobile phase. Apply separately to the same plate 30 μ l each of the above two solutions. After developing and removal of the plate, dry it in air, spray with sulfuric acid-dehydrated ethanol (1:1), then heat at 105°C. The principal spots in the chromatogram obtained with the two solutions correspond in colour and position with respect to both ingredients.

Content uniformity Complies with the requirements for content uniformity (Appendix X E). Triturate 1 tablet, complete the operation as described under Assay from the beginning at the word "in a 50 ml volumetric flask".

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (80:20) as the mobile phase. Detection wavelength is 220 nm. The number of the theoretical is not less than 3000, calculated with reference to the peak of norgestrel. The resolution factors between the peaks of each component and the internal standard comply with the related requirements.

Internal standard solution Dissolve a quantity of progesterone caproate with acetonitrile to produce a solution of about 0.12 mg per ml.

Procedure Accurately weigh 20 tablets and powder. Accurately weigh a quantity, equivalent to about 12 mg of norgestrel, in a 50 ml volumetric flask, add a quantity of the mobile phase dissolve by ultrasonic generator, cool, and dilute to volume with the mobile phase, mix well, filter. Accurately measure 1 ml each of the successive filtrate and the internal standard solution, and mixture well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using a solution contained 0.12 mg of norgestrol and 0.06 mg of quinestrol prepared with norgestrol CRS and quinestrol CRS. Calculate the content of $C_{21}H_{28}O_2$ and $C_{25}H_{32}O_2$ respectively.

Category Progesteroïd.

Storage Preserved in tightly closed containers, protected from light.

Compound Norgestrel Pills

Compound Norgestrel pills contain not less than 0.270 mg and not more than 0.345 mg of norgestrel ($C_{21}H_{28}O_2$) and not less than 27.0 μ g and not more than 34.5 μ g of ethinylestradiol ($C_{20}H_{24}O_2$) in each pill.

Formula	Norgestrel	300 mg
	Ethinylestradiol	30 mg
to make		1000 pills

Description Sugar coated pills.

Identification (1) Remove the sugar coating of 1 pill, allow to disintegrate by warming with about 2 ml of ethanol and cool. Add 2 ml of alkaline trinitrophenol solution (mix 10 ml each of a 0.6% solution of trinitrophenol in ethanol, 7% sodium hydroxide solution and dilute ethanol immediately before use), and allow to stand for about 30 minutes. A

brownish-yellow colour is produced.

(2) Remove the sugar coating of 10 pills, allow to disintegrate by warming with 4 ml of water in a small beaker. Cool and transfer into a separator. Add 20 ml of ether, shake and allow to separate. Discard the water layer, wash the ethereal layer with water and filter through a funnel packed with anhydrous sodium sulfate and a wade of cotton wool. Evaporate the ether extract to dryness at low temperature over a water bath. Dissolve the residue in 0.3 ml of chloroform (solution 1). Dissolve a quantity of ethinylestradiol in chloroform to produce a solution of 1 mg per ml (solution 2). Carry out the method for thin-layer chromatograph (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (9:1) as the mobile phase. Apply separately to the plate 30 μ l each of the two solutions. After developing and removal of the plate, dry it in air and spray with sulfuric acid-dehydrated ethanol (1:1), then heat at 105°C for 10 minutes. The colour and position of the principal spots in the chromatogram obtained with the two solutions are identical.

Other requirements Comply with the general requirements for pills (Appendix I H).

Assay Remove the sugar coating of 10 pills, allow to disintegrate by warming with 12 ml of ethanol in a 20 ml volumetric flask. Cool to room temperature, dilute with ethanol to volume and mix well. Filter and use the successive filtrate as the test solution. Dissolve a quantity of norgestrel and ethinylestradiol CRS in acetonitrile to produce a solution of about 0.15 mg of norgestrel and 15 μ g of ethinylestradiol per ml as the reference solution.

Norgestrel Transfer separately 1 ml each of the test solution and reference solution, accurately measured, into two conical flasks with stopper. To each flask add exactly 3 ml of ethanol and 4 ml of alkaline trinitrophenol solution, allow to stand in the dark for 80 minutes and measure the absorbances at 490 nm (Appendix IV A). Calculate the content of $C_{21}H_{28}O_2$.

Ethinylestradiol Transfer separately 2 ml each of the test solution and reference solution, accurately measured, into two conical flasks with stopper, cool in an ice bath for 30 seconds. To each flask add exactly 8 ml of sulfuric acid-ethanol (4:1) with shaking, cool again in the ice bath for 30 seconds and then allow to stand at room temperature for 20 minutes, measure the absorbances at 530 nm (Appendix IV A). Calculate the content of $C_{20}H_{24}O_2$.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Compound Norgestrel Tablets

Compound Norgestrel Tablets contain 0.270-0.345 mg of norgestrel ($C_{21}H_{28}O_2$) and 27.0-34.5 μ g of ethinylestradiol ($C_{20}H_{24}O_2$) in each tablets.

Formula	Norgestrel	300 mg
	Ethinylestradiol	30 mg
To make		1000 tablets

Description Sugar or film coated tablets with white or almost white core.

Identification Pulverize 1 tablet, add 5 ml of chloroform and stir thoroughly, filter, evaporate 1 ml of the filtrate on a water bath to a volume of about 50 μ l as the test solution.

Evaporate 8 ml of the reference preparation obtained in the Assay to dryness on a water bath, cool, dissolve the residue in 1 ml of chloroform as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (9:1) as the mobile phase. Apply separately to the plate 50 μ l each of the two solutions mentioned above. After developing and removal of the plate, dry it in air and spray with sulfuric acid-dehydrated ethanol (1:1), then heat at 105°C. The colour and position of the principal spots in the chromatogram obtained with the test solution correspond to the principal spots obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (60:40) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of norgestrel. The resolution factor between the peaks of each component and the internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of megestrol acetate with acetonitrile to produce a solution of 1 mg per ml.

Procedure Weigh accurately and powder finely 20 tablets. Weigh accurately a quantity equivalent to about 1.5 mg of norgestrel to a 10 ml volumetric flask, adding 1 ml of internal standard solution and a quantity of the mobile phase and dissolving by ultrasonic generator, cool to room temperature, dilute to volume with the mobile phase, mix well, filter. Inject 20 μ l of the successive filtrate into the column. Prepare a solution of 1.5 mg of norgestrel CRS and 0.15 mg of ethinylestradiol CRS per ml in acetonitrile. Measure accurately 1 ml each of the solution and the internal standard solution to a 10 ml volumetric flask, dilute with the mobile phase, mix well. Inject 20 μ l of the resulting solution into the column. Calculate the content of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$.

Category Contraceptive.

Storage Preserve in tightly closed containers, protected from light.

Norvancomycin Hydrochloride

Norvancomycin hydrochloride is $(S_a)-(3S, 6R, 7R, 22R, 23S, 26S, 36R, 38aR)-44-[[2-O-(3-amino-2,3,6-trideoxy-3-C-methyl-\alpha-L-lyxo-hexopyranosyl)-\beta-D-glu-copyranosyl]oxy]-3-(carbamoylmethyl)-10,19-dichloro-2,3,4,5,6,7,23,24,25,26,36,37,38,38a-tetradecahydro-7,22,28,30,32-pentahydroxy-6-[(2R)-4-methyl-2-(amino) valer-amido]-2,5,24,38,39-pentaoxo-22H-8, 11:18,21-dietheno-23,36-(iminomethano)-13,16:31,35-dimetheno-1H,16H-[1,6,9] oxadiazacyclohexadecino [4,5-*m*] [10,2,16]-benzoxadiazacyclotetracosine-26-carboxylic acid, monohydrochloride. It contains not less than 88.0% of $C_{65}H_{73}Cl_2N_9O_{24}$, calculated on the anhydrous basis.$

Description A white to pale brown powder; odourless; taste bitter. Freely soluble in water; slightly soluble in methanol; insoluble in acetone, butanol or ether; precipitated by heavy metal salts in solution.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of Norvancomycin CRS in the chromatogram.

(2) The light absorption of a solution of 0.1 mg per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 282 nm (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity An aqueous solution of 50 mg per ml, pH 2.8-4.5 (Appendix VI H).

Clarity of solution To 5 portions add water respectively to produce solutions of 60 mg per ml, the solutions are clear; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Related substances Carry out the method as described under Assay. Dissolve a quantity in water to produce solution containing (1) 2 mg per ml and (2) 20 μ g per ml, respectively. Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Inject separately 20 μ l each of solution (1) and (2) into the column and record the chromatograms. The area of any impurity peak in the chromatogram obtained with the solution (1) is not greater than that of the principal peak in the chromatogram obtained with solution (2) (not more than 4%).

Water Not more than 7.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 1.0% (Appendix VIII N).

Pyrogens Complies with the test for pyrogens (Appendix IX D), using a solution of 20000 Units per ml in Sterile Water for Injection, inject 0.5 ml per kg of rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion and transfer to at least 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D) using a column packed with octadecylsilane bonded silica gel, a mixture of Triethylamine buffer (Mix 6 ml of triethylamine and 2000 ml of water, and adjust with phosphoric acid to pH 3.2), acetonitrile, and tetrahydrofuran (96:3:1) as the mobile phase A, and a mixture of Triethylamine buffer, acetonitrile, and tetrahydrofuran (20:20:1) as the mobile

phase B. The flow rate is 1.0 ml per minute and elute linear gradient. Detection wavelength is 280 nm. Changing the acetonitrile proportion in mobile phase A to obtain a retention time of 18 minutes to 22 minutes for the main norvancomycin peak, and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the main peak of norvancomycin.

Time (min)	mobile phase A (percent V/V)	mobile phase B (percent V/V)
0	100	0
23	100	0
38	-	-
40	0	100
41	100	0
50	100	0

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in water to produce a solution of 1 mg per ml. Inject 20 μ l of the above solution into the column. Repeat the operation, using norvancomycin CRS instead of the substance being examined. Calculate the content of $C_{65}H_{73}Cl_2N_9O_{24}$. 1000 Norvancomycin Units is equivalent to 1 mg $C_{65}H_{73}Cl_2N_9O_{24}$ with respect the peak area obtained in the chromatogram by external standard method.

Category Peptide Antibiotic.

Storage Preserve in hermetically sealed containers stored in a cool and dark place.

Preparation Norvancomycin Hydrochloride for Injection

Norvancomycin Hydrochloride for Injection

Norvancomycin Hydrochloride for injection is a sterile powder or lyophilized preparation of norvancomycin hydrochloride. It contains not less than 88.0% of norvancomycin ($C_{65}H_{73}Cl_2N_9O_{24}$), calculated on the anhydrous basis. It contains not less than 90.0% and not more than 110.0% of the labelled amount of norvancomycin, calculated with reference to the average weight of contents.

Description A white to pale brown powder or lyophilized mass.

Identification Comply with the tests for Identification described under Norvancomycin Hydrochloride.

Clarity of solution To each of 5 containers add water to produce solutions of 50 mg per ml, the solutions are clear; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Water Not more than 7.0% (Appendix VIII M, method 1).

Acidity, Related substances, Residue on ignition, Pyrogens, Sterility Comply with the corresponding requirements described under Norvancomycin Hydrochloride.

Other requirements Comply with the general requirements for injections (Appendix I B) except that the weight variation of contents is not greater than $\pm 7\%$.

Assay Carry out the method described under Assay of Norvancomycin Hydrochloride, using an accurately weighed quantity of the mixed contents obtained from the test for

weight variation of contents.

Category As described under Norvancomycin hydrochloride.

Strength 0.4 g (400000 norvancomycin Units, calculated as $C_{65}H_{73}Cl_2NaO_{24}$)

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Noscapine

$C_{22}H_{23}NO_7$ 413.43

[128-62-1]

Noscapine is 6,7-dimethoxy-3-(5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-g]isoquinolin-5-yl), [*S*-(*R**, *S**)]-(3*H*)-isobenzofuranone. It contains not less than 99.0% of $C_{22}H_{23}NO_7$, calculated on the dried basis.

Description A white crystalline powder or prismatic crystals with lustrous; odourless.

Freely soluble in chloroform; sparingly soluble in benzene; slightly soluble in ethanol or ether; practically insoluble in water.

Melting point 174-177°C (Appendix VI C).

Specific optical rotation +42° to +48°, in a solution of 20 mg per ml in 0.1 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve 1 mg in 1 drop of sulfuric acid, a yellow green colour is produced; the colour changes to red on warming and turns to violet finally.

(2) To about 1 mg add 1 drop of molybdenum sulfuric acid TS, a deep green colour is produced, and changes gradually to purple-red on warming.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of noscapine (Appendix XVI).

Clarity and colour of solution in acetone A solution of 0.2 g in 10 ml of acetone is clear and colourless; any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of acetone-toluene-ethanol-concentrated ammonia solution (20:20:3:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in acetone containing (1) 25 mg per ml, (2) 0.125 mg per ml. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII

N).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes from pink to blue. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 41.34 mg of $C_{22}H_{23}NO_7$.

Category Antitussive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Noscapine Tablets

Noscapine Tablets

Noscapine Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of noscapine ($C_{22}H_{23}NO_7$).

Description Sugar coated tablets with white core.

Identification To a quantity of the powdered tablets equivalent to about 20 mg of noscapine add 10 ml of chloroform. Stir to dissolve the noscapine and filter, evaporate the filtrate on a water bath to dryness. The residue complies with tests (1) and (2) for Identification described under Noscapine.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with a quantity of ethanol and transfer to a 50 ml volumetric flask, shake thoroughly to dissolve the noscapine. Dilute with ethanol to volume, mix well and filter. Transfer accurately 5 ml of the successive filtrate into a 25 ml volumetric flask, dilute with ethanol to volume and mix well, use as the test solution. Dissolve a quantity of noscapine CRS in ethanol, accurately measured, to produce the reference solution of 40 µg per ml. Measure the absorbance of the test and reference solution at 310 nm (Appendix IV A). Calculate the content of $C_{22}H_{23}NO_7$ in each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 30 tablets with sugar coating removed. To a quantity, accurately weighed, of the powdered tablets equivalent to about 0.1 g of noscapine add 20 ml of chloroform, shake to dissolve noscapine and filter. Wash the container and filter with 5 ml each of chloroform for 8 times. Combine the filtrate and the washings, add 10 ml of glacial acetic acid and 1 drop of crystal violet IS. Titrate with perchloric acid (0.05 mol/L) VS until the colour turns to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS is equivalent to 20.67 mg of $C_{22}H_{23}NO_7$.

Category, Storage As described under Noscapine.

Strength 10 mg

Ofloxacin

$C_{18}H_{20}FN_3O_4$ 361.38

Ofloxacin is (±)-9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid. It contains not less than 98.5% of $C_{18}H_{20}FN_3O_4$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder; odourless; taste, bitter; colour deepens gradually on exposure to light.

Sparingly soluble in chloroform; slightly soluble in methanol; freely soluble in glacial acetic acid; sparingly soluble in dilute acid solution or 0.1 mol/L sodium hydroxide solution.

Specific optical rotation -1° to 1° , in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve an accurately weighed quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the test solution. Prepare the reference solution using ofloxacin CRS instead of the substance being examined in the same manner. Carry out the method for high performance liquid chromatography as described under the Related substances. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of ofloxacin CRS in the chromatogram.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ofloxacin (Appendix XVI).

Clarity of solution Dissolve 0.50 g in 10 ml of sodium hydroxide TS, the solution is clear; an opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B).

Light absorption Dissolve 0.1 g in 10 ml of sodium hydroxide TS, the absorbance at 450 nm (Appendix IV B) is not more than 0.25.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchlorate in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Dissolve a quantity of ofloxacin in 0.1 mol/L hydrochloric acid solution to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 µl of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Dissolve an accurately weighed quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 1.2

mg per ml as the test solution. Accurately measure a quantity of above solution in 0.1 mol/L hydrochloric acid solution to produce a solution of 2.4 µg per ml as the reference solution. Inject 10 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject 10 µl of the test solution and the reference solution separately into the column, and record the chromatogram for 2.5 times the retention time of the principal peak. The area of any peak other than the principal peak is not greater than the peak area of ofloxacin in the reference solution (0.2%). The sum of the areas of all the peaks other than the principal peak (disregard any peak with an area less than 0.05 times of the peak area of ofloxacin in the reference solution) is not greater than 2.5 times of the peak area of ofloxacin in the reference solution (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g in a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.75 EU per mg (for injection).

Assay Dissolve about 0.2 g, accurately weighed, in 50 ml of glacial acetic acid, carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 36.14 mg of $C_{18}H_{20}FN_3O_4$.

Category Antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ofloxacin and Sodium Chloride Injection
(2) Ofloxacin Capsules
(3) Ofloxacin Ear Drops
(4) Ofloxacin Eye Drops
(5) Ofloxacin Eye Ointment
(6) Ofloxacin Tablets

Ofloxacin and Sodium Chloride Injection

Ofloxacin and Sodium Chloride Injection is a sterile and isotonic solution of ofloxacin and sodium chloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$) and sodium chloride (NaCl).

Description A clear, pale yellow green liquid.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ofloxacin CRS.

(2) Yields the reactions characteristic of chlorides (Appendix III).

(3) Yields the reactions characteristic of sodium salts (Appendix III).

pH value 3.5-7.5 (Appendix VI H).

Light absorbance The absorbance at 450 nm (Appendix IV

A) is not more than 0.03.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D). The chromatography conditions and system suitability test are the same as described under the Related substances of Ofloxacin.

Procedure Dissolve an accurately measured quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 1.2 mg per ml as the test solution. Dissolve an accurately measured quantity in 0.1 mol/L hydrochloric acid to produce a solution of 2.4 µg per ml as the reference solution. The area of any peak other than the principal peak is not greater than the peak area of ofloxacin in the reference solution (0.2%). The sum of the areas of all the peaks other than the principal peak (disregard any peak less than 0.05 times of the peak area of ofloxacin in the reference solution) is not greater than 2.5 times of the peak area of ofloxacin in the reference solution (0.5%).

Heavy metals Evaporate 20 ml on a water bath to dryness. Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue; not more than 0.0001%.

Particulate matter Complies with the test for particulate matter in injections (Appendix IX C), using one container.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per ml.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method), to each portion not more than 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Ofloxacin Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchloric in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Measure accurately a quantity of ofloxacin in 0.1 mol/L hydrochloric acid solution to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 µl of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Inject 10 µl of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Sodium chloride Measure accurately 10 ml, add 30 ml of water, 5 ml of dextrin solution (1→50) and 5-3 drops of fluorescein IS, mix well, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of sodium chloride (NaCl).

Category As described under Ofloxacin.

Strength 100 ml : 0.2 g of ofloxacin and 0.9 g of sodium chloride

Storage Preserve in tightly closed containers, protected from light

Ofloxacin Capsules

Ofloxacin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Description Capsules containing white or slightly yellow power or granules.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of ofloxacin CRS in the chromatogram.

(2) Dissolve a quantity of the contents in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 µg of ofloxacin per ml, filter. The light absorption of the filtrate exhibits a maximum at 294 nm (Appendix IV A).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D). The chromatography conditions and system suitability test are the same as described under the Related substances of Ofloxacin.

Procedure Take the stored test solution as described under the Assay as the test solution. Dissolve an accurately measured quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 µg per ml as the reference solution. The area of any peak other than the principle peak is not greater than the peak area of ofloxacin in the reference solution (0.5%). The sum of the areas of all peaks other than the principle peak (disregard any peak less than 0.05 times of the peak area of ofloxacin in the reference solution) is not greater than twice of the peak area of ofloxacin in the reference solution (1.0%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9→1000) to 50 ml and mix well. Measure the absorbance of the resulting solution of $C_{18}H_{20}FN_3O_4$ from each capsule. Dissolve an accurately weighed quantity of ofloxacin CRS, in hydrochloric acid solution (9→1000) to produce a solution of 4.5 µg per ml. Repeat the operation, using the reference solution instead of the test solution. Calculate the dissolution of $C_{18}H_{20}FN_3O_4$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchloric as the mobile phase in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85:15) as the mobile phase, detection wavelength is 294 nm. Dissolve a quantity of ofloxacin in 0.1 mol/L hydrochloric acid solution to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 µl of the solution into the column, the number of the theoretical plate of the peak of ofloxacin is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the

Procedure Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of content, equivalent to about 120 mg of ofloxacin in a 100 ml volumetric flask with 0.1 mol/L hydrochloric acid solution, dilute to volume, mix well and filter, use the successive filtrate as stored test solution. Measure accurately 5 ml in a 50 ml volumetric flask, dilute to volume with 0.1 mol/L hydrochloric acid and mix well as the test solution. Inject 10 µl of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Measure the reference solution as the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ofloxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Ofloxacin Ear Drops

Ofloxacin Ear Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Description A clear, slightly yellow liquid.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of ofloxacin CRS in the chromatogram.

(2) Dilute a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 µg of ofloxacin per ml. The light absorption of the solution exhibits a maximum at 294 nm (Appendix IV A).

pH value 6.0-7.0 (Appendix VI H).

Absorbance The light absorption of the solution obtained from Identification (2) is not more than 0.04 at 450 nm (Appendix IV A).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D). The chromatography conditions and system suitability test are the same as described under the Related substances of Ofloxacin.

Procedure Dilute accurately a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 1.2 mg per ml as the test solution. Accurately measure a quantity, dilute with 0.1 mol/L hydrochloric acid solution to produce a solution of 2.4 µg per ml as the reference solution. The area of any peak other than the principal peak is not greater than the peak area of ofloxacin in the reference solution (1.0%). The sum of the areas of all the peaks other than the principal peak (disregard any peak less than 0.05 times of the peak area of ofloxacin in the reference solution) is not greater than twice times of the peak area of ofloxacin in the reference solution (2.0%).

Other requirements Comply with the general requirements for ear preparations (Appendix I Q).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of

acetate and 7.0 g of sodium perchlorate in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Measure a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 μ l of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Measure accurately 2 ml, equivalent to about 6 mg of ofloxacin in 0.1 mol/L hydrochloric acid solution in a 50 ml volumetric flask, dilute to volume, mix well and filter, using the successive filtrate as the test solution. Inject 10 μ l of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ofloxacin.

Strength 5 ml:15 mg

Storage Preserve in tightly closed containers, protected from light.

Ofloxacin Eye Drops

Ofloxacin Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Description A clear, slightly yellow liquid.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of ofloxacin CRS in the chromatogram.

(2) Measure a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 μ g of ofloxacin per ml. The light absorption of the solution exhibits a maximum at 294 nm (Appendix IV A).

pH value 6.0-7.0 (Appendix VI H).

Absorbance The light absorption of the solution obtained from Identification (2) is not more than 0.04 at 450 nm (Appendix IV A).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D). The chromatography conditions and system suitability test are the same as described under the Related substances of Ofloxacin.

Procedure Measure accurately a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 1.2 mg per ml as the test solution. Measure accurately a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 μ g per ml as the reference solution. The area of any peak other than the principal peak is not greater than the peak area of ofloxacin in the reference solution (0.5%). The sum of areas of all peaks other than the principal peak (disregard any peak less than 0.05 times of the peak area of ofloxacin in the reference solution) are not greater than twice the peak

Other requirements Comply with the general requirements for eye preparations (Appendix I Q).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchloric in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Dissolve a weighed quantity of ofloxacin in 0.1 mol/L hydrochloric acid to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 μ l of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Measure accurately 2 ml, equivalent to about 6 mg of ofloxacin in 0.1 mol/L hydrochloric acid solution in a 50 ml volumetric flask, dilute to volume, mix well and filter as the test solution. Inject 10 μ l of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ofloxacin.

Strength (1) 5 ml:15 mg (2) 8 ml:24 mg
(3) 10 ml:30 mg

Storage Preserve in tightly closed containers, protected from light.

Ofloxacin Eye Ointment

Ofloxacin Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Description White to yellow ointment or pale yellow gel base ointment.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of ofloxacin CRS in the chromatogram.

(2) Dissolve a quantity in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 μ g of ofloxacin per ml, filter. The light absorption of the filtrate exhibits a maximum at 294 nm (Appendix IV A).

Other requirements Complies with the general requirements for eye preparation (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchloric in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Dissolve a weighed quantity of ofloxacin in 0.1 mol/L hydrochloric acid solution to produce

(254 nm) for four hours. Inject 10 μ l of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Dissolve an accurately weighed quantity of about 2 g of the Ofloxacin Eye Ointment in 40 ml petroleum ether, shake and extract for three times using 15 ml of 0.1 mol/L hydrochloric acid each time in a 50 ml volumetric flask, dilute to volume using 0.1 mol/L hydrochloric acid solution, mix well and filter, as the stored test solution. Measured accurately 5 ml in a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution and mix well as the test solution. Inject 10 μ l of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ofloxacin.

Strength (1) 0.25 g \pm 0.75 mg (2) 2 g \pm 6 mg
(3) 3.5 mg \pm 10.5 mg

Storage Preserve in tightly closed containers, protected from light.

Ofloxacin Tablets

Ofloxacin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ofloxacin ($C_{18}H_{20}FN_3O_4$).

Description Almost white or slightly yellow tablets or film coated tablets with almost white to slightly yellow core.

Identification (1) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of ofloxacin CRS.

(2) Dissolve a quantity of the powdered tablets in 0.1 mol/L hydrochloric acid solution to produce a solution of 6 μ g of ofloxacin per ml, filter. The light absorption of the filtrate exhibits a maximum at 294 nm (Appendix IV A).

Related substances Carry out the method for high performance liquid chromatography (Appendix VI D). The chromatography conditions and system suitability test are the same as described under the Related substances of Ofloxacin.

Procedure Take the stored test solution as described under the Assay as the test solution. Measured accurately 5 ml in a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to produce a solution of 6 μ g per ml as the reference solution. The area of any peak other than the principal peak is not greater than the peak area of ofloxacin in the reference solution (0.5%). The sum of the areas of all peaks other than the principal peak (disregard any peak less than 0.05 times of the peak area of ofloxacin in the reference solution) is not greater than twice of the peak area of ofloxacin in the reference solution (1.0%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9 \rightarrow 1000) to 50 ml and mix well. Measure the absorbance of the

(Appendix IV A). Dissolve an accurately weighed quantity of ofloxacin CRS, in hydrochloric acid solution (9 \rightarrow 1000) to produce a solution of 4.5 μ g per ml. Repeat the operation. Calculate the dissolution of $C_{18}H_{20}FN_3O_4$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium acetate solution (dissolve 4.0 g of ammonium acetate and 7.0 g of sodium perchloric in 1300 ml of water, mix well, and adjust pH to 2.2 with phosphate acid)-acetonitrile (85 : 15) as the mobile phase, detection wavelength is 294 nm. Dissolve a weighed quantity of ofloxacin in 0.1 mol/L hydrochloric acid to produce a solution of 1 mg per ml, lighted under ultraviolet light (254 nm) for four hours. Inject 10 μ l of the solution into the column, the number of the theoretical plate of the column is not less than 5000, calculated with reference to the peak of ofloxacin. The resolution factor between the peak of ofloxacin and that of the adjacent impurity in front of the peak of ofloxacin complies with the related requirements.

Procedure Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 120 mg of ofloxacin in a 100 ml volumetric flask, dilute to volume, mix well and filter, as the stored test solution. Measured accurately 5 ml in a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution and mix well as the test solution. Inject 10 μ l of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ofloxacin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 0.12 mg per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{20}FN_3O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ofloxacin.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Omeprazole

$C_{17}H_{19}N_3O_3S$ 345.42

[73590-58-6]

Omeprazole is 5-methoxy-2-[[[4-methoxy-3,5-dimethyl-2-pyridinyl]methyl]sulfinyl]-1H-benzimidazole. It contains not less than 98.5% of $C_{17}H_{19}N_3O_3S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; The colour deepened on exposure to light. Freely soluble in dichloromethane; sparingly soluble in methanol or in ethanol; slightly soluble in acetone; insoluble in water; soluble in 0.1 mol/L sodium hydroxide solution.

sodium hydroxide solution, add 1 ml of silicotungstic acid TS, mix well, add a few drops of dilute hydrochloric acid; a white flocculent precipitate is produced immediately.

(2) The light absorption of a solution of about 15 µg per ml in 0.1 mol/L sodium hydroxide solution exhibits maxima at 276 nm and 305 nm, and minima at 256 nm and 281 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of omeprazole (Appendix XVI).

Clarity and colour of dichloromethane solution Dissolve 0.5 g in 25 ml of dichloromethane, the solution is clear and colourless; any colour is produced, measure the absorbance at 440 nm (Appendix IV A). The absorbance is not greater than 0.10.

Related substance Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane silica gel and a mixture of 0.01 mol/L disodium hydrogen phosphate solution (adjust to pH 7.6 with phosphoric acid)-acetonitrile (75 : 25) as the mobile phase. Detection wavelength is 280 nm. Dissolve an accurately weighed quantity of the substance being examined in mobile phase to produce a solution of 0.2 mg per ml as the test solution and a solution of 2 µg per ml as the reference solution; Dissolve 1 mg of omeprazole CRS and 1 mg of omeprazole sulphone (5-methoxy-2 [[(4-methoxy-3, 5-dimethyl-2-pyridinyl) methyl] -sulphonyl] -1H-benzimidazole) CRS in 10 ml of mobile phase, shake thoroughly. Inject 20 µg of the resulting solution into the column, the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of omeprazole; the resolution factor between omeprazole and omeprazole sulphone is greater than 2.0. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 15% full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for three times the retention time of the principal peak. Each secondary peak and the sum of the secondary peaks other than the principal peak are not greater than 3/10 or the area of the principal peak in the chromatogram obtained with reference solution respectively.

Residual solvents Dissolve 0.5 g, accurately weighed, in 3 ml of dimethylacetamide in a head-space vial (as the test solution). Weigh accurately a quantity of dichloromethane, acetonitrile, methanol and acetone, dissolve in dimethylacetamide to produce a solution containing 100 µg, 60 µg, 160 µg per ml correspondingly, as the reference solution. Measure accurately 3 ml of the reference solution to a head-space vial. Carry out the test for Residual solvents (Appendix VIII P, method 2), using a column packed with polyethylene glycol 20 M as the stationary phase. Maintain the column temperature at 45°C for 8 minutes, then raising the temperature at a rate of 45°C per minute to 200°C. Comply with the related requirements of Residual solvents.

Loss on drying when dried in vacuum at 60°C for 4 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Weigh accurately about 0.2 g, dissolve in 50 ml of a solution of ethanol-water (4:1). Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium

hydroxide (0.1 mol/L) VS is equivalent to 34.54 mg of $C_{17}H_{19}N_3O_3S$.

Category Proton pump inhibitor.

Storage Preserve in tightly closed containers, stored in a cold place, protected from light.

Preparation (1) Omeprazole Enteric-coated Tablets
(2) Omeprazole Enteric-coated Capsules

Omeprazole Enteric-coated Capsules

Omeprazole Enteric-coated capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of omeprazole ($C_{17}H_{19}N_3O_3S$).

Description Capsules containing white or almost white small enteric-coated pills or granules.

Identification (1) To a quantity of powdered contents, equivalent to about 10 mg of omeprazole, add 20 ml of 0.1 mol/L sodium hydroxide solution, shake to dissolve omeprazole, filter. Add 1 ml of silicotungstic acid TS to 3 ml of the filtrate, mix well. Add a few drops of dilute hydrochloric acid; a white flocculent precipitate is produced immediately.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution correspondingly.

(3) To a quantity of the powdered contents, add 0.1 mol/L sodium hydroxide solution to produce a solution of 15 µg per ml and filter. The light absorption of the filtrate exhibits maxima at 276 nm and 305 nm, and minima at 256 nm and 281 nm (Appendix IV A).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 capsule (for strength 10 mg) to a 50 ml volumetric flask, add a quantity of phosphate BS (Mix 110 ml of 0.25 mol/L sodium phosphate solution with 220 ml of 0.5 mol/L disodium hydrogen phosphate solution, dilute with water to 1000 ml and mix well, adjust to pH 11.0), disintegrated by ultrasonication, add 10 ml of ethanol, ultrasonicate for 15 minutes, cool to room temperature, dilute with phosphate BS (pH 11.0) to volume and mix well, filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with water to volume and mix well. Carry out the method as described under the Assay, calculate the content of $C_{17}H_{19}N_3O_3S$.

Drug Release Carry out the method for dissolution test (Appendix X D, method 2 and X C, method 2), using 500 ml of sodium chloride in hydrochloric acid solution (To 1 g of sodium chloride add 3.5 ml of hydrochloric acid, dilute to 500 ml with water) as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Stop rotating at 120 minutes, neither the enteric-coated granules nor the solvent discolour obviously. Add 400 ml of 0.235 mol/L of disodium hydrogen phosphate solution previously heated to 37°C in the vessel immediately, keep the same rotational speed as above. Withdraw the sample at 45 minutes and filter. To 5 ml of the successive filtrate, accurately measured, add 1.0 ml of 0.25 mol/L sodium hydroxide solution, mix well, taking, the resulting solution as test solution. Dissolve about 20 mg of omeprazole CRS, accurately weighed, with 10 ml of ethanol in a 100 ml volumetric flask, dilute with the mixed dissolution medium [sodium chloride in hydrochloric acid solution -0.235 mol/L of disodium hydrogen phosphate solution (5:4)] to volume.

mix well. Transfer accurately 5 ml of the solution to a 50 ml (for 20 mg) or to a 100 ml (for 100 mg) volumetric flask, dilute with the mixed dissolution medium to volume, mix well. To 5 ml of the solution, accurately measured, add 1.0 ml of 0.25 mol/L sodium hydroxide solution and mix well, taking the resulting solution as reference solution. Carry out the method as described under the Assay, calculate the dissolution of $C_{17}H_{19}N_3O_3S$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane silica gel and a mixture of 0.01 mol/L disodium hydrogen phosphate solution (adjust to pH 7.6 with phosphoric acid)-acetonitrile (75 : 25) as the mobile phase. Detection wavelength is 302 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of omeprazole.

Procedure Weigh accurately and powder the contents of 20 capsules, weigh accurately a quantity equivalent to about 20 mg of omeprazole into a 100 ml volumetric flask, add 20 ml of ethanol and about 60 ml of phosphate BS (pH 11.0), treated with aid of ultrasonicator to dissolve omeprazole, dilute with phosphate BS (pH 11.0) to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with water to volume, mix well. Inject 20 μ l of the resulting solution into the column, record the peak areas obtained in the chromatogram. Weigh accurately about 20 mg of omeprazole CRS into a 100 ml volumetric flask, repeat the operation, beginning at the words "add 20 ml of ethanol and about 60 ml of phosphate BS (pH 11.0)...", calculate the content of $C_{17}H_{19}N_3O_3S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Omeprazole.

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers, stored in a dry place, protected from light.

Omeprazole Enteric-coated Tablets

Omeprazole Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of omeprazole ($C_{17}H_{19}N_3O_3S$).

Description Enteric-coated tablets with white or almost white core.

Identification (1) To a quantity of the powdered tablets, equivalent to about 10 mg of omeprazole, add 20 ml of 0.1 mol/L sodium hydroxide solution, shake to dissolve omeprazole, filter. To 3 ml of the filtrate, add 1 ml of silicotungstic acid TS, mix well, add a few drops of dilute hydrochloric acid; a white flocculent precipitate is produced immediately.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution correspondingly.

(3) To a quantity of the powdered tablets, add 0.1 mol/L sodium hydroxide solution to produce a solution of 15 μ g per ml and filter. The light absorption of the filtrate exhibits maxima at 276 nm and 305 nm, and minima at 256 nm and

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet (for 10 mg) to a 50 ml volumetric flask, add a quantity of phosphate BS (Mix 110 ml of 0.25 mol/L sodium phosphate solution with 220 ml of 0.5 mol/L disodium hydrogen phosphate solution, dilute with water to 1000 ml and mix well, adjust pH to 11.0), disintegrate by ultrasonicator, add 10 ml of ethanol, in ultrasonicate bath for 15 minutes, cool to room temperature, dilute with phosphate BS (pH 11.0) to volume and mix well, filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with water to volume and mix well. Carry out the method as described under the Assay, calculate the content of $C_{17}H_{19}N_3O_3S$.

Drug Release Carry out the method for dissolution test (Appendix X D, method 2 and X C, method 1), using 500 ml of sodium chloride in hydrochloric acid solution (To 1 g of sodium chloride add 3.5 ml of hydrochloric acid, dilute to 500 ml with water) as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Stop rotating at 120 minutes, elevate the basket from the liquid immediately, no table discolours, cracks or disintegrates. Add 400 ml of 0.235 mol/L of disodium hydrogen phosphate solution previously heated to 37°C in the vessel immediately, replace the basket into the new dissolution medium, keep the same rotational speed as above. Withdraw the sample at 45 minutes and filter. To 5 ml of the successive filtrate, accurately measured, add 1.0 ml of 0.25 mol/L sodium hydroxide solution, mix well, taking the resulting solution as test solution. Dissolve about 20 mg of omeprazole CRS, accurately weighed, with 10 ml of ethanol in a 100 ml volumetric flask, dilute with the mixed dissolution medium [sodium chloride in hydrochloric acid solution-0.235 mol/L of disodium hydrogen phosphate solution (5:4)] to volume, mix well. Transfer accurately 5 ml of the solution to a 50 ml (for strength 20 mg) or to a 100 ml (for strength 10 mg) volumetric flask, dilute with the mixed dissolution medium to volume, mix well. To 5 ml of the solution, accurately measured, add 1.0 ml of 0.25 mol/L sodium hydroxide solution and mix well, taking the resulting solution as reference solution. Carry out the method as described under the Assay, calculate the dissolution of $C_{17}H_{19}N_3O_3S$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane silica gel and a mixture of 0.01 mol/L disodium hydrogen phosphate solution (adjust to pH 7.6 with phosphoric acid)-acetonitrile (75 : 25) as the mobile phase. Detection wavelength is 302 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of omeprazole.

Procedure Weigh accurately and powder 20 tablets, weigh accurately a quantity, equivalent to about 20 mg of omeprazole, into a 100 ml volumetric flask, add 20 ml of ethanol and about 60 ml of phosphate BS (pH 11.0), treated with aid of ultrasonicator to dissolve omeprazole, dilute with phosphate BS (pH 11.0) to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in a 50 ml volumetric flask, dilute with water to volume, mix well. Inject 20 μ l of the resulting solution into the column, record the peak areas obtained in the chromatogram. Weigh accurately about 20 mg of omeprazole CRS into a 100 ml volumetric flask, repeat the operation, beginning at the words "add 20 ml of ethanol and about 60 ml of phosphate BS (pH 11.0)...", calculate the content of

$C_{17}H_{19}N_3O_3S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Omeprazole.

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed container, stored in a cool and dry place, protected from light.

Ondansetron Hydrochloride

$C_{18}H_{19}N_3O \cdot \text{HCl} \cdot 2\text{H}_2\text{O}$ 365.86 [103639-04-9]

Ondansetron Hydrochloride is (\pm) -2,3-Dihydro-9-methyl-3-[(2-methylimidazol-1-yl)methyl]carbazol-4(1*H*)-one monohydrochloride dihydrate. It contains not less than 98.0% and not more than 102.0% of $C_{18}H_{19}N_3O \cdot \text{HCl}$, calculated on the anhydrous basis.

Description White or almost white crystalline powder; odourless; taste, bitter. Freely soluble in methanol; sparingly soluble in water; slightly soluble in acetone; sparingly soluble in 0.1 mol/L hydrochloric acid solution.

Melting range 175-180°C, with decomposition (Appendix VI C), determined after drying over phosphorous pentoxide for 30 minutes.

Identification (1) Dissolve about 10 mg in 5 ml of water, add 1 ml of dilute potassium iodobismuthate TS, a scarlet colour is produced.

(2) The light absorption of a solution of 10 μg per ml in 0.1 mol/L hydrochloric acid solution exhibits maxima at 248 nm, 267 nm and 310 nm, and minima at 282 nm and 257 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ondansetron hydrochloride (Appendix XVI).

(4) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.0-5.5 (Appendix VI H).

Clarity and colour of solution Dissolve 0.1 g in 10 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y1 (Appendix IX A).

Related substances Carry out the method as described under Assay, except the detection wavelength is 216 nm. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 0.5 mg per ml as test solution. Transfer accurately 1 ml of the resulting solution, into a 100 ml volumetric flask, dilute with mobile phase to produce a solution of 5 μg per ml as reference solution. Inject 10 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% to 15% full scale of the chart. Inject separately 20 μl each of the test solution and the reference solution into the column, and record the

chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than 1/2 area of the principal peak in the chromatogram obtained with the reference solution.

Toluene and acetone Dissolve a quantity of the substance being examined, accurately weighed, in water to produce a solution of 20 mg per ml as test solution; Dissolve an accurately weighed quantity of toluene and acetone in water, to produce a solution of 17.8 μg per ml of toluene and 100 μg per ml of acetone as reference solution. Comply with the test for residual solvents (Appendix VIII P, method 3), using a capillary column packed with phenyl (5%)—methyl polysiloxane (95%) as the stationary phase, and maintain the column temperature at 50°C. The detector is FID. The resolution factor between the peaks of toluene and acetone complies with the related requirements. Inject separately 1 to 3 μl each of the test solution and the reference solution into the column, and record the chromatograms, calculate the content of toluene and acetone with respect to the peak area obtained in the chromatogram by the external standard method.

Water 9.0%-10.5% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with cyano silane group bonded silica gel and a mixture of 0.02 mol/L sodium dihydrogen phosphate solution (adjust to pH 5.4 with sodium hydroxide TS)-acetonitrile (50:50) as the mobile phase. Detection wavelength is 310 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of ondansetron hydrochloride.

Procedure Dissolve an accurately weighed quantity of the substance being examined, in mobile phase to produce a solution of 0.1 mg per ml. Inject 10 μl of the resulting solution into the column. Repeat the operation, using ondansetron hydrochloride CRS instead of the substance being examined, calculate the content of $C_{18}H_{19}N_3O \cdot \text{HCl}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antiemetics for sickness caused by chemotherapy and radiotherapy.

Storage Preserve in tightly closed container, protected from light.

Preparation (1) Ondansetron Hydrochloride Tablets
(2) Ondansetron Hydrochloride Injection

Ondansetron Hydrochloride Injection

Ondansetron Hydrochloride Injection is a sterile solution of Ondansetron Hydrochloride in Water for Injection. It contains not less than 97.0% and not more than 107.0% of the labelled amount of ondansetron ($C_{18}H_{19}N_3O$).

Description A clear, colourless liquid.

Identification (1) The retention time of principal peak of ondansetron hydrochloride in the substance being examined in

the chromatogram obtained in the Assay is identical with that of the principal peak of ondansetron hydrochloride CRS in the chromatogram of the reference solution correspondingly.

(2) The light absorption of a solution of 10 µg per ml in 0.1 mol/L hydrochloric acid solution exhibits maxima at 248 nm, 267 nm and 310 nm, and minima at 282 nm and 257 nm (Appendix IV A).

(3) Yields the reactions characteristic of chlorides (Appendix III).

pH value 3.0-4.0 (Appendix VI H).

Related substances Carry out the method as described under Assay except the detection wavelength is 216 nm. To a quantity of the injection add mobile phase to produce a solution of 0.5 mg per ml as test solution. Measure accurately a quantity of the resulting solution, dilute with the mobile phase to produce a solution of 5 µg per ml as reference solution. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% to 15% full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than 1/2 area of the principal peak in the chromatogram obtained with the reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 9.9 EU per mg of ondansetron.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity of the injection, dilute with mobile phase to produce a solution of 80 µg per ml, complete the assay as described under Ondansetron Hydrochloride, and multiply the result by 0.8895.

Category As described under Ondansetron Hydrochloride.

Strength calculated as $C_{18}H_{19}N_3O$
(1) 2 ml:4 mg (2) 4 ml:8 mg

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Ondansetron Hydrochloride Tablets

Ondansetron Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ondansetron ($C_{18}H_{19}N_3O$).

Description White or almost white tablets or film coated tablets with white or almost white core.

Identification (1) The retention time of principal peak of ondansetron hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ondansetron hydrochloride CRS in the chromatogram of the reference solution correspondingly.

(2) The light absorption of the test solution obtained in Content uniformity exhibits maxima at 248 nm, 267 nm and 310 nm, and minima at 282 nm and 257 nm (Appendix IV A).

(3) Shake a quantity of powdered tablets with a quantity of water to dissolve ondansetron hydrochloride, filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Assay except the detection wavelength is 216 nm. Transfer a quantity of powdered tablets, equivalent to about 4 mg of ondansetron, to a 10 ml volumetric flask, dissolve ondansetron hydrochloride and dilute with mobile phase to volume, filter, take the successive filtrate as test solution. Measure accurately a quantity of the resulting solution, dilute with mobile phase to produce a solution of 4 µg per ml as reference solution. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% to 15% full scale of the chart. Inject separately 10 µl each of the test solution and the reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution, shake to dissolve ondansetron hydrochloride, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, filter. Transfer 10 ml of the successive filtrate to 50 ml volumetric flask (for strength 4 mg) or 100 ml volumetric flask (for strength 8 mg), dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well, take it as test solution. Dissolve an accurately weighed quantity of ondansetron hydrochloride CRS in 0.1 mol/L hydrochloric acid solution, to produce a solution of 8 µg per ml as reference solution. Measure the absorbance of the resulting solutions at 310 nm (Appendix IV A), calculate the content of $C_{18}H_{19}N_3O$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml (for strength 4 mg) or 1000 ml (for strength 8 mg) of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution at 30 minutes and filter, take the successive filtrate as test solution. Dissolve ondansetron hydrochloride CRS in 0.1 mol/L hydrochloric acid solution, to produce a solution of 8 µg per ml as reference solution. Measure the absorbance of the resulting solutions at 310 nm (Appendix IV A), calculate the dissolution of $C_{18}H_{19}N_3O$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 8 mg of ondansetron, dissolve in mobile phase to produce a solution of 80 µg per ml, and filter. Measure accurately a quantity of the successive filtrate, complete the Assay as described under Ondansetron hydrochloride, and multiply the result by 0.8895.

Category As described under Ondansetron Hydrochloride.

Strength calculated as $C_{18}H_{19}N_3O$
(1) 4 mg (2) 8 mg

Storage Preserve in tightly closed containers, stored in a cool and dry place, protected from light.

Opium

Opium is the dried latex obtained by incision from the unripe capsules of *Papaver somniferum* L. It contains not less than 10.0% of anhydrous morphine

($C_{17}H_{19}NO_3$).

Description A brown or dark brown pasty mass. Fresh mass is slightly soft and becomes hard or brittle on storage. Odour, characteristic; taste, very bitter.

Identification (1) Heat and macerate about 0.1 g in 5 ml of water, filter. To the filtrate add a few drops of ferric chloride TS, a purple red colour is produced; the colour is not changed on the addition of a few drops of dilute hydrochloric acid or mercuric chloride TS.

(2) Shake about 0.1 g with 5 ml of chloroform and a few drops of ammonia TS for 10 minutes. Transfer the chloroform layer to a watch glass and evaporate to dryness on a water bath, the residue is greyish white crystals and a deep red colour is produced on the addition of 2 drops of formaldehyde-sulfuric acid TS.

(3) Triturate 0.2 g with 5 ml of water and 5 ml of ammonia TS, add 20 ml of chloroform-ethanol (1:1) solution, shake gently in a separator and allow it to stand. Evaporate the extract to dryness on a water bath, dissolve the residue in 1 ml of chloroform-ethanol (1:1) solution as test solution. Prepare reference solutions of morphine CRS, codeine phosphate CRS, papaverine hydrochloride CRS, noscapine CRS and thebaine CRS 1 mg each per ml of a mixture of chloroform-ethanol (1:1), respectively. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-acetone-methanol-concentrated ammonia TS (8:4:0.6:0.25) as the mobile phase. Apply separately to the same plate 10 μ l each of above six solutions. After developing and removal of the plate, dry it in air, spray with potassium iodobismuthate TS. There are not less than seven spots in the chromatogram obtained with test solution, colour and position of the five spots among them obtained with the test solution correspond to the principal spots obtained with the five reference solutions respectively.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution — 0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (5:5:2) as the mobile phase. Detection wavelength is 220 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

Carry out the treatment and elution described under the procedure, using a column packed with octadecylsilane bonded silica gel. Measure accurately 0.5 ml of morphine CRS solution of 0.5 mg per ml, into treated column, elute with 5% acetic acid solution containing 20% of methanol. Collect the eluate with 5 ml volumetric flask to the volume, mix well. Inject 10 μ l of the eluate and the reference solution under Assay, accurately measured, respectively, record the chromatogram. The ratio of the morphine peak area of the eluate to that of the reference solution is 0.97-1.03.

Procedure A column packed with octadecylsilane bonded silica gel is filled with a mixture of methanol-water (3:1). Wash it using 15 ml of the mixture and 5 ml of water one after the other for one time each. Rinse with ammonia solution (to a quantity of water add ammonia TS to pH of 9) (pH \approx 9) until the pH value of the outflow is about 9. Triturate about 5 g of the substance being examined and let it through No. 5 sieve. Transfer about 1 g, accurately weighed, into a 200 ml volumetric flask, add a quantity of 5% acetic acid solution, dissolve by ultrasonic generator, for 30 minutes, cool to room temperature, dilute to volume with 5% acetic acid solution, mix well and filter. Accurately measure 0.5 ml of successive filtrate to the above column, add a few drops of ammonia TS, (measure the same volume of successive filtrate to adjust previously, and

examine the quantity of ammonia TS) mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution containing 20% of methanol. Collect the eluate with 5 ml volumetric flask to the volume and mix well. Inject 10 μ l of the eluate into the column.

Dissolve a quantity of morphine CRS, accurately measured, in 5% acetic acid solution containing 20% of methanol and dilute to produce reference solution of 0.05 mg per ml, repeat the operation. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Analgesic, Antidiarrheal.

Storage Preserve in tightly closed containers.

Opium Tablets

Opium Tablets are prepared by powdered opium. It contains not less than 4.5 mg and not more than 5.5 mg of morphine in each tablet, calculated with reference to anhydrous morphine ($C_{17}H_{19}NO_3$).

Formula	Powdered Opium	50 g
	Excipient	a quantity
	To make	1000 tablets

Description Pale brown tablets.

Identification (1) To a quantity of powdered tablets equivalent to 0.1 g of powdered opium add 5 ml of water, rinse while heating and filter. To the filtrate add a few drops of ferric chloride TS, a purple colour is produced; the colour has no change when adding a few drops of dilute hydrochloric acid or mercuric chloride TS.

(2) Triturate a quantity of powdered tablets equivalent to 0.2 g of Powdered Opium with 5 ml of water and 5 ml of ammonia TS, transfer to a separator, add 20 ml of chloroform-ethanol (1:1) solution, shake gently and allow it to stand. Evaporate the extract to dryness on a water bath, dissolve the residue in 1 ml of chloroform-ethanol (1:1) solution as the test solution. Weigh separately a quantity of morphine CRS, codeine phosphate CRS, papaverine hydrochloride CRS, noscapine CRS and thebaine CRS in a mixture of chloroform-ethanol (1:1) to produce a solution containing 1 mg per ml respectively. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-acetone-methanol-concentrated ammonia solution (8:4:0.6:0.25) as the mobile phase. Apply separately to the plate 10 μ l of each of the above six solutions. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. There are not less than seven spots in the chromatogram obtained with the test solution, colour and position of the five spots among them obtained with the test solution correspond to the principal spots obtained with the five reference solutions.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution — 0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (2:2:1) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test of solid phase extraction column

Using a solid phase extraction column packed with octadecylsilane bonded silica gel. Carry out the test as described under the Procedure. Measure accurately 1 ml of a solution in 5% acetic acid solution containing 0.03 mg of morphine CRS per ml to the column pretreated. Collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate and the reference solution as described under the Procedure into the column, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak area of morphine obtained in the chromatogram of the eluate to the reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3:1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH about 9 (add drops of ammonia TS to a quantity of water until the pH value is about 9) until the pH value of the eluate is about 9. Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powdered tablets equivalent to about 1.5 mg of morphine into a conical flask with stopper, add accurately 10 ml of 5% acetic acid solution, sonicate for 20 minutes to dissolve morphine, cool and filter. Measure accurately 1 ml of the successive filtrate to the above washed column, drop a quantity of ammonia TS to adjust pH value of the solution in the column to about 9 (define the quantity of ammonia TS by using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water to make the drips neutral after no solvent drips. Elute with 5% acetic acid solution, collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate into the column, record the chromatogram. Repeat the operation, using a solution in 5% acetic acid solution of 0.03 mg of morphine CRS per ml instead of the eluate. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Category As described under Opium.

Storage Preserve in tightly closed containers, protected from light.

Opium Tincture

Opium Tincture contains not less than 0.95% and not more than 1.05% of morphine, calculated as anhydrous morphine ($C_{17}H_{19}NO_3$).

Description A brown liquid; foams on shaking with water.

Identification Evaporate a quantity to dryness on a water bath, the residue complies with the tests for Identification described under Opium.

Ethanol content 41%-46% (Appendix VII E).

Other requirements Comply with the general requirements for tincture (Appendix I C).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution — 0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (5:5:2) as the mobile phase. Detection wavelength is 220 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

Carry out the treatment and elution described under the

bonded silica gel. Measure accurately 0.5 ml of morphine CRS solution of 0.5 mg per ml, into treated column, elute with 5% acetic acid solution containing 20% of methanol. Collect the eluate with 5 ml volumetric flask to the volume, mix well. Inject 10 μ l of the eluate and the reference solution under Assay, accurately measured, respectively, record the chromatogram. The ratio of the morphine peak area of the eluate to that of the reference solution is 0.97-1.03.

Procedure A column packed with octadecylsilane bonded silica gel is filled with a mixture of methanol-water (3:1). Wash it using 15 ml of the mixture and 5 ml of water one after the other for one time each. Rinse with ammonia solution (to a quantity of water add ammonia TS to pH of 9) ($pH \approx 9$) until the pH value of the outflow is about 9. Triturate about 5 g of the substance being examined and let it through No. 5 sieve. Transfer about 1 g, accurately weighed, into a 200 ml volumetric flask, add a quantity of 5% acetic acid solution, dissolve by ultrasonic generator, for 30 minutes, cool to room temperature, dilute to volume with 5% acetic acid solution, mix well and filter. Accurately measure 0.5 ml of successive filtrate to the above column, add a few drops of ammonia TS (measure the same volume of successive filtrate to adjust previously and examine the quantity of ammonia TS) mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution containing 20% of methanol. Collect the eluate with 5 ml volumetric flask to the volume and mix well. Inject 10 μ l of the eluate into the column.

Dissolve a quantity of morphine CRS, accurately measured, in 5% acetic acid solution containing 20% of methanol and dilute to produce reference solution of 0.05 mg per ml, repeat the operation. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Powdered Opium.

Storage Preserve in tightly closed containers and stored at a temperature below 30°C.

Powdered Opium

Powdered Opium is opium dried at a temperature below 70°C, reduced to fine powder and prepared by the addition of lactose or other diluents after determining the content of morphine. It contains not less than 9.5% and not more than 10.5% of morphine, calculated with reference to anhydrous morphine ($C_{17}H_{19}NO_3$).

Description A light brown to yellowish-brown powder; odour, characteristic; taste, very bitter.

Identification Comply with the tests for Identification described under Opium.

Assay Carry out the assay described under Opium using a quantity of the powder.

Category As described under Opium.

Storage Preserve in tightly closed containers.

Preparation (1) Opium Tablets (2) Opium Tincture
(3) Compound Platycodon Tablets
(4) Compound Liquorice Tablets

Oral Rehydration Salts I

Oral Rehydration Salts I contains 1.575-1.925 g of sodium chloride (NaCl), 0.675-0.825 g of potassium chloride (KCl), 1.125-1.375 g of sodium bicarbonate and 9.90-12.10 g of glucose ($C_6H_{12}O_6 \cdot H_2O$), in each package.

Formula	Sodium chloride	1750 g
	Sodium Bicarbonate	1250 g
	Potassium Chloride	750 g
	Glucose	11000 g

to make 1000 packages

Preparation Triturate glucose and sodium chloride to fine powder, mix well, pack in bulk; triturate potassium chloride and sodium bicarbonate to fine powder, mix well, divide into small package; pack the bulk and small packages together in a container

Description A white crystalline powder.

Identification *Large bag* (1) Comply with the test (1) for Identification described under glucose.
(2) An aqueous solution yields the reactions characteristic of sodium salts and chlorides (Appendix III).

Small bag An aqueous solution yields the reactions characteristic of potassium salts, sodium salts, chlorides and bicarbonates (Appendix III).

Weight variation of contents Take 10 packages, weigh separately the contents of each large bag and small bag in each container. The difference between each bag and the labelled amount; large bag should be not more than $\pm 5\%$ and small bag should be not more than $\pm 7\%$. Not more than 2 bags exceeding the weight variation limit and none exceeding the double amount of weight variation limit.

Assay *Sodium chloride* Dissolve about 0.7 g of the contents of large bag, accurately weighed, in 50 ml of water, add 5 ml of 2% dextrin solution, about 0.1 g of calcium carbonate and 5 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of NaCl.

Potassium chloride Dissolve about 0.4 g of the contents of small bag, accurately weighed, in 50 ml of water, add 1 drop of phenolphthalein IS, add a quantity of dilute sulfuric acid to discharge the red colour, add 5 ml of 2% dextrin solution, about 0.1 g of calcium carbonate and 5 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) is equivalent to 7.455 mg of KCl.

Sodium bicarbonate Dissolve about 0.24 g of the contents of small bag, accurately weighed, in 50 ml of water, add 1 drop of methyl orange IS, titrate with sulfuric acid (0.05 mol/L) VS. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 8.401 mg $NaHCO_3$.

Glucose Weigh accurately about 12 g of the contents of large bag in a 100 ml volumetric flask, add 80 ml of water to dissolve, add 0.2 ml of ammonia TS, dilute with water to volume, mix well, allow to stand for 30 minutes, carry out the determination of optical rotation (Appendix VI E). The observed rotation in degree multiplied by 2.0852 represents the weight in g of $C_6H_{12}O_6 \cdot H_2O$.

Category Electrolytes replenisher.

Strength 1.575 g sodium chloride, 0.675 g potassium chloride and 1.125 g sodium bicarbonate in each package.

sodium chloride in large bags; 0.75 g of potassium chloride and 1.25 g of sodium bicarbonate in small bags)

Storage Preserve in tightly closed containers, stored in a dry place.

Oral Rehydration Salts II

Oral Rehydration Salts II contains 0.370-0.452 g of sodium (Na), 0.138-0.173 g of potassium (K), 0.510-0.624 g of total chlorine (Cl); 0.522-0.638 g of sodium citrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) and 3.60-4.40 g of anhydrous glucose ($C_6H_{12}O_6$) in each package (for 5.58 g strength); Oral Rehydration Salts II contains 0.926-1.131 g of sodium (Na), 0.354-0.433 g of potassium (K), 1.276-1.560 g of total chlorine (Cl); 1.305-1.595 g of sodium citrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) and 9.00-11.00 g of anhydrous glucose ($C_6H_{12}O_6$) in each package (for 13.95 g strength); Oral Rehydration Salts II contains 1.852-2.262 g of sodium (Na), 0.708-0.866 g of potassium (K), 2.552-3.120 g of total chlorine (Cl); 2.610-3.190 g of sodium citrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) and 18.00-22.00 g of anhydrous glucose ($C_6H_{12}O_6$) in each package (for 27.9 g strength);

Description A white crystalline powder.

Identification (1) Comply with the test (1) for Identification described under glucose.

(2) Dissolve 1 g in 1 ml of water, add 1 ml of dilute acetic acid, mix well, add 0.5 ml sodium cobaltinitrite TS; a yellow precipitate is produced.

(3) An aqueous solution yields the reactions characteristic of chlorides, sodium salts and citrates (Appendix III).

Alkalinity Dissolve 1.4 g in 50 ml of water, pH 7.0-8.8 (Appendix VI H).

Loss on drying When dried to constant weight at 60°C, loses not more than 2.0% of its weight (Appendix VIII L).

Weight variation of contents Take 10 packages, weigh accurately the contents in each of them. The difference of each weight with the labelled amount is not more than $\pm 5\%$ (for 5.58 g strength) or $\pm 3\%$ (for 13.95 g and 27.9 g strength). Not more than 2 packages exceeding the weight variation limit, and none exceeding the double weight variation limit.

Assay *Total sodium* Reference solution; Dissolve about 1.0 g weighed accurately, previously dried to constant weight at 110°C, of sodium chloride (AR), in water in a 200 ml volumetric flask, dilute to volume and mix well. Measure accurately 5 ml to a 100 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 1, 2 and 3 ml to three 100 ml volumetric flasks separately, then add 2, 4 and 6 ml of 10% strontium chloride solution accordingly, dilute with water to volume and mix well.

Test solution; Dissolve about 13 g with water in a 250 ml volumetric flask, dilute with water to volume, mix well, as solution (1). Measure accurately 5 ml to a 100 ml volumetric flask, dilute with water to volume, mix well; then measure accurately 1 ml to a 100 ml volumetric flask, add 4 ml of 10% strontium chloride solution, dilute with water to volume and mix well.

Procedure Carry out the method for atomic absorption

spectrophotometry (Appendix IV D assay, method 1), measure the absorbances at 589.0 nm of the test solution and the reference solution. Calculate the content of total sodium (Na).

Potassium R : D v t l g, previously dried at 130°C to constant weight, of potassium chloride (AR), accurately weighed, in water in a 200 ml volumetric flask and dilute to volume, mix well. Measure accurately 5 ml to a 100 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 1, 2 and 3 l fl s p ly, h , 6 and 9 ml of 10% strontium chloride solution accordingly, dilute with water to volume, mix well.

Test solution: Measure accurately 5 ml of the solution (1) obtained in the test for total sodium to a 50 ml volumetric flask, dilute with water to volume, mix well. Then measure accurately 2 ml to a 100 ml volumetric flask, add 6 ml of 10% strontium chloride solution, dilute with water to volume and mix well.

Procedure: Carry out the method for atomic adsorption spectrophotometry (Appendix IV D assay method 1), measure the absorbances of the two solutions at 766.5 nm. Calculate the content of potassium (K).

Total chlorine Dissolve about 2.8 g, accurately weighed in a 100 ml volumetric flask, with water and dilute to volume. Measure accurately 10 ml, add 3-5 drops of potassium chromate IS, titrate with silver nitrate (0.1 mol/L) VS slowly to the end point. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of total chlorine (Cl).

Sodium citrate Weigh accurately about 2.8 g into a 100 ml volumetric flask, add 80 ml glacial acetic acid, shake well, heat at 50°C, cool to room temperature, dilute with glacial acetic acid to volume and mix well. Allow to stand, measure accurately 20 ml of the supernatant liquid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the solution turns blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 9.803 mg of $C_6H_5Na_3O_7 \cdot 2H_2O$.

Anhydrous glucose Dissolve about 13 g, accurately weighed, in a 100 ml volumetric flask with 80 ml of water, add 0.2 ml of ammonia TS, dilute with water to volume and mix well. Allow to stand for 30 minutes, carry out the determination of optical rotation (Appendix IV E). The observed rotation in degree multiplied by 1.8954 represents the weight in g of $C_6H_{12}O_6$.

Category Electrolyte replenisher.

- (1) 5.58 g per package (0.7 g of sodium chloride, 0.3 g of potassium chloride, 0.58 g of sodium citrate, 4 g of anhydrous glucose. Dissolve with 500 ml of water before use.)
 - (2) 13.95 g per package (1.75 g of sodium chloride, 0.75 g of potassium chloride, 1.45 g of sodium citrate, 10 g of anhydrous glucose. Dissolve with 1000 ml of water before use.)
 - (3) 27.9 g per package (3.5 g of sodium chloride, 1.5 g of potassium chloride, 2.9 g of sodium citrate, 20 g of anhydrous glucose. Dissolve with 2000 ml of water before use.)

Storage Preserve in tightly closed containers, stored in a dry place.

Oxacillin Sodium

$C_{19}H_{18}N_3NaO_5S \cdot H_2O$ 441.44

[7240-38-2]

Oxacillin Sodium is Sodium (2S, 5R, 6R)-3,3-dimethyl-6-(5-methyl-3-phenyl-4-isoxazolecarboxamido)-7-oxo-4-thia-1-azabicyclo[3.2.0]-heptane-2-carboxylate monohydrate. It contains not less than 90.0% of $C_{19}H_{18}N_3NaO_5S$, Calculated on the anhydrous basis.

Description A white powder or crystalline powder; odourless or odour slightly.

Freely soluble in water; very slightly soluble in acetone, or butanol; practically insoluble in ethyl acetate, or petroleum ether.

Specific optical rotation +195° to +214°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of oxacillin sodium CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum is concordant with the spectrum of oxacillin sodium CRS.

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 20 mg per ml, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Related substances Dissolve an accurately weighed quantity in water to produce a test solution of 1 mg per ml. Dilute an accurately measured quantity with water to produce a reference solution of 0.01 mg per ml. Carry out the method described under Assay, inject 10 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject 10 μ l of the test solution and the reference solution respectively, and record the chromatogram for 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1.0%); the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (5.0%).

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.1 EU per ml. (for parenteral use).

Carry out the test for sterility (Appendix XI

H. membrane filtration method), dissolving a quantity in the suitable solvent and transferring the solution to not less than 500 ml of 0.9% sterile sodium chloride solution for parenteral use.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with phenylsilane bonded silica gel and a mixture of 0.02 mol/L potassium dihydrogen phosphate solution (adjust the pH with phosphoric acid to 3.6) -acetonitrile-methanol(700:225:75) as the mobile phase. Detection wavelength is 225 nm. Inject 10 μ l of the reference solution of oxacillin sodium CRS into the column and record the chromatogram. The number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of oxacillin. The tailing factor is not more than 1.8.

procedure Dissolve an accurately weighed quantity of oxacillin sodium in water to produce a solution of 0.1 mg per ml. Inject 10 μ l of the solution into the column and record the chromatogram. Repeat the operation, using oxacillin sodium CRS. Calculate the content of $C_{19}H_{19}N_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -Lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Oxacillin sodium for Injection

Oxacillin Sodium for Injection

Oxacillin Sodium for Injection is a sterile powder of Oxacillin Sodium. It contains not less than 90.0% of oxacillin ($C_{19}H_{19}N_3O_5S$), calculated on the anhydrous basis. It contains not less than 95.0% and not more than 105.0% of the labelled amount of oxacillin ($C_{19}H_{19}N_3O_5S$), calculated on the basis of the average weight of contents.

Description A white, crystalline or amorphous powder.

Identification Comply with the tests for Identification described under Oxacillin Sodium.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Related substances Carry out the Assay described under Oxacillin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than 2 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0%); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5.0%).

Water Not more than 5.5% (Appendix VIII M, method 1 A).

Acidity, Bacterial endotoxin and sterility Complies with the corresponding tests described under Oxacillin Sodium.

Other requirements Comply with the general requirements for injections (Appendix I B), except the weight variation

of content is not more than $\pm 7.0\%$.

Assay Carry out the Assay described under Oxacillin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Oxacillin Sodium.

Strength calculated as $C_{19}H_{19}N_3O_5S$
(1) 0.5 g (2) 1 g

Storage Preserve in well closed containers, stored in a dry place.

Oxaprozin

$C_{18}H_{15}NO_3$ 293.32

[21256-18-8]

Oxaprozin is (4,5-diphenyloxazol-2-yl) propionic acid. It contains not less than 98.5% of $C_{18}H_{15}NO_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or with a slight characteristic odour; taste, slightly bitter.

Freely soluble in dimethylformamide or dioxane; soluble in chloroform or glacial acetic acid; sparingly soluble in dehydrated ethanol; slightly soluble in ether or benzene; practically insoluble in water.

Melting range 161-165°C (Appendix VI C).

Identification (1) The light absorption of a solution of 20 μ g per ml in ethanol exhibits two maxima at 286 nm and 222 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of oxaprozin CRS (Appendix XVI).

Acidity Dissolve 1 g in 20 ml of water and shake thoroughly, heat to boiling, cool to room temperature and filter. To the filtrate add 1 drop of phenolphthalein IS, titrate with sodium hydroxide (0.01 mol/L) VS; not more than 0.5 ml of sodium hydroxide (0.01 mol/L) VS is required.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (adjust with phosphoric acid to pH of 2.5) (50:50) as the mobile phase. Detection wavelength is 254 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak oxaprozin. Dissolve a quantity in acetonitrile to produce a solution of 2.0 mg per ml as the test solution. Measure accurately a quantity of the test solution and dilute with acetonitrile to produce the reference solution of 20 μ g per ml. Inject 20 μ l of the reference solution into the column adjust the attenuation so that the principal peak height in the chromatogram is 10%-30% of the full scale of the chart. Inject separately 20 μ l each of the test and reference solution, both accurately measured, into the column and record the chromatogram for 5 times the retention time of the principal peak. The sum of peak areas due to impurities is not greater

than the principal peak area of the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay To 0.3 g, accurately weighed, add 25 ml dehydrated ethanol (neutral to phenolphthalein), shake to dissolve. Add 2 drops of phenolphthalein IS and titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 29.33 mg of $C_{18}H_{15}NO_3$.

Category Antipyretic and analgesic non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Oxaprozin Enteric-coated Capsules
(2) Oxaprozin Enteric-coated Tablets

Oxaprozin Enteric-coated Capsules

Oxaprozin Enteric-coated Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of oxaprozin ($C_{18}H_{15}NO_3$).

Description Capsules containing white or almost white powder or granules.

Identification (1) Powder finely the content of the capsules and dissolve a quantity of the powder equivalent to about 0.1 g of oxaprozin in 20 ml of ethanol on a water bath, filter and evaporate the filtrate on a water bath to dryness, dissolve about 20 mg of the residue in warm dilute sulfuric acid, add dropwise potassium iodobismuthate TS, an orangere precipitate is produced.

(2) Protect from light throughout the procedure. Dissolve a quantity of the content equivalent to about 0.1 g of oxaprozin in 8 ml of methanol by shaking and filter, transfer the filtrate to a 10 ml volumetric flask and dilute to volume with methanol, mix well and use this solution as test solution. Prepare reference solution of 10 mg of oxaprozin CRS per ml in methanol. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF254 as the coating substance and a mixture of chloroform-glacial acetic acid (40:0.5) as the mobile phase. Apply separately to the plate 5 μ l of each of above two solutions. After developing and removal of the plate, dry it in air, and examine under ultra-violet light (254 nm). The position and colour of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The light absorption of the solution obtained in the Assay exhibits two maxima at 222 nm and 286 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Dissolve a quantity of the content of the capsules in a quantity of acetonitrile to produce a solution of 2 mg per ml, filter and use the successive filtrate as solution 1; Measure accurately 1 ml into a 100 ml volumetric flask, dilute to volume with mobile phase, mix well as solution 2. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed

(adjust pH to 2.5 with phosphoric acid) -acetonitrile (50:50) as the mobile phase. The detection wavelength is 254 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of oxaprozin. Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in chromatogram is between 10% and 30% of the full scale of the chart. And then inject separately 20 μ l of each of solution (1) and (2) into the column, and record the chromatogram for 5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) are not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2).

Drug Release Protect from light throughout the procedure. Carry out the Drug Release Test [(Appendix X D, method 2 (2)), using the apparatus of the dissolution test method II and 1000 ml of hydrochloric acid solution (9→1000) as the release medium initially, adjust the rotational speed of the paddle to 100 rpm. Any enteric-coated capsule shows no cracking or disintegrating at 2 hours. Then use 1000 ml of phosphate BS (pH 6.8) as the release medium, use the same rotational speed, continue to operate the apparatus, withdraw a quantity of the solution at 45 minutes and filter. Dilute 5 ml of successive filtrate, accurately measured, with above buffer to 100 ml and mix well.

Dissolve a quantity of oxaprozin CRS, accurately weighed, in phosphate BS (pH 6.8) to produce a solution containing 10 μ g per ml. Measure the absorbances of the resulting solutions at 285 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{15}NO_3$ from each capsule. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. Transfer a quantity of the content of the capsules equivalent to about 50 mg of oxaprozin, accurately weighed, to a 100 ml volumetric flask, add a quantity of ethanol, shake thoroughly to dissolve oxaprozin and dilute to volume with ethanol, mix well and filter, dilute 2 ml of successive filtrate, accurately measured, with ethanol to 100 ml and mix well. Dissolve a quantity of oxaprozin CRS, accurately weighed, in ethanol to produce a solution containing about 10 μ g per ml. Measure the absorbances of the resulting solutions at 286 nm (Appendix IV A), calculate the content of $C_{18}H_{15}NO_3$.

Category As described under Oxaprozin.

Strength 0.2 g

Storage Preserve in tightly closed containers and protected from light.

Oxaprozin Enteric-coated Tablets

Oxaprozin Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of oxaprozin ($C_{18}H_{15}NO_3$).

Description Enteric coated tablets with white or almost white core.

Identification (1) Powder finely the tablets with coating removed and dissolve a quantity of the powder equivalent to about 0.1 g of oxaprozin in 20 ml of ethanol on a water bath, filter and evaporate the filtrate on a water bath to dryness, dissolve about 20 mg of the residue in warm dilute sulfuric acid, add dropwise potassium iodobismuthate TS and an

orange-red precipitate is produced.

(2) Protect from light throughout the procedure. Dissolve a quantity of the powder equivalent to about 0.1 g of oxaprozin in 8 ml of methanol by shaking and filter, transfer the filtrate to a 10 ml volumetric flask and dilute to volume with methanol, mix well and use this solution as a test solution. Prepare a reference solution of 10 mg of oxaprozin CRS per ml in methanol. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF254 as the coating substance and a mixture of chloroform-glacial acetic acid (40:0.5) as the mobile phase. Apply separately to the plate 5 μ l of each of above two solutions. After developing and removal of the plate, dry it in air, and examine under ultra-violet light (254 nm). The position and colour of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The light absorption of the solution obtained in the Assay exhibits two maxima at 222 nm and 286 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Dissolve a quantity of the powdered tablets obtained in Assay in a quantity of acetonitrile to produce a solution of 2 mg per ml, filter and use the filtrate as solution 1; Measure accurately 1 ml into a 100 ml volumetric flask, dilute to volume with mobile phase, mix well as solution 2. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water (adjust pH to 2.5 with phosphoric acid) -acetonitrile (50:50) as the mobile phase. The detection wavelength is 254 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of oxaprozin.

Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in chromatogram is between 10% and 30% of the full scale of the chart. And then inject separately 20 μ l of each of solution (1) and (2) into the column, and record the chromatogram for 5 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) are not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2).

Drug Release Protect from light throughout the procedure. Carry out the Drug Release Test [Appendix X D, method 2 (2)], using the apparatus of the dissolution test method I and 1000 ml of hydrochloric acid solution (9 \rightarrow 1000) as the release medium initially, adjust the rotational speed of the basket to 100 rpm. Any enteric-coated tablet shows no cracking or disintegrating at 2 hours. Then use 1000 ml of phosphate BS (pH 6.8) as the release medium, use the same rotational speed, continue to operate the apparatus, withdraw a quantity of the solution at 45 minutes and filter. Dilute 5 ml of successive filtrate, accurately measured, with above buffer to 100 ml and mix well.

Dissolve a quantity of oxaprozin CRS, accurately weighed, in phosphate BS (pH 6.8) to produce a solution containing 10 μ g per ml. Measure the absorbances of the resulting solutions at 285 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{15}NO_3$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder finely 10 tablets with enteric coating removed. Transfer a quantity of the powder equivalent to about 50 mg of oxaprozin, accurately weighed, to a 100 ml

volumetric flask, add a quantity of ethanol, shake thoroughly to dissolve oxaprozin and dilute to volume with ethanol, mix well and filter, dilute 2 ml of successive filtrate, accurately measured, with ethanol to 100 ml and mix well. Dissolve a quantity of oxaprozin CRS, accurately weighed, in ethanol to produce a solution containing about 10 μ g per ml. Measure the absorbances of the resulting solutions at 286 nm (Appendix IV A), calculate the content of $C_{18}H_{15}NO_3$.

Category As described under Oxaprozin.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Oxazepam

$C_{15}H_{11}ClN_2O_2$ 286.72

[604-75-1]

Oxazepam is (\pm)-7-chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one. It contains not less than 98.0% and not more than 102.0% of $C_{15}H_{11}ClN_2O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless.

Slightly soluble in ethanol, chloroform or acetone; very slightly soluble in ether; practically insoluble in water.

Melting range 198-202°C, with decomposition (Appendix VI C).

Identification (1) To about 10 mg add 15 ml of hydrochloric acid solution (1 \rightarrow 2), heat gently to boiling and cool in an ice bath. Add 4 ml of sodium nitrite TS, dilute with water to produce 20 ml and allow to stand for 10 minutes in an ice bath. Add alkaline β -naphthol TS dropwise, an orange red precipitate is produced, which darkens on standing.

(2) The light absorption of a solution of 10 μ g per ml in ethanol exhibits two maxima at 229 nm and 315 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of oxazepam (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of chloroform-methanol (100:10) as the mobile phase. Apply separately to the plate 20 μ l of each of the following solutions in acetone containing (1) 5 mg per ml, (2) 10 μ g per ml, (3) 5 μ g per ml of the substance being examined. After developing and removal of the plate, dry it in air, examine under ultra-violet light (254 nm). Any spot, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2); not more than one secondary spots are more intense than the principal spot in the chromatogram obtained with solution (3).

Acidity To 1.0 g add 50 ml of water to produce a

suspension; pH 5.0-7.0 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Weigh accurately about 15 mg to a 200 ml volumetric flask, add 150 ml of ethanol, warm on a water bath with frequent shaking to dissolve oxazepam, cool, dilute with ethanol to volume, mix well. Measure accurately 5 ml of the solution to a 100 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance of the resulting solution at 229 nm (Appendix IV A). Repeat the operation using oxazepam CRS instead of the substance being examined, calculate the content of $C_{15}H_{11}ClN_2O_2$.

Category Anxiolytic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Oxazepam Tablets

Oxazepam Tablets

Oxazepam Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of oxazepam ($C_{15}H_{11}ClN_2O_2$).

Description White tablets.

Identification (1) Place a quantity of the powdered tablets equivalent to about 15 mg of oxazepam in a separator, add 2 ml of water, shake with 15 ml of chloroform, evaporate the chloroform extract to dryness on a water bath. The residue complies with test (1) for Identification described under Oxazepam.

(2) The light absorption of the solution obtained in Assay exhibits two maxima at 229 nm and 315 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution at 60 minutes and filter, use the successive filtrate as the test solution. Weigh accurately about 15 mg of oxazepam CRS to a 100 ml volumetric flask, add 10 ml of ethanol to dissolve oxazepam, dilute with dissolution medium to volume, mix well. Measure accurately 5 ml of the solution to a 50 ml volumetric flask, dilute with dissolution medium to volume, mix well, use it as the reference solution. Measure the absorbance of the resulting solutions at 283 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{11}ClN_2O_2$ from each tablet; not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 15 mg of oxazepam, to a 200 ml volumetric flask. Add 150 ml of ethanol and warm on a water bath with frequent shaking to dissolve oxazepam, cool, dilute with ethanol to volume and mix well. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance at 229 nm (Appendix IV A), calculate the content of $C_{15}H_{11}ClN_2O_2$, taking 1252 as the value of A

Category As described under Oxazepam.

Strength 15 mg

Storage Preserve in tightly closed containers, protected from light.

Oxprenolol

$C_{15}H_{23}NO_3$ 265.21

[6452-71-7]

Oxprenolol is 1-[2-[(2-propenyl)oxy]phenoxy]-3-isopropylamino-2-propanol. It contains not less than 98.5% of $C_{15}H_{23}NO_3$, calculated on the dried basis.

Description A white crystalline powder; taste, bitter.

Freely soluble in ethanol or acetone; sparingly soluble in ether or chloroform; slightly soluble in water.

Identification (1) Dissolve 0.1 g in 2 ml of ethanol, add 1 ml of 0.1 mol/L potassium permanganate solution dropwise, shake for several minutes; the colour of potassium permanganate disappears, and a brown precipitate is produced.

(2) The light absorption of a solution of 40.0 µg per ml in ethanol exhibits a maximum at 275 nm (Appendix IV A).

Melting point 77°C to 80°C (Appendix VI C)

Loss on drying When dried in vacuum over phosphorous pentoxide for 24 hours, loses not more than 1.0% of its weight (Appendix VIII C).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution turns to blue green. Perform a blank determination and make any necessary connection. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.52 mg of $C_{15}H_{23}NO_3$.

Category β-Adrenergic blocker.

Storage Preserve in tightly closed containers, protected from light.

Preparation Oxprenolol Tablets

Oxprenolol Tablets

Oxprenolol Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of oxprenolol ($C_{15}H_{23}NO_3$).

Description White tablets.

Identification (1) To 0.3 g of the powdered tablets add 5 ml ethanol with shaking and filter. To the filtrate, add 1 ml

the colour of potassium permanganate disappears, and a brown precipitate is produced.

(2) The light absorption of the solution of 40 μg of oxprenolol per ml in ethanol exhibits a maximum at 275 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 30 tablets, weigh accurately a quantity equivalent to about 0.2 g of oxprenolol to an iodine flask, add accurately 50 ml of chloroform, extract by shaking and filter. Measure accurately 25 ml of the successive filtrate to a conical flask, add 2 drops of dimethyl yellow IS, titrate with perchloric acid (0.1 mol/L) VS until the colour turns to pink. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) is equivalent to 26.52 mg of $\text{C}_{15}\text{H}_{23}\text{NO}_3$.

Category As described under oxprenolol.

Strength 20 mg

Storage Preserve in tightly closed containers, protected from light.

Oxygen

O_2 32.00

[7782-44-7]

Oxygen contains not less than 99.0% (ml/ml) of O_2 .

Description A colourless gas; odourless; tasteless; with strong combustion-supporting property. Soluble in 7 volumes of ethanol or 32 volumes of water at 20°C under normal atmosphere pressure.

Identification Causes a glowing splinter of wood to burst into flame.

Acidity or alkalinity To 0.3 ml each of methyl red IS and bromothymol blue IS add 400 ml of water, boil for 5 minutes, allow to cool. Transfer 100 ml each of three portions to three Nessler cylinders (A, B and C). Add 0.20 ml of hydrochloric acid (0.01 mol/L) VS to cylinder B and 0.40 ml of hydrochloric acid (0.01 mol/L) VS to cylinder C. Pass 2000 ml of the gas being examined through cylinder B with a flow rate of 4000 ml per hour. Any colour produced in cylinder B is not more intense than the red colour in cylinder C or the green colour in cylinder A.

Carbon monoxide To each of two Nessler cylinders (A and B) add 25 ml of slightly warmed ammoniated silver nitrate TS and pass 1000 ml of the gas being examined through cylinder A with a flow rate of 4000 ml per hour. The solutions in both cylinders are clear and colourless.

Carbon dioxide To each of two Nessler Cylinders A and B add 100 ml of 5% barium hydroxide solution, transfer 1.0 ml of 0.04% sodium hydrogen carbonate solution to cylinder B. Pass 1000 ml of the gas being examined through cylinder A with a flow rate of 4000 ml per hour. Any opalescence produced is not more pronounced than that of cylinder B (0.01%).

Other oxides in gas state To a Nessler Cylinder add 100 ml of freshly prepared potassium iodide-starch solution (dissolve 0.5 g of potassium iodide in 100 ml of starch IS) and 1 drop of acetic acid. Pass 2000 ml of the gas being examined through the cylinder with a flow rate of 4000 ml per hour. The solution is colourless.

Assay Apparatus As shown in the figure. A and C are absorbers with total capacity of about 300 ml; B is a stopper; D, E and I are glass tubes; F is the main body of a gas burette 100 ml in capacity, graduated in divisions of 0.1 ml; G is a three-way tap; H is the gas inlet and outlet and J is a leveling bottle. Connect the absorber to the gas burette with rubber tubing before use. The burette is then connected to the leveling bottle.

Procedure Fill the absorber A with segments of copper wire (wind up a copper wire about 0.8 mm in diameter into a coil about 4 mm in diameter and cut the coil into small segments about 10 mm in length) and tightly seal it with stopper B. Fill A and part of C with ammonia-ammonium chloride solution (add 200 ml of water to 150 g of ammonium chloride and carefully add 200 ml of concentrated ammonia solution with constant stirring and mix well). Introduce a saturated sodium chloride solution into the leveling bottle J and raise the bottle to fill F with the solution, allow excess of solution to flow out of H. Turn G to connect gas burette with the absorber and lower the leveling bottle to fill tubes D, E, I and the inlet of the tap G, close the tap immediately. Eliminate any gas and ammonia-ammonium chloride solution in the gas burette through H by raising the leveling bottle and turning the tap. Attach a reducing valve (specially intend to be used for oxygen) to the metal gas cylinder and connect a rubber tube to the outlet of the valve. Open the cylinder valve slightly with care and then open the reducing valve to let the oxygen spurt out of the cylinder for 1 minute. Adjust the gas flow until it becomes weaker.

Connect the other end of the rubber tube to H and fill the gas burette with the gas being examined. Close G and disconnect the rubber tube from H, allow to stand for a few minutes. Turn G to connect with H and adjust the leveling bottle (keep the solution level slightly lighter than that in the gas burette in order to prevent the inlet of air from outside) so that the liquid level in the gas burette reaches the 100 ml graduation. Turn G to connect gas burette to the absorber and raise the leveling bottle to introduce the gas into absorber A. Close G when the saturated sodium chloride solution flows through tube I and filled up tube D. Shake absorber A carefully and thoroughly for 5-10 minutes. Turn G to connect the gas burette to the absorber when the absorption of gas is nearly completed (residual gas is nitrogen or other nonabsorbable gases). Lower the leveling bottle to transfer the remaining gas into the gas burette. The tap is closed when the ammonia-ammonium chloride solution filled up absorber A and passed through D, E and I.

Adjust the liquid surface of the leveling bottle after about 5 minutes to equilibrate the pressure of the gas in the gas burette with the atmosphere pressure. Read the level of the

liquid meniscus on the graduated part of the burette and calculate the content of O_2 in the gas.

Repeat the above procedure, beginning at the words "Turn G to connect gas burette to the absorber and raise the leveling bottle..." until the volume of the residual gas is constant (the difference between two operations is not more than 0.05 ml) so as to check the completeness of oxygen absorption. Before the checking or determination, keep the metal gas cylinder under room temperature for not less than 6 hours.

Category For the prevention and treatment of oxygen deficiency.

Storage Preserve in a pressure-resistant metal cylinder, stored at a temperature below 36°C .

Oxytetracycline Hydrochloride

$C_{22}H_{24}N_2O_9 \cdot HCl$ 496.90

[2058-46-0]

Oxytetracycline Hydrochloride is 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride. It contains not less than 88.0% of $C_{22}H_{24}N_2O_9$, calculated on the anhydrous basis.

Description A yellow crystalline powder; odourless; taste, slightly bitter; slightly hygroscopic. Darkens on exposure to sunlight and decomposes in alkaline solutions. Freely soluble in water; sparingly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation -188° to -200° , in a solution of 10 mg per ml in hydrochloric acid solution (9 \rightarrow 1000), measured on standing for 1 hour, protected from light (Appendix VI E).

Identification (1) To about 0.5 mg add 2 ml of sulfuric acid; a deep red colour is produced; then add 1 ml of water, the colour changes to yellow.

(2) Carry out the method for thin-layer chromatography (Appendix V B). Apply separately to the plate* 1 μ l each of five solutions in methanol containing (1) 1 mg per ml of the substance being examined, (2) 1 mg per ml of oxytetracycline hydrochloride CRS, (3) 1 mg per ml of chlortetracycline hydrochloride CRS, (4) 1 mg per ml of tetracycline hydrochloride CRS, (5) 1 mg each of oxytetracycline hydrochloride CRS, chlortetracycline hydrochloride CRS and tetracycline hydrochloride CRS per ml. Mix 200 ml of acetone-chloroform-ethyl acetate (1:2:2) with 5 ml of 4% disodium edetate solution (pH 7.0) as the mobile phase. After developing and removal of the plate, dry it in air, expose to the vapour of ammonia and examine under an ultraviolet light (365 nm), three clearly separated spots are obtained with solution (5). The position and intensity of fluorescence of the principal spot in the chromatogram obtained with solution (1) correspond to the principal spot obtained with solution (2).

(3) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the

chromatogram of the reference solution.

(4) The light absorption of a solution of 20 μ g per ml in potassium chloride solution [Dilute 250 ml of 0.2 mol/L potassium chloride solution and 53 ml of 0.2 mol/L hydrochloric acid solution to 1000 ml with water] exhibits a maximum at 353 nm (Appendix IV A), the absorbance is 0.54-0.58.

(5) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

(2) or (3) may be used alternatively.

Acidity A solution of 10 mg per ml in water, pH 2.3-2.9 (Appendix VI H).

Light-absorbing impurities The absorbance of a solution of 2.0 mg per ml in a mixture of 1 volume of hydrochloric acid solution (0.1 mol/L) and 99 volumes of methanol, at 430 nm, measured within 1 hour, is not greater than 0.50; the absorbance of a solution of 10 mg per ml in the same solvent at 490 nm, measured within 1 hour, is not greater than 0.20 (Appendix IV A).

Related substances Dissolve a quantity of the substance being examined, accurately weighted, in a small volume of 0.1 mol/L hydrochloric acid solution, and dilute to 0.15 mg per ml with water, mix well as the test solution. Dissolve a quantity of the substance being examined, accurately weighted, dilute to 3 μ g per ml with 0.01 mol/L hydrochloric acid solution as reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10% of the full scale of the chart. Inject 20 μ l of the test solution and reference solution respectively into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram obtained with the reference solution (2.0%).

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (pH adaptive value is greater than 8), and a mixture of 0.05 mol/L ammonium oxalate solution-dimethylformamide -0.2 mol/L diammonium hydrogen phosphate solution (75:20:5) as the mobile phase. Adjust the pH to 8.0 ± 0.2 with ammonia TS. The flow rate is 0.8 ml per minute. The temperature of the column is 35°C . Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of oxytetracycline. The resolution factor between the peaks of oxytetracycline and adjacent peaks complies the related requirements.

Procedure Dissolve about 25 mg of the substance being examined, accurately weighed, in a 50 ml volumetric flask with 5 ml of 0.1 mol/L hydrochloric acid solution, and dilute to volume with water. Mix well, transfer 10 ml, accurately measured, to a 50 ml volumetric flask, and dilute to volume with 0.1 mol/L hydrochloric acid solution, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using 25 mg of oxytetracycline RS instead of the substance being examined. Calculate the content of $C_{22}H_{24}N_2O_9$ by the external standard method. The flow sequence is oxytetracycline, metacycline and tetracycline, following the peak of the solvent.

Category Tetracycline Antibiotic.

Storage Preserve in tightly closed containers, protected

from light and stored in a dry place.

Preparation Oxytetracycline Hydrochloride Tablets

* Preparation of chromatographic plate Use a mixture of 4% solution of disodium edetate (adjusted to pH 7.0 with concentrated ammonia solution)-glycerol (95:5) as adhesive and slurry a mixture of dried kieselguhr-adhesive (1 g:3 ml) as the coating substance. Spread the plate with a layer of about 0.4 mm, allow it to dry at room temperature and then heat at 105°C for one hour.

Oxytetracycline Hydrochloride Tablets

Oxytetracycline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$).

Description Yellow tablets or sugar coated tablets with yellow core.

Identification Extract a quantity of the powdered tablets equivalent to about 25 mg of oxytetracycline hydrochloride with 25 ml of warm ethanol for 20 minutes, filter and evaporate the filtrate to dryness on a water bath. The residue complies with tests for Identification described under Oxytetracycline Hydrochloride.

Related substances Weigh accurately a quantity of powder obtained in weight variation equivalent to about 30 mg of oxytetracycline, in a 200 ml volumetric flask, add 20 ml of 0.1 mol/L hydrochloric acid solution, dissolve and dilute with water to volume, mix well and filter. Discard the initial filtrate, the successive filtrate is used as the test solution. Transfer accurately 20 ml of successive filtrate, in a 100 ml volumetric flask, and dilute with 0.1 mol/L hydrochloric acid solution to volume as reference solution. Carry out the method as described under Oxytetracycline Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Dissolve a quantity of the mixed contents obtained in weight variation equivalent to 100 mg of Oxytetracycline, accurately weighed, in a 200 ml volumetric flask with 20 ml of 0.1 mol/L hydrochloric acid solution, and dilute to volume with water. Mix well, filter. Transfer 10 ml of the successive filtrate, accurately measured to a 50 ml volumetric flask, and dilute to volume with 0.1 mol/L hydrochloric acid solution, mix well. Carry out the Assay described under Oxytetracycline Hydrochloride.

Category As described under Oxytetracycline Hydrochloride.

Strength Calculated as $C_{22}H_{24}N_2O_9$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Oxytocin Injection

Oxytocin Injection is a sterile solution of Oxytocin in Water for Injection, which is obtained from the posterior lobe of the pituitary of pork or cattle or prepared by synthesis. It contains not less than 91% and not more than 116% of the labelled potency of oxytocin.

Description A colourless, clear or almost clear liquid.

Identification (1) Carry out the biological assay of oxytocin (Appendix XII F), causes contraction of the muscle of the uterus.

(2) Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium dihydrogen phosphate solution (0.1 mol/L)-acetonitrile (82:18) as the mobile phase with a flow rate of 0.8 ml per minute. Detection wavelength is 220 nm. Dilute the substance being examined with 0.9% sodium chloride solution (solution 1) and dissolve the synthetic Oxytocin RS in 0.9% sodium chloride solution (solution 2) to produce the solutions of 5 Units or 10 Units per ml respectively. Inject separately 20 µl of the same concentration of solution (1) and solution (2) into the column. The retention time of the two principal peaks is concordant with each other.

pH value 3.0-4.5 (Appendix VI H).

Vasopressor substances Comply with the test for vasopressor substances (Appendix XI F), using a solution of 2 Units per ml in sterile Sodium Chloride Solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 2.5 EU per unit.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Carry out the biological assay of oxytocin (Appendix XII F), it complies with the requirement for potency.

Category Uterine stimulant.

Strength (1) 0.5 ml : 2.5 Units (2) 1 ml : 5 Units
(3) 1 ml : 10 Units

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Pancreatin

[8049-47-6]

Pancreatin is an enzyme mixture extracted from the pancreases of pig, sheep or cattle. It contains not less than 600 Units of protease, 7000 Units of amylase and 4000 Units of lipase per g, calculated on the dried basis. It may be diluted with lactose, sucrose or pancreatin of lower activity if necessary.

Description An almost white to slightly yellow powder; odour slight but not moldy; hygroscopic. The aqueous solution is inactivated by acids or on boiling.

Fat To 1 g add 10 ml of ether in a stoppered conical flask, allow to stand for about 2 hours with frequent swirling. Filter the solution through an ether-moistened filter paper. Treat the residue with 10 ml of ether as described above and wash with 5 ml of ether. Combine the filtrate and washing in an evaporating dish previously dried to constant weight. Evaporate ether and dry at 105°C for 2 hours. The residue is not more than 20 mg.

Loss on drying When dried at 105°C for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Enzyme activity (1) *Protease Reference solution* Dissolve an accurately weighed quantity of tyrosine CRS, in 0.2 mol/L hydrochloric acid solution to produce a solution of 50 µg per ml.

Test solution Triturate about 0.1 g of the substance being examined, accurately weighed, with a small quantity of cold calcium chloride solution (dissolve 1.47 g of calcium chloride in 500 ml of water, adjust to pH 6.0-6.2 with 0.1 mol/L hydrochloric acid solution or 0.1 mol/L sodium hydroxide solution, cool it below 5°C before use). Pulverize well, and transfer the mixture to a 100 ml volumetric flask, add calcium chloride solution to volume and shake well. Dilute 10 ml of the solution, accurately measured, to 50 ml volumetric flask with borate BS (pH 7.5)* to produce a solution containing about 0.12 Unit of protease per ml.

Procedure To each of 3 test tubes add accurately 1.0 ml of test solution and 2.0 ml of borate BS (pH 7.5), warm in a 40°C water bath for 10 minutes. Add accurately to each tube 5.0 ml of casein solution [add 13 ml of 0.1 mol/L sodium hydroxide solution and 40 ml of water to 1.5 g of casein CRS, heat in a 60°C water bath to dissolve casein and cool, dilute with water to 100 ml and adjust the pH to 8.0 with 0.1 mol/L sodium hydroxide solution or 0.1 mol/L hydrochloric acid solution. Warm in a 40°C water bath before use], mix well. Place the tubes in a 40°C ± 0.5°C water bath for exact 30 minutes. Add to each tube 5.0 ml of 5% trichloroacetic acid, shake well and filter. Discard the initial filtrate and use the successive filtrate for the assay. To another test tube add 1.0 ml of test solution, accurately measured, and 2.0 ml of borate BS (pH 7.5), warm in a 40°C water bath for 10 minutes, add accurately 5 ml of 5% trichloroacetic acid solution and mix well. Allow the reaction to proceed in a 40°C ± 0.5°C water bath for exact 30 minutes. Add immediately 5.0 ml of casein solution, accurately measured, shake well and filter, using the successive filtrate as the blank. Measure the absorbances at 275 nm (Appendix IV A), calculate the average absorbance (A) of the 3 solutions. Measure the absorbance of the reference solution (As) at 275 nm, using 0.2 mol/L hydrochloric acid solution as blank. Calculate the activity of

$$\text{Activity of protease (Unit per g)} = \frac{\bar{A}}{A_s} \times \frac{W_s}{181.19} \times \frac{13}{30} \times \frac{n}{W}$$

Where W_s is Weight of tyrosine per ml in the reference solution (µg);
 W is Weight of the substance being examined (g);
 n is Dilution factor of the substance being examined (500).

Under the above mentioned conditions, the amount of peptides and amino acids produced per minute when casein is hydrolyzed by 1 Unit of protease is equivalent to 1 micromole of tyrosine.

The concentration of the test solution must be altered if the value of \bar{A} is outside the range of 0.15-0.60.

(2) *Amylase Test solution* Triturate an accurately weighed quantity of the substance being examined with a small quantity of cold phosphate BS (pH 6.8)*, add phosphate BS to produce a solution containing 10-20 Units of amylase per ml.

Procedure To 25 ml of 1% potato starch solution (add 10 ml of water to 1.0 g of potato starch, previously dried at 105°C for 2 hours, shake well. Slowly pour the suspension with stirring into 100 ml of boiling water and continue to boil for 20 minutes, cool, add water to produce 100 ml) in a 250 ml glass-stoppered conical flask add 10 ml of phosphate BS (pH 6.8), 1 ml of 1.2% sodium chloride solution and 20 ml of water, warm in a 40°C water bath for 10 minutes, add accurately 1.0 ml of test solution and mix well. Allow the reaction to proceed in a 40°C ± 0.5°C water bath for exact 10 minutes. Add 2 ml of 1 mol/L hydrochloric acid solution and mix well, cool the solution to room temperature. Add accurately 10.0 ml of iodine (0.05 mol/L) VS and add dropwise 45 ml of 0.1 mol/L sodium hydroxide solution with shaking. Allow to stand in the dark for 20 minutes, add 4 ml of 0.1 mol/L sulfuric acid solution (1→4) and titrate with sodium thiosulfate (0.1 mol/L) VS to colourless. To 25 ml of 1% potato starch solution in another glass-stoppered conical flask add 10 ml of phosphate BS (pH 6.8), 1 ml of 1.2% sodium chloride solution and 20 ml of water, warm in a 40°C ± 0.5°C water bath for 10 minutes. Cool to room temperature, add 2 ml of 1 mol/L hydrochloric acid solution and mix well, then add 1.0 ml of test solution and mix well. Add accurately 10.0 ml of iodine (0.05 mol/L) VS and add dropwise 45 ml of 0.1 mol/L sodium hydroxide solution with shaking. Allow to stand in the dark for 20 minutes, add 4 ml of sulfuric acid solution (1→4) and titrate with sodium thiosulfate (0.1 mol/L) VS to colourless (as blank). Each ml of iodine (0.05 mol/L) VS is equivalent to 9.008 mg of anhydrous glucose. Calculate the activity of amylase as follows:

$$\text{Activity of amylase (Unit per g)} = \frac{(B-A) F}{10} \times \frac{9.008 \times 1000}{180.16} \times \frac{n}{W}$$

Where A is Volume of sodium thiosulfate VS consumed in the titration of the substance being examined (ml);
 B is Volume of sodium thiosulfate VS consumed in the titration of the blank (ml);
 F is Concentration factor of the sodium thiosulfate VS, mol/L;
 W is Weight of the substance being examined (g);
 n is Dilution factor of the substance being examined (200).

Under the above mentioned conditions, 1 micromole of glucose is produced per minute when starch is hydrolyzed by 1 Unit of amylase.

The concentration of the test solution must be altered if

(3) **Lipase Test solution** Triturate an accurately weighed quantity of the substance being examined with a small quantity of cold trometamol BS (pH 7.1)^{***}, add the buffer solution to produce a solution containing 8-16 Units of lipase per ml.

Procedure Transfer 25 ml of olive oil emulsion (triturate 4 ml of olive oil with 7.5 g of acacia and gradually add water with constant trituration to produce 100 ml, agitate the mixture in a tissue blender twice at a speed of 8000 rpm, each for 3 minutes. Examine the emulsion under a microscope, 90% of the particles is less than 3 μ m in diameter and none of the particle is above 10 μ m in diameter), 2 ml of 8% taurocholate solution and 10 ml of water to a 100 ml beaker, adjust to pH 9.0 with 0.1 mol/L sodium hydroxide solution. Warm in a 37°C \pm 0.1°C water bath for 10 minutes and adjust to pH 9.0 again, add accurately 1.0 ml of test solution and allow the reaction to proceed in 37°C \pm 0.1°C water bath for exact 10 minutes. Titrate with sodium hydroxide (0.1 mol/L) VS to keep the reaction mixture at pH 9.0, calculate the volume of sodium hydroxide (0.1 mol/L) VS consumed. Boil 1.0 ml of test solution in a water bath for 15-30 minutes and proceed in the same manner as described above as a blank titration. Calculate the activity of lipase as follows:

$$\text{Activity of lipase (Unit per g)} = \frac{(A-B) M \times 1000}{10} \times \frac{n}{W}$$

Where A is Volume of sodium hydroxide VS consumed in the titration of the substance being examined (ml);

B is Volume of sodium hydroxide VS consumed in the titration of the blank (ml);

M is Concentration of sodium hydroxide VS (mol/L);

W is Weight of the substance being examined (g);

n is Dilution factor of the substance being examined (50).

Under the above mentioned conditions, 1 micromole of fatty acids is produced per minute when olive oil is hydrolyzed by 1 Unit of lipase.

The concentration of the test solution must be altered if the average consumption of sodium hydroxide VS (0.1 mol/L) per minute is outside 0.08-0.16 ml.

Category Digestive.

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Preparation (1) Pancreatin Enteric-coated capsules

(2) Pancreatin Enteric-coated Tablets

* Borate BS (pH 7.5): Dissolve 2.85 g of borax, 10.5 g of boric acid and 2.5 g of sodium chloride in water to produce 1000 ml, adjust the pH to 7.5 \pm 0.1. Cool the solution to a temperature below 5°C before use.

** Phosphate BS (pH 6.8): Dissolve 13.61 g of potassium dihydrogen phosphate and 35.80 g of disodium hydrogen phosphate in water to produce 1000 ml, adjust the pH to 6.8. Cool the solution to a temperature below 5°C before use.

*** Trometamol BS (pH 7.1): Dissolve 606 mg of trometamol in 45.7 ml of 0.1 mol/L hydrochloric acid, add water to produce 100 ml, mix well and adjust the pH to 7.1. Cool the solution to a temperature below 5°C before use.

Pancreatin Enteric-coated Capsules

Pancreatin Enteric-coated Capsules contain not less than 540 Units of protease, not less than 6300 Units of amylase and not less than 3400 Units of lipase per g, calculated with reference to the labelled amount of pancreatin.

Description Enteric-coated capsules containing almost white to slightly yellow powder.

Loss on drying When dried at 105°C for 4 hours, loses not more than 7.0% of its weight (Appendix VIII L), using the mixed contents of the capsules.

Microbial limit Comply with the test for microbial limit (Appendix XI J) except that number of bacterial is not more than 10000 and that of fungus is not more than 100 per g.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Activity of enzyme Protease Weigh accurately a quantity of the mixed contents in the test for weight variation of contents equivalent to about 0.45 g of pancreatin to a mortar, triturate with a small quantity of calcium chloride solution (as described under Pancreatin), previously cooled to a temperature below 5°C. Transfer the resulting solution to a 100 ml volumetric flask, add calcium chloride solution to volume, mix well. Measure accurately a quantity of liquid, dilute with borate BS (as described under Pancreatin), previously cooled to a temperature below 5°C to produce a solution of about 0.12 Units of trypsin per ml. Carry out the method described under Pancreatin.

Amylase Weigh accurately a quantity of the mixed contents in the test for weight variation of contents equivalent to about 0.45 g of pancreatin to a mortar, triturate with a small quantity of phosphate BS (as described under Pancreatin), previously cooled to a temperature below 5°C, dilute with the same phosphate BS to produce a solution of 10-12 Units of amylase per ml. Carry out the method described under Pancreatin.

Lipase Weigh accurately a quantity of the mixed contents in the test for weight variation of contents to a mortar, triturate with a small quantity of trometamol BS (as described under Pancreatin), previously cooled to a temperature below 5°C, dilute with the same BS to produce a solution of 8-16 Units of lipase per ml. Carry out the method described under Pancreatin.

Category As described under Pancreatin.

Strength 0.15 g

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Pancreatin Enteric-coated Tablets

Pancreatin Enteric-coated Tablets contain not less than 540 Units of protease, not less than 6300 Units of amylase and not less than 3400 Units of lipase per gram, calculated with reference to the labelled amount of pancreatin.

Description Enteric-coated tablets with white to pale yellow core

Microbial limit Comply with the test for Microbial limit (Appendix XI J) except that number of bacterial is not more than 10000 and that of fungus is not more than 100 per g.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Activity of enzyme *Protease* Pulverize finely 5 (0.3 g) or 3 (0.5 g) tablets with the coating removed, triturate with a small quantity of calcium chloride solution, previously cooled to a temperature below 5°C. Add calcium chloride solution to produce 200 ml, shake thoroughly. Measure accurately a quantity of the liquid, dilute with borate BS, previously cooled to a temperature below 5°C to produce a solution containing 0.12 Units of protease per ml. Carry out the method described under Pancreatin.

Amylase Pulverize finely 5 (0.3 g) or 3 (0.5 g) tablets with the coating removed, triturate with a small quantity of phosphate BS, previously cooled to a temperature below 5°C, dilute with phosphate BS to produce a solution containing 10-12 Units of amylase per ml. Carry out the method described under Pancreatin.

Lipase Pulverize finely 5 (0.3 g) or 3 (0.5 g) tablets with the coating removed, triturate with a small quantity of trometamol BS (as described under pancreatin), previously cooled to a temperature 5°C, dilute with the same BS to produce a solution containing 8-16 Units of lipase per ml. Carry out the method described under Pancreatin.

Category As described under Pancreatin.

Strength (1) 0.3 g (2) 0.5 g

Pantoprazole Sodium

$C_{16}H_{14}F_2N_3NaO_4S \cdot H_2O$ 423.38

Pantoprazole Sodium is 5-difluoromethoxy-2-[[(3,4-dimethoxy-2-pyridinyl) methyl] sulfinyl]-1H-benzimidazole sodium, monohydrate. It contains not less than 98.0% and not more than 102.0% of $C_{16}H_{14}F_2N_3NaO_4S$, calculated on anhydrous basis.

Description A white or almost white crystalline powder. Freely soluble in water or methanol; practically insoluble in chloroform or ether.

Identification (1) Dissolve 10 mg in 20 ml of water to 2 ml of the resulting solution add 5 drops of dilute hydrochloric acid, then add 1 ml of silicotungstic acid TS dropwise, a white curdy precipitate is produced.

(2) The light absorption of a solution of 15 µg per ml in ethanol exhibits a maximum at 292 nm, and a minimum at 250 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pantoprazole sodium (Appendix XVI).

(4) Yields the reactions characteristic of sodium salts

Alkalinity An aqueous solution of 20 mg per ml, pH 9.5-11.0 (Appendix VI H).

Clarity and colour of solution Dissolve 0.20 g in 10 ml of water, the solution is clear and colourless; any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Dissolve a quantity of the substance being examined with mobile phase to produce a solution of 0.2 mg per ml as test solution. Measure accurately 1 ml of the test solution, to a 100 ml volumetric flask, dilute to volume with mobile phase, mix well as reference solution. Carry out the method as described under the Assay. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for triple the retention time of the principal peak. The sum of the areas of the secondary peaks is not greater than 4/5 of the area (for injection) or not greater than the area (for oral administration) of the principal peak in the chromatogram obtained with the reference solution.

Toluene Transfer 50 mg, accurately weighed, to a 10 ml headspace vial, add 5 ml of 10% dimethylformamide solution, accurately measured, close tightly as test preparation. Dissolve a quantity of toluene, accurately weighed, in 10% dimethylformamide solution to produce a solution of 0.5 µg per ml, transfer 5 ml of the solution, accurately measured, to a 10 ml headspace vial and close tightly as reference preparation. Heat the vials in a water bath maintained at 60°C for 40 minutes separately. Carry out the method for gas chromatography (Appendix V E), using a column packed with porous polymer beads of divinyl-ethylvinylbenzene as the stationary phase, and maintain the column temperature at 180°C. Inject separately 1 ml each of the test preparation and reference preparation into the column. The content of toluene is not more than 0.089%.

Acetone Transfer 0.10 g, accurately weighed, to a 10 ml volumetric flask, dilute with water to volume, mix well as test preparation. Dissolve a quantity of acetone, accurately weighed, in water to produce a solution of 10 µg per ml as reference preparation. Complies with the test for Residue so vent Appendix VIII P, method 3, using a column packed with porous polymer beads of divinyl-ethylvinylbenzene as the stationary phase and maintain the column temperature at 150°C. Inject separately 1 µl each of the test preparation and the reference preparation into the column. The content of acetone complies with the requirement.

Water 4.0%-6.0% (Appendix VIII M, method 1).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2); not more than 0.002%, using 1.0 g.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer solution (dissolve 1.12 g of disodium hydrogen phosphate and 0.18 g of sodium dihydrogen phosphate in water, and dilute to 1000 ml, mix well, and adjust to pH 7.6)-acetonitrile (70 : 30) as the mobile phase. The detection wavelength is 288 nm. The number of the theoretical plate of the column is not less than 2500, calculated with reference to the peak of pantoprazole.

Procedure Protect from light throughout the procedure. Dissolve a quantity of the substance being examined, weigh

accurately, in mobile phase to produce a solution of about 60 µg per ml. Inject 20 µl into the column and record the chromatogram. Repeat the operation using Pantoprazole Sodium CRS instead of the substance being examined. Calculate the content of $C_{18}H_{14}F_2N_3NaO_4S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Digestive system medicine.

Storage Preserve in tightly closed containers, stored in a cool place and dark place.

Preparation Pantoprazole Sodium for Injection

Papaverine Hydrochloride

$C_{20}H_{21}NO_4 \cdot HCl$ 375.85

[61-25-6]

Papaverine Hydrochloride is 1-[(3,4-dimethoxyphenyl)methyl]-6,7-dimethoxyisoquinoline Hydrochloride. It contains not less than 99.0% of $C_{20}H_{21}NO_4 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless. Soluble in chloroform; sparingly soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Identification (1) Dissolve 0.1 g in 10 ml of water, heat to about 50°C. Add a slight excess of ammonium hydroxide TS dropwise to make alkaline and stir to precipitate. Allow to stand for 5 minutes, filter, wash the precipitate with small quantities of water and dry at 105°C for 1 hour. It melts at 146-148°C (Appendix VI C).

(2) Dissolve 10 mg in 10 ml of water, add 3 drops of dilute hydrochloric acid and 5 drops of potassium ferricyanide TS; a pale yellow precipitate is produced (distinction from other opium alkaloids).

(3) Dissolve 5 mg in 1 ml of formaldehyde-sulfuric acid TS, a colourless or pale yellow solution is produced, which gradually changes to deep rose and finally becomes violet (morphine and its esters develop purple or violet colour immediately).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Papaverine Hydrochloride (Appendix XVI).

(5) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 10 ml of water, pH 3.0-4.0 (Appendix VI H).

Colour of solution Dissolve 0.2 g in 10 ml of freshly boiled and cold water. Any colour produced is not more intense than that of the reference solution OY₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-ethyl acetate-diethylamine (70 : 20 : 12) as the mobile phase. Apply

mixture of equal volumes of ethanol and water containing (1) 50 mg per ml, (2) 0.50 mg per ml of the substance being examined. After developing and removal of the plate, dry in air until the diethylamine is volatilized and examine under ultraviolet light (254 nm). No spot other than the principal spot in the chromatogram obtained with solution (1) is more intense than the principal spot obtained with solution (2).

Readily carbonisable substances Dissolve 50 mg in 2 ml of sulfuric acid. Any colour produced is not more intense than that of an equal volume of reference solution [dilute 2 ml of potassium permanganate solution (0.02 mol/L) with water to 1000 ml].

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid and 6 ml of mercuric acetate TS. Add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 37.58 mg of $C_{20}H_{21}NO_4 \cdot HCl$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Papaverine Hydrochloride Injection
(2) Papaverine Hydrochloride Tablets

Papaverine Hydrochloride Injection

Papaverine Hydrochloride Injection is a sterile solution of Papaverine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of $C_{20}H_{21}NO_4 \cdot HCl$.

Description A clear, colourless or slightly orange yellow liquid.

Identification Evaporate 5 ml to dryness on a water bath, the residue complies with the tests (1), (2), (3) and (5) for Identification described under Papaverine Hydrochloride.

pH value 2.5-4.0 (Appendix VI H).

Colour Not more intense than the colour of the reference solution OY₅ (Appendix IX A, method 1).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 10 ml, evaporate to dryness on a water bath, dry at 105°C for 1 hour and allow to cool. Dissolve the residue in 10 ml of glacial acetic acid and 6 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 37.58 mg of $C_{20}H_{21}NO_4 \cdot HCl$.

Category As described under Papaverine Hydrochloride.

Strength 1 ml : 30 mg

Storage Preserve in well closed containers, protected from light.

Papaverine Hydrochloride Tablets

Papaverine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the base, calculated as the hydrochloride ($C_{20}H_{21}NO_4 \cdot HCl$).

Description White tablets.

Identification Shake to dissolve a quantity of the powdered tablets equivalent to about 60 mg of papaverine hydrochloride in 10 ml of water, filter, the filtrate complies with tests (2), (3) and (5) for Identification described under Papaverine Hydrochloride.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exact 30 minutes and filter. Dilute the successive filtrate with 0.1 mol/L hydrochloric acid solution to produce a solution of 2.4 µg per ml. Measure the absorbance of the resulting solution at 250 nm (Appendix IV A), calculate the dissolution of $C_{20}H_{21}NO_4 \cdot HCl$ from each tablet, taking 1830 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with a quantity of water and transfer to a 250 ml volumetric flask with 50 ml of water in portions, add 3 ml of hydrochloric acid, shake for 15 minutes, dilute with water to volume and mix well, filter. Transfer 1 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 250 nm (Appendix IV A), calculate the content of $C_{20}H_{21}NO_4 \cdot HCl$, taking 1830 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powdered tablets equivalent to about 0.12 g of papaverine hydrochloride to a separator, add 20 ml of water, mix well, add 7.5 ml of ammonia TS. Extract with 6 portions of chloroform (30 ml, 15 ml, 10 ml, 10 ml, 10 ml, 10 ml), wash each chloroform extract with the same 10 ml of water. Filter through absorbent cotton moistened by chloroform, wash twice the filter with each of 10 ml chloroform, combine the filtrate and washings, evaporate to dryness on a water bath. To the residue add 5 ml of dehydrated ethanol, evaporate to dryness, add another 5 ml of dehydrated ethanol, evaporate until no characteristic odour of ethanol is perceptible, then dry it at 105°C for half an hour. Shake to dissolve the residue in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.05 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS is equivalent to 18.79 mg of $C_{20}H_{21}NO_4 \cdot HCl$.

Category As described under Papaverine Hydrochloride.

Strength 30 mg

Storage Preserve in tightly closed containers, protected from light.

Paracetamol

$C_8H_9NO_2$ 151.16

[103-90-2]

Paracetamol is 4'-hydroxyacetyl phenyl amine. It contains not less than 98.0% and not more than 102.0% of $C_8H_9NO_2$, calculated on the dried basis.

Description A white crystalline powder or crystal; odourless; taste, slightly bitter. Very soluble in hot water or ethanol; soluble in acetone; sparingly soluble in water.

Melting range 168-172°C (Appendix VI C).

Identification (1) To the aqueous solution add ferric chloride TS, a bluish-violet colour is produced.

(2) Heat about 0.1 g with 5 ml of dilute hydrochloric acid in a water bath for 40 minutes and cool. To 0.5 ml of the solution add 5 drops of sodium nitrite TS, mix well; dilute with 3 ml of water, add 2 ml of alkaline β-naphthol TS and shake; a red colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of paracetamol (Appendix XVI).

Acidity Dissolve 0.10 g in 10 ml of water, pH 5.5-6.5 (Appendix VI H).

Clarity and colour of ethanol solution A solution of 1.0 g in 10 ml of ethanol is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of the reference solution BR₂ or OR₂ (Appendix IX A, method 1).

Chlorides Dissolve 2.0 g in 100 ml of water by heating, cool and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate obtained in the test for chlorides. Any opalescence produced is not more intense than that of a reference using 1.0 ml of potassium sulfate standard solution (0.02%).

Related substances Place 1.0 g of the finely powdered substance in a centrifugal tube or a test tube with stopper and shake for 30 minutes with 5 ml of ether. Centrifuge or allow to stand until the solution is clear. The supernatant solution is used as test solution. Prepare a reference solution by dissolving 1.0 mg of *p*-chloroacetanilide in 1 ml of ethanol and dilute to 50 µg per ml with ether. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and chloroform-acetone-toluene (13 : 5 : 2) as the mobile phase. Apply separately to the plate (1) 200 µl of the test solution, (2) 40 µl of the reference solution. After developing and removal of the plate, dry in air and examine under an ultraviolet light (254 nm). Any spot, other than the principal spot, in the chromatogram obtained with solution

solution (2).

4-Aminophenol Dissolve 1.0 g in 20 ml of methanol solution (1→2), add 1 ml of alkaline sodium nitroprusside TS, mix well and allow to stand for 30 minutes. Any colour produced is not more intense than that of a reference prepared in the same manner using a mixture of 1.0 g of paracetamol CRS and 50 µg of 4-aminophenol (0.005%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 20 ml of water by heating in a water bath, cool and filter. To the filtrate add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 40 mg, accurately weighed, in 50 ml of 0.4% sodium hydroxide solution in a 250 ml volumetric flask, dilute with water to volume and mix well. Transfer 5 ml, accurately measured, to a 100 ml volumetric flask, add 10 ml of 0.4% sodium hydroxide solution and then dilute with water to volume, mix well. Measure the absorbance of the resulting solution at 257 nm (Appendix IV A). Calculate the content of $C_8H_9NO_2$, taking 715 as the value of A (1%, 1 cm).

Category Analgesic and antipyretic agent.

Storage Preserve in tightly closed containers.

Preparation (1) Paracetamol Capsules
(2) Paracetamol Chewable Tablets
(3) Paracetamol Drops
(4) Paracetamol Effervescent Tablets
(5) Paracetamol Gel
(6) Paracetamol Granules
(7) Paracetamol Injection
(8) Paracetamol Suppositories
(9) Paracetamol Tablets

Paracetamol and Caffeine Tablets

Paracetamol and Caffeine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of paracetamol ($C_8H_9NO_2$) and caffeine ($C_8H_{10}N_4O_2$).

Description Pale yellow or yellow tablets or film coated tablets.

Identification The retention time of two principal peaks in the chromatogram of the test solution obtained under the Assay corresponds with that of the principal peaks in the chromatogram of the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 20 ml of the solution after exact 30 minutes and filter. Measure accurately 10 ml of the successive filtrate and 5 ml of internal standard solution as described under the Assay, into a 50 ml volumetric flask, dilute with a mixture of methanol-glacial acetic acid (95 : 5) to volume, mix well, as test solution. Carry out the method as described under Assay. Calculate separately the dissolution of $C_8H_9NO_2$ and $C_8H_{10}N_4O_2$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel, and a mixture of methanol-water-glacial acetic acid (28 : 69 : 3) as the mobile phase. Detection wavelength is 275 nm. The resolution factors between the peaks of paracetamol, caffeine and internal standard comply with the related requirements.

Internal standard solution Dissolve a quantity of benzoic acid with methanol to produce a solution of 3.5 mg per ml.

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, equivalent to about 0.25 g of paracetamol, into a 100 ml volumetric flask, add about 75 ml of a mixture of methanol-glacial acetic acid (95 : 5), shake 30 minutes to dissolve paracetamol and caffeine, dilute with the mixture to volume, shake thoroughly and filter. Measure accurately 2 ml of the successive filtrate and 5 ml of internal standard solution into a 50 ml volumetric flask, dilute with the mixture of methanol-glacial acetic acid (95 : 5) to volume, mix well as test solution. Prepare a solution of 2.5 mg of paracetamol CRS and 0.3 mg of caffeine CRS per ml in a mixture of methanol-glacial acetic acid (95 : 5). Measure accurately 2 ml of the resulting solution and 5 ml of internal standard solution into a 50 ml volumetric flask, dilute with a mixture of methanol-glacial acetic acid (95 : 5) to volume, mix well as reference solution. Inject separately 10 µl each of the test solution and the reference solution into the column and record the chromatogram. Calculate the content of $C_8H_9NO_2$ and $C_8H_{10}N_4O_2$ with respect to the peak area obtained in the chromatogram by internal standard method.

Category Analgesic and antipyretic agent.

Strength (1) paracetamol 250 mg, caffeine 32.5 mg
(2) paracetamol 500 mg, caffeine 65 mg

Storage Preserve in tightly closed containers, protected from light.

Paracetamol Capsules

Paracetamol Capsules contain not less than 95.0% and not more than 105.0% of the labelled amount of Paracetamol ($C_8H_9NO_2$).

Identification Triturate a quantity of the contents, equivalent to about 0.5 g of paracetamol with 20 ml of ethanol in portions to dissolve paracetamol. Filter, combine the filtrates and evaporate to dryness; the residue complies with the test (1) and (2) for Identification described under Paracetamol.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Dissolution Carry out the dissolution test (Appendix XI C, method 2), using 24 ml dilution hydrochloric acid diluted with water to produce 1000 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. At 45 minutes, carry out the Dissolution as described under paracetamol tablets beginning at the words "to withdraw 5 ml...". Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I 'E').

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 40 mg of paracetamol in a 250 ml

solution and 50 ml of water, shake, then dilute with water to volume, mix well. Filter, discard the initial filtrate. Measure accurately 5 ml of the successive filtrate, carry out the Assay as described under paracetamol beginning at the words "to a 100 ml of volumetric flask. . .".

Category As described under Paracetamol.

Strength 0.3 g

Storage Preserve in tightly closed containers.

Paracetamol Chewable Tablets

Paracetamol Chewable Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description Tablets with colouring agents, taste, sweet.

Identification Triturate a quantity of the powdered tablets equivalent to about 0.5 g of paracetamol with 20 ml of ethanol in portions to dissolve paracetamol. Filter, combine the filtrates and evaporate to dryness, the residue complies with the tests (1) and (2) for Identification described under Paracetamol.

4-Aminophenol Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.05 mol/L ammonium acetate solution-methanol (85 : 15) as the mobile phase. Detection wavelength is 257 nm and the number of theoretical plates of column is not less than 5000, calculated with reference to the peak of paracetamol. The resolution factor between the peaks of paracetamol and 4-aminophenol complies with the related requirements.

Procedure Weigh accurately a quantity of the powder equivalent to about 100 mg of paracetamol in a 10 ml volumetric flask, add a quantity of mobile phase and shake to dissolve paracetamol, dilute with mobile phase to volume and mix well. Filter and use the successive filtrate as the test solution (prepared before used). Prepare a reference solution of 10 µg of 4-aminophenol CRS per ml with mobile phase. Inject 10 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% full scale of the chart. Inject 10 µl each of the test solution and reference solution into column, record the chromatogram. Calculate the content of 4-aminophenol with respect to the peak area by the external standard method. It is not more than 0.1% of the labelled amount of paracetamol.

Other requirements Comply with the general requirements for tablets except disintegration test (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 40 mg of paracetamol in a 250 ml volumetric flask, add 50 ml of 0.4% sodium hydroxide solution and 50 ml of water, shake to dissolve paracetamol, dilute with water to volume and mix well. Filter and transfer accurately 5 ml of the successive filtrate, carry out the Assay as described under paracetamol beginning at the words "to a 100 ml of volumetric flask. . .".

Category As described under paracetamol.

Strength (1) 80 mg (2) 160 mg

Storage Preserve in tightly containers, stored in a cool place and protected from light.

Paracetamol Drops

Paracetamol drops contain not less than 90.0% and not more than 110.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description A clear liquid with colouring agents.

Identification (1) To 20 ml, add 20 ml of chloroform, shake and allow it to separate. To evaporate the chloroform layer to dryness, the residue complies with the tests (2) for Identification described under Paracetamol.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that principal peak in the chromatogram of the reference solution.

4-Aminophenol Dissolve a quantity of the substance being examined in water to produce a solution of 2 mg of paracetamol per ml, mix well as the test solution (prepared before used). Prepare a reference solution of 2 µg of 4-aminophenol CRS per ml with water. Carry out the method as described under Assay. Inject 10 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% full scale of the chart. Inject separately 10 µl of the test solution and reference solution into column, record the chromatogram. Calculate the content of 4-aminophenol with respect to the peak area by the external standard method. It is not more than 0.1% of the labelled amount of paracetamol.

Relative density 1.070-1.150 (Appendix VI A).

pH value 4.5-6.5 (Appendix VI H).

Other requirements Comply with the general requirements for oral solutions (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L ammonium acetate solution-methanol (85 : 15) as the mobile phase. Detection wavelength is 257 nm and the number of theoretical plates of column is not less than 5000, calculated with reference to the peak of paracetamol. The resolution factor between the peaks of paracetamol and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of theophylline in water to produce a solution of 1.0 mg per ml, mix well.

Procedure Dissolve a quantity of the substance being examined, accurately measured, in water to produce a solution of 0.6 mg of paracetamol per ml as the test solution. Transfer 5 ml each of the test solution and the internal standard solution, both measured accurately in a 50 ml volumetric flask, dilute with water to volume and mix well. Inject 10 µl into the column, record the chromatogram. Repeat the operation, using paracetamol CRS instead of substance being examined. Calculate the content of $C_8H_9NO_2$.

Category As described under paracetamol.

Strength (1) 10 ml : 1 g (2) 15 ml : 1.5 g
(3) 16 ml : 1.6 g

Storage Preserve in tightly closed containers and protected from light.

Paracetamol Effervescent Tablets

Paracetamol Effervescent Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description White or pale yellow tablets, the surface with some yellow points.

Identification (1) Triturate a quantity of the powdered tablets equivalent to about 0.5 g of paracetamol with 20 ml of ethanol in portions to dissolve paracetamol. Filter, combine the filtrates and evaporate to dryness, the residue complies with the tests (2) for Identification described under Paracetamol.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that principal peak in the chromatogram of the reference solution.

Acidity Disintegrate 1 tablet in 100 ml of water at 15–25°C, pH 4.5–6.0 (Appendix VI H).

4-Aminophenol Weigh accurately a quantity of the powder equivalent to about 25 mg of paracetamol in a 50 ml volumetric flask, add a quantity of mobile phase and shake to dissolve paracetamol, dilute with mobile phase to volume and mix well. Filter and use the successive filtrate as the test solution (prepared before used). Prepare a reference solution of 0.5 µg of 4-aminophenol CRS per ml with mobile phase. Carry out the method as described under Assay. Inject 10 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% full scale of the chart. And then inject 10 µl each of the test solution and reference solution into column, record the chromatogram. Calculate the content of 4-aminophenol with respect to the peak area by the external standard method. It is not more than 0.1% of the labelled amount of paracetamol.

Other requirements Comply with the general requirements for tablets except friability test (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (pH 4.5) [dissolve 15.04 g sodium dihydrogen phosphate ($NaH_2PO_4 \cdot 2H_2O$) and 0.0627 g disodium hydrogen phosphate in 1000 ml of water, adjust pH to 4.5]–methanol (80 : 20) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of column is not less than 5000, calculated with reference to the peak of paracetamol. The resolution factor between the peaks of paracetamol and 4-aminophenol complies with the related requirements.

Procedure Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 25 mg of paracetamol in a 50 ml volumetric flask, dilute with the mobile phase to volume, mix well. Filter and transfer accurately 10 ml the successive filtrate into a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well. Inject 10 µl into the column, record the chromatogram. Repeat the operation, using paracetamol CRS instead of substance being examined. Calculate the content of $C_8H_9NO_2$.

Category As described under paracetamol.

Strength (1) 0.1 g (2) 0.5 g

Storage Store in tightly closed containers.

Paracetamol Gel

Paracetamol Gel contain not less than 90.0% and not more than 110.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description Pale yellow transparent and semisolid gel; taste, sweet.

Identification (1) To a quantity of the mixed contents equivalent to about 50 mg of paracetamol, add 10 ml of water and heat in a warm water bath with shaking to dissolve paracetamol. Filter and add ferric chloride TS to the filtrate, a blue colour is produced.

(2) The light absorption of the test solution obtained in the Assay exhibits a maximum at 248 nm (Appendix IV A).

Acidity Dissolve 1.0 g in 20 ml of water, heat to dissolve paracetamol, cool, pH 4.0–5.5 (Appendix VI H).

Other requirements Comply with the general requirements for gel (Appendix I U).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and methanol–water–phosphoric acid (22 : 78 : 0.1) as the mobile phase. Detection wavelength is 248 nm and the number of theoretical plates of column is not less than 1000, calculated with reference to the peak of paracetamol.

Procedure Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 20 mg of paracetamol, to a 100 ml volumetric flask, add a quantity of water, heat in a warm water bath with shaking to dissolve paracetamol, cool to room temperature, dilute with water to volume, mix well. Filter and transfer accurately 3 ml the successive filtrate into a 50 ml volumetric flask, dilute with methanol to volume and mix well, as the test solution. Inject 10 µl into the column, record the chromatogram. Repeat the operation, using a solution of 12 µg per ml of paracetamol CRS in methanol. Calculate the content of $C_8H_9NO_2$.

Category As described under paracetamol.

Strength 5 g : 0.12 g

Storage Preserve in tightly containers and protected from light.

Paracetamol Granules

Paracetamol Granules contain not less than 95.0% and not more than 105.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description white or almost white granules; taste, sweet.

Identification Triturate a quantity of the granules equivalent to about 0.5 g of paracetamol with 20 ml of ethanol in portions to dissolve paracetamol. Filter, combine the filtrates and evaporate to dryness, the residue complies with the tests (1) and (2) for Identification described under Paracetamol.

4-Aminophenol Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.05 mol/L

mobile phase. Detection wavelength is 257 nm and the number of theoretical plates of column is not less than 5000, calculated with reference to the peak of paracetamol. The resolution factor between the peaks of paracetamol and 4-aminophenol complies with the related requirements.

Procedure Weigh accurately a quantity of the mixed contents in the test for weight variation of contents equivalent to about 100 mg of paracetamol in a 10 ml volumetric flask, add a quantity of mobile phase and shake to dissolve paracetamol, dilute with mobile phase to volume and shake well. Filter and use the successive filtrate as the test solution (Prepared before used). Prepare a reference solution of 10 µg of 4-aminophenol CRS per ml in mobile phase. Inject 10 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% full scale of the chart. Inject 10 µl each of the test solution and reference solution into column, record the chromatogram. Calculate the content of 4-aminophenol with respect to the peak area by the external standard method. It is not more than 0.1% of the labelled amount of paracetamol.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 24 ml dilution hydrochloric acid diluted with water to produce 1000 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exact 30 minutes and filter. Dilute a quantity of successive filtrate with 0.04% sodium hydroxide to produce a solution of 8 µg of paracetamol per ml, mix well. Measure the absorbance of the resulting solution at 257 nm (Appendix IV A). Calculate the dissolution of $C_8H_9NO_2$ from each container, taking 715 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 40 mg of paracetamol in a 250 ml volumetric flask, add 50 ml of 0.4% sodium hydroxide solution and 50 ml of water, shake, then dilute with water to volume and mix well. Filter and transfer accurately 5 ml of the successive filtrate, carry out the Assay as described under paracetamol beginning at the words "to a 100 ml of volumetric flask..."

Category As described under paracetamol.

Strength (1) 0.1 g (2) 0.16 g (3) 0.25 g (4) 0.5 g

Storage Preserve in tightly closed containers, stored in a cool place.

Paracetamol Injection

Paracetamol Injection is a sterile solution of Paracetamol in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of paracetamol ($C_8H_9NO_2$). It may contain a sufficient quantity of stabilizers and auxiliary solubilizer.

Description A colourless or almost colourless slightly viscous clear liquid.

Identification Complies with the Tests (1) and (2) for Identification described under paracetamol.

pH value 4.5-6.5 (Appendix VI H)

for injections (Appendix I B).

Assay To a quantity of the injection add 0.01 mol/L sodium hydroxide to produce a solution of 6 µg per ml, measure the absorbance at 257 nm (Appendix VI A). Calculate the content of $C_8H_9NO_2$, taking 715 as the value of A (1%, 1 cm).

Category As described under Paracetamol.

Strength (1) 1 ml : 0.075 g (2) 2 ml : 0.25 g

Storage Preserve in well closed containers, protected from light.

Paracetamol Suppositories

Paracetamol Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description Creamy-white to faint yellow suppositories.

Identification (1) To a quantity of suppositories equivalent to about 0.3 g of paracetamol add 20 ml of water, melt by heating on a water bath at 60°C, shake for 5 minutes, cool in an ice bath and filter. Measure 5 ml of the filtrate, add 1 drop of ferric chloride TS; a bluish-violet precipitate is produced.

(2) To 5 ml of the filtrate obtained in test (1) for Identification add 5.0 ml of the dilute hydrochloric acid, heat on a water bath for 30 minutes, cool, add dropwise a few drops of sodium nitrite TS and alkaline 2-naphthol TS; a precipitate coloured from orange yellow to scarlet red is produced.

(3) To 3 ml of the filtrate obtained in test (1) for identification add 1.5 ml of hydrochloric acid, boil for 3 minutes, add water to about 10 ml, cool, no precipitate is produced, add 1 drop of 0.01667 mol/L potassium dichromate solution, a violet colour is produced gradually which do not change to red colour.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Weigh accurately and cut 10 suppositories to chips, mix well. Weigh accurately a quantity equivalent to about 0.25 g of paracetamol in a 250 ml volumetric flask. Add 80 ml of 0.01 mol/L sodium hydroxide solution about 60°C, shake for 10 minutes. Allow to cool to room temperature, dilute with 0.01 mol/L sodium hydroxide solution to volume, allow to stand on a cold water bath for 1 hour and filter. Discard the initial filtrate, measure accurately 10 ml of the successive filtrate at room temperature to a 100 ml volumetric flask, dilute with 0.01 mol/L sodium hydroxide solution to volume and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 257 nm (Appendix IV A), calculate the content of $C_8H_9NO_2$, taking 715 as the value of A (1%, 1 cm).

Category As described under Paracetamol.

Strength (1) 0.15 g (2) 0.3 g (3) 0.6 g

Storage Preserve in tightly closed containers, stored in a cool place.

Paracetamol Tablets

and not more than 105.0% of the labelled amount of paracetamol ($C_8H_9NO_2$).

Description White tablets, film coated or glutin coated tablets with white core.

Identification Triturate a quantity of powdered tablets equivalent to about 0.5 g of paracetamol with 20 ml of ethanol in portions to dissolve paracetamol. Filter, combine the filtrates and evaporate to dryness, the residue complies with the tests (1) and (2) for Identification described under Paracetamol.

Dissolution Carry out the dissolution test (Appendix X C, method 1) using 24 ml of dilute hydrochloric acid diluted to 1000 ml with water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 5 ml of the solution after exact 30 minutes and filter. Discard the initial filtrate, measure accurately 1 ml of the successive filtrate and dilute with 0.04% sodium hydroxide solution to 50 ml, mix well. Measure the absorbance of the resulting solution at 257 nm (Appendix IV A). Calculate the dissolution of $C_8H_9NO_2$ from each tablet, taking 715 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To an accurately weighed quantity equivalent to about 40 mg of paracetamol in a 250 ml volumetric flask add 50 ml of 0.4% sodium hydroxide solution and 50 ml of water, shake for 15 minutes, dilute with water to volume and mix well. Filter and discard the initial filtrate. Transfer accurately 5 ml of the successive filtrate to a 100 ml volumetric flask and carry out the Assay described under Paracetamol, beginning at the words "add 100 ml of...".

Category As described under Paracetamol.

strength (1) 0.1 g (2) 0.3 g (3) 0.5 g

Storage Preserve in tightly closed containers.

Paracetamol and Codeine Phosphate Tablets (I)

Paracetamol and Codeine Phosphate Tablets contain not less than 475 mg and not more than 525 mg of Paracetamol ($C_8H_9NO_2$), and not less than 7.56 mg and not more than 9.24 mg of Codeine Phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2} H_2O$) in each tablet.

Formula	Paracetamol	500 g
	Codeine Phosphate	8.4 g
	Excipients	a quantity
	to make	1000 tablets

Description White tablets.

Identification (1) To about 0.1 g of the powdered tablets add 10 ml of water, shake to dissolve Paracetamol. Filter, and add ferric chloride TS to the filtrate; a bluish purple colour is produced.

(2) To about 0.1 g of the powdered tablets add 5 ml of dilute hydrochloric acid, heat on a water bath for 30 minutes, allow to cool. To 0.5 ml of the above solution add

of water, add 2 ml of alkaline β -naphthol TS and mix well, a red colour is produced.

(3) To about 0.5 g of the powdered tablets add 5 ml of water, shake to dissolve Codeine Phosphate. Filter and transfer the filtrate to a separator, add dropwise of ammonia TS to make the filtrate alkaline. Add 10 ml of chloroform and mix well, evaporate the chloroform layer on a water bath to dryness. To the residue add 0.5 ml of sulfuric acid containing 2.5 mg of selenic acid, a green colour is produced which turns to blue gradually.

Content uniformity Comply with the requirements of content uniformity (Appendix X E). Triturate 1 tablet in a mortar and transfer to a 250 ml volumetric flask with water in portions. Carry out the method as described under Assay, beginning at the words "add 200 ml of water...".

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket at 100 rpm. Withdraw a quantity of the solution after exact 30 minutes and filter through a membrane filter. The successive filtrate is used as the test solution. Prepare the reference solution as described under the Assay. Measure 20 μ l of each of the two solutions, carry out the method in the Assay. Calculate the dissolution from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-methanol-tetrahydrofuran (50 : 10 : 4) as the mobile phase. Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of Codeine Phosphate. The resolution factor between the peaks of Paracetamol and Codeine Phosphate complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets. To a quantity accurately weighed, equivalent to about 8.4 mg of Codeine Phosphate and 500 mg of Paracetamol, add 200 ml of water in a 250 ml volumetric flask, sonicate for 10 minutes, add water to volume, shake thoroughly. Filter through a membrane filter. Inject 10 μ l of the successive filtrate into the column, accurately measured, record the chromatogram. Dissolve a quantity of Codeine Phosphate CRS and Paracetamol CRS in water, accurately weighed, to produce a solution of 0.03 mg of Codeine Phosphate and 2 mg of Paracetamol per ml, repeat the operation. Calculate the content of Paracetamol and Codeine Phosphate respectively with respect to the peak areas obtained in the chromatogram by the external standard method. The coefficient 1.068 is multiplied in the calculation of the content of Codeine Phosphate.

Category Analgetic.

Storage Preserve in tightly closed container, protected from light.

Paracetamol and Codeine Phosphate Tablets (II)

Paracetamol and Codeine Phosphate Tablets contain not less than 270 mg and not more than 330 mg of Paracetamol ($C_8H_9NO_2$), and not less than

Phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2} H_2O$) in each tablet.

Formula	Paracetamol	300 g
	Codeine Phosphate	15 g
	Excipients	a quantity
	to make	1000 tablets

Description White tablets.

Identification (1) To about 0.1 g of the powdered tablets add 10 ml of water, shake to dissolve Paracetamol. Filter, and add ferric chloride TS to the filtrate; a purple colour is produced.

(2) To about 0.5 g of the powdered tablets add 5 ml of water, shake to dissolve Codeine Phosphate. Filter, and transfer the filtrate to a separator, add dropwise of ammonia TS to make the filtrate alkaline. Add 10 ml of chloroform and mix well, evaporate the chloroform layer on a water bath to dryness. To the residue add 0.5 ml of sulfuric acid containing 2.5 mg of selenic acid, a green colour is produced which turns to blue gradually.

(3) To about 0.2 g of the powdered tablets in a conical flask with stopper add 25 ml of methanol, shake to dissolve Paracetamol CRS and Codeine Phosphate. Filter, and use the successive filtrate as the test solution. Dissolve Paracetamol CRS and Codeine Phosphate CRS in methanol to produce a solution containing 6 mg of Paracetamol and 0.3 mg of Codeine Phosphate per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (85 : 10 : 5) as the mobile phase. Apply separately to the plate 5 µl of each of the above two solutions. After developing and removal of the plate, dry in air, and examine under ultraviolet light (254 nm). The two principal dark spots in the chromatogram obtained with the test solution correspond in position to the principal spots obtained with the reference solution. Then spray with oil-soluble bi-ortho-nitric TS, the spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot of Codeine Phosphate obtained with the reference solution.

Content uniformity *Codeine Phosphate* Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with water in a beaker and transfer to a 50 ml volumetric flask with water in portions, sonicate for 10 minutes, dilute with water to volume, shake thoroughly and filter through a membrane filter of not more than 0.45 µm. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with the mobile phase to volume and mix well, used as the test solution. Weigh accurately 15 mg of Codeine Phosphate CRS, in a 50 ml volumetric flask, add water to dissolve Codeine Phosphate and dilute to volume, shake thoroughly. Measure accurately 5 ml to a 25 ml volumetric flask, and dilute with the mobile phase to volume and mix well, use as the reference solution. Carry out the method in the Assay and calculate the content of Codeine Phosphate.

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket at 100 rpm. Withdraw a quantity of the solution after exact 30 minutes and filter through a membrane filter. The successive filtrate is used as the test solution. Prepare the reference solution as described under the Assay. Measure 20 µl of each of the two solutions, carry out the method in the Assay.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-methanol-tetrahydrofuran (800 : 100 : 37.5) as the mobile phase (adjust to pH 4.0 with phosphoric acid). Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 2500, calculated with reference to the peak of Codeine Phosphate. The resolution factor between the peaks of Paracetamol and Codeine Phosphate complies with the related requirements.

Procedure Weigh accurately and powder 20 tablets. To a quantity accurately weighed, equivalent to about 15 mg of Codeine Phosphate and 300 mg of Paracetamol, add 200 ml of water in a 250 ml volumetric flask, sonicate for 10 minutes, add water to volume, shake thoroughly. Filter through a membrane filter. Inject 10 µl of the successive filtrate into the column, accurately measured, record the chromatogram. Dissolve a quantity of Codeine Phosphate CRS and Paracetamol CRS in water, accurately weighed, to produce a solution of 0.06 mg of Codeine Phosphate and 1.2 mg of Paracetamol per ml, repeat the operation. Calculate the content of Paracetamol and Codeine Phosphate respectively with respect to the peak areas obtained in the chromatogram by the external standard method. The coefficient 1.068 is multiplied in the calculation of the content of Codeine Phosphate.

Category Analgetic.

Storage Preserve in tightly closed container, protected from light.

Paromomycin Sulfate

$C_{23}H_{45}N_5O_{14} \cdot nH_2SO_4$

[1263-89-4]

Paromomycin Sulfate is O-2-amino-2-deoxy-α-D-glucopyranosyl-(1 → 4)-O-[O-2,6-diamino-2,6-dideoxy-β-L-idopyranosyl-(1 → 3)-β-D-ribofuranosyl-(1 → 5)]-2-deoxy-D-streptamine sulfate. It has a potency of not less than 700 Paromomycin Units per mg, calculated on the dried basis.

Description A white to pale yellow powder; odourless;

Freely soluble in water, insoluble in methanol, ethanol, acetone, chloroform or ether.

Specific optical rotation $+50^{\circ}$ to $+55^{\circ}$, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance and a mixture of 50% methanol containing 1.5% of sodium chloride-concentrated ammonia solution (100 : 8) as the mobile phase. Apply separately to the plate 1 μ l each of two solutions in water containing (1) 20 mg per ml of the substance being examined and (2) 20 mg of paromomycin RS per ml. After developing and removal of the plate, allow it to dry in air, then heat at 105°C , allow to cool and spray with a solution of ninhydrin in aqueous solution of pyridine diluted with water (dissolve 0.5 g of ninhydrin in 100 ml of 40% pyridine in water). The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of paromomycin Sulfate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity or alkalinity Dissolve a quantity in water to produce a solution of 50 mg per ml, pH 5.0-7.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C , loses not more than 7.0% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Paromomycin Units are equivalent to 1 mg Paromomycin.

Category Aminoglycoside antibiotic.

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Preparation Paromomycin Sulfate Tablets

Paromomycin Sulfate Tablets

Paromomycin Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled potency of paromomycin.

Description White to slight yellow tablets or sugar coated tablets with white to slight yellow core.

Identification To a quantity of the powdered tablets (with sugar coating removed) add water to produce a suspension containing 20 mg of Paromomycin per ml, shake thoroughly and filter. The filtrate complies with tests for Identification described under Paromomycin sulfate.

Other requirements Comply with the general requirements for tablets (Appendix I A), except that the plain tablets disintegrate within 30 minutes.

Assay Weigh accurately and powder 10 tablets or 4 sugar coated tablets. To a quantity of the powder equivalent to about 0.25 g of paromomycin add sterile water to produce a suspension of 1000 Unit per ml, shake thoroughly and allow to stand. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Paromomycin Sulfate.

Category As described under Paromomycin Sulfate.

Strength (1) 0.1 g (100000 Units)

(2) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Paroxetine Hydrochloride Tablets

Paroxetine hydrochloride tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of paroxetine ($\text{C}_{19}\text{H}_{20}\text{FNO}_3$).

Description Coated tablets with white core.

Identification The retention time of principal peak of the paroxetine hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of paroxetine hydrochloride CRS in the chromatogram of the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2). Using hydrochloric acid solution (9 \rightarrow 1000) 1000 ml as dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 20 ml of the solution after exact 45 minutes and filter. Dissolve about 23 mg of paroxetine hydrochloride CRS, accurately weighed, in dissolution medium in a 100 ml volumetric flask, add a quantity of dissolution medium and ultrasonicate to dissolve it, dilute with dissolution medium to the volume, mix well. Measure accurately 5 ml in a 50 ml volumetric flask, dilute with dissolution medium to the volume, mix well, as the reference solution. Inject 20 μ l each of above two solutions into the column, carry out the procedure as described under the Assay. Detection wavelength is 293 nm. Calculate the dissolution of $\text{C}_{19}\text{H}_{20}\text{FNO}_3$ from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with cyano bonded silica gel and a mixture of phosphate BS (dissolve 4.9 g of phosphoric acid in 800 ml of water, adjust pH value to 6.0 with 0.1 mol/L sodium hydroxide, dilute with water to 1000 ml)-acetonitrile (1 : 1) as the mobile phase. Detection wavelength is 295 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of paroxetine hydrochloride.

Procedure Transfer 10 tablets into a 250 ml volumetric flask, add 70 ml of water and 5 ml of 0.01 mol/L hydrochloric acid solution, ultrasonicate for 15 minutes and shake occasionally, cool to room temperature, dilute with iso-propanol to the volume, mix well, filter. Measure accurately 10 ml the successive filtrate to a 100 ml volumetric flask, dilute with iso-propanol-water (70 : 30) to the volume, mix well. Inject 20 μ l of the solution and record the chromatogram. Dissolve a quantity of paroxetine hydrochloride CRS equivalent to about 20 mg of paroxetine, weighed accurately, in a 250 ml volumetric flask, add 10 ml of 0.01 mol/L hydrochloric acid solution and a quantity of iso-propanol-water (70 : 30), shake well, dilute with iso-propanol-water (70 : 30) to the volume, mix well. Measure in the same manner. Calculate the content of $\text{C}_{19}\text{H}_{20}\text{FNO}_3$.

Category Antidepressant.

Strength Calculated as $\text{C}_{19}\text{H}_{20}\text{FNO}_3$
0.20 mg

Storage Preserve in tightly closed containers, protected

from light.

Pefloxacin Mesylate

$C_{17}H_{20}FN_3O_3 \cdot CH_3O_3S \cdot 2H_2O$ 465.49

Pefloxacin mesylate is 1-ethyl-6-fluoro-7-(4-methylpiperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid methanesulphonate dihydrate. It contains not less than 76.4% of $C_{17}H_{20}FN_3O_3$, calculated on the anhydrous basis.

Description A white or slight yellow crystalline powder. Freely soluble in water, very slightly soluble in ethanol, sparingly soluble in chloroform.

Identification (1) Weigh about 30 mg, add 0.2 g of sodium hydroxide and add a few droplets of water. After dissolved, vaporize slowly to dryness on an alcohol lamp and char. Add a few droplets of water and 3-4 ml of 2 mol/L hydrochloride solution and heat slowly. The vapor of sulfur dioxide is produced and change the wet potassium iodate-starch indicator paper (Immerse the paper into a mixture solution containing 5% potassium iodate solution and starch indicator solution and stand to dry) to blue.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of pefloxacin mesylate CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pefloxacin mesylate (Appendix XVI).

Acidity Dissolve a quantity in water to produce a solution of 10 mg per ml, pH 3.5-4.5.

Clarity and colour of solution To 5 portions each of 0.5 g add 5 ml water to dissolve. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B). Any colour produced (for injection) is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substances Protected from light throughout the procedure. Carry out the method described under Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the peak height of pefloxacin in the chromatogram is about 20%-25% of full scale of the chart. Dissolve a quantity of the substance being examined in water to produce a solution of 0.2 mg of pefloxacin per ml as test solution. Transfer 1 ml of test solution, measured accurately, to a 100 ml volumetric flask, dilute with water to volume and mix well as reference solution. Inject separately 20 μ l of the test solution and the reference solution respectively into column and record the chromatogram for three times the retention time of the pefloxacin peak. The sum of the areas of all peaks other than the principal peak is not greater than area of the pefloxacin peak in the chromatogram obtained with the reference solution (1.0%).

Not less than 99.0% dissolved in a mixture solution of

method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g in a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on Ignition; not more than 0.002%.

Bacteria endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.75 EU per mg of pefloxacin (for injection).

Assay Protected from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.04 mol/L potassium dihydrogen phosphate-0.05 mol/L tetrabutylammonium bromide-acetonitrile (80:8:9) as the mobile phase. Detection wavelength is 277 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of pefloxacin. The resolution factor between the peak of pefloxacin and adjacent peaks complies with the requirements.

Procedure Dissolve a quantity, accurately weighed, in the mobile phase and dilute to produce a solution of 20 μ g of pefloxacin per ml and mix well. Measure accurately 20 μ l of the solution into the column and record the chromatogram. Repeat the operation, using pefloxacin CRS instead of the substance being examined, calculate the content of $C_{17}H_{20}FN_3O_3$.

Category Quinolone antibiotic.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Pefloxacin Mesylate Tablets
(2) Pefloxacin Mesylate Injections
(3) Pefloxacin Mesylate Capsules
(4) Pefloxacin Mesylate for Injection

Pefloxacin Mesylate Capsules

Pefloxacin Mesylate Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of pefloxacin ($C_{17}H_{20}FN_3O_3$).

Description Capsules containing white or slight yellow powder.

Identification (1) Dissolve a quantity of the content in 10 ml water and filter. Evaporate a quantity of successive filtrate on a water bath to dryness. Weigh about 30 mg of residue, comply with the identification (1) of Pefloxacin Mesylate.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of pefloxacin CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L hydrochloride acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with 0.1 mol/L hydrochloride acid to produce a solution of 4 μ g of pefloxacin per ml. Dissolve a quantity of pefloxacin CRS in 0.1 mol/L hydrochloride acid solution to produce a solution of 4 μ g per ml. Measure the absorbance of the resulting solutions at 277 nm (Appendix IV A). Calculate the Not less

than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Transfer an accurately weighed quantity of the mixed contents of capsules obtained in the test for weight variation of contents, equivalent to about 100 mg of pefloxacin to a 200 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid to dissolve pefloxacin mesylate, and dilute to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well. Inject 20 μ l to the column and proceed as described under Pefloxacin Mesylate.

Category As described under Pefloxacin Mesylate

Strength Calculated as $C_{17}H_{20}FN_3O_3$
(1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Pefloxacin Mesylate for Injection

Pefloxacin Mesylate for Injection is sterile lyophilized preparation of pefloxacin mesylate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of pefloxacin ($C_{17}H_{20}FN_3O_3$).

Description A white or slight yellow lyophilized mass or powder.

Identification (1) Comply with the identification (1) of Pefloxacin Mesylate, using 30 mg.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of pefloxacin CRS.

Acidity Dissolve a quantity in water to produce a solution of 10 mg per ml, pH 3.0-4.5 (Appendix VI H).

Clarity and colour of solution To each of 5 container add 5 ml of water. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substances Carry out the method described under Pefloxacin Mesylate. Dissolve a quantity of the substance being examined, measured accurately, in water to produce a solution containing 0.2 mg of pefloxacin per ml as the test solution. Transfer 1 ml of the test solution, measured accurately, to a 100 ml volumetric flask, dilute with water to volume and mix well as the reference solution. Inject accurately 20 μ l of the test solution and the reference solution respectively into column. The sum of the areas of all peaks other than the principal peak is not greater than the area of the pefloxacin peak in the chromatogram obtained with the reference solution (1.0%).

Loss on drying When dried 6 hours at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.75 EU per mg of pefloxacin.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), transfer each portion to at least 500 ml of 0.9% sterile water, after dissolving in a

quantity of sterile water.

Other requirements Comply with the general requirements for Injections (Appendix I B).

Assay Measure accurately a quantity of the mixed contents obtained in the test for weight variation of contents. Add water to produce a solution of 20 μ g per ml of pefloxacin and proceed as described under Pefloxacin Mesylate.

Category As described under Pefloxacin Mesylate.

Strength Calculated as $C_{17}H_{20}FN_3O_3$
0.2 g

Storage Preserve in tightly closed containers, protected from light.

Pefloxacin Mesylate Injection

Pefloxacin Mesylate Injection is sterile solution of pefloxacin mesylate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of pefloxacin ($C_{17}H_{20}FN_3O_3$).

Description Clear, colourless to slight yellow or slight yellow-greenish liquid.

Identification (1) Heat 1 ml on a water bath to dryness. Complies with the Identification (1) described under Pefloxacin Mesylate, using 30 mg of the residue.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of pefloxacin CRS.

pH value 3.0-5.0 (Appendix VI H).

Colour of solution The solutions is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substances Carry out the method described under Pefloxacin Mesylate. Transfer a quantity of the substance being examined, measured accurately, in water to produce a solution of 0.2 mg of pefloxacin per ml as the test solution. Transfer 1 ml of the test solution, measured accurately, to a 100 ml volumetric flask, dilute with water to volume and mix well as the reference solution. Inject separately 20 μ l of the test solution and the reference solution respectively into column. The sum of the areas of all peaks other than the principal peak is not greater than the area of the pefloxacin peak in the chromatogram obtained with the reference solution (1.0%).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.75 EU per mg of pefloxacin.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), transfer each portion to 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Comply with the general requirements for Injections (Appendix I B).

Assay Dilute a quantity of the substance being examined with water to produce a solution of 20 μ g per ml of pefloxacin and proceed as described under Pefloxacin Mesylate.

Category As described under Pefloxacin Mesylate.

Strength Calculated as $C_{17}H_{20}FN_3O_3$
(1) 2 ml : 0.2 g (2) 5 ml : 0.4 g

Storage Preserve in well closed containers, protected from light.

Pefloxacin Mesylate Tablets

Pefloxacin Mesylate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of pefloxacin ($C_{17}H_{20}FN_3O_3$).

Description White or slight yellow tablets or film coated tablets with white or slight yellow core.

Identification (1) Dissolve a quantity of the powdered tablets in 10 ml water and filter. Evaporate a quantity of successive filtrate on a water bath to dryness. Weigh about 30 mg of residue and comply with the Identification (1) of Pefloxacin Mesylate.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of pefloxacin CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 0.1 mol/L hydrochloride acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with 0.1 mol/L hydrochloride acid solution to produce a solution of 4 μ g of pefloxacin per ml. Dissolve a quantity of pefloxacin CRS in 0.1 mol/L hydrochloride acid solution to produce a solution of 4 μ g of pefloxacin per ml. Measure the absorbance of the resulting solutions at 277 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{20}FN_3O_3$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets with coating removed. Dissolve an accurately weighed quantity of powder equivalent to about 100 mg of pefloxacin with 0.1 mol/L hydrochloride acid in a 200 ml volumetric flask and dilute to volume, mix well and filter. Measure accurately a quantity of the successive filtrate to produce a solution of 20 μ g per ml of pefloxacin as the test solution. Dissolve about 25 mg of pefloxacin CRS, weighed accurately, in 0.1 mol/L hydrochloric acid in 50 ml volumetric flask, and dilute to volume. Mix well, dilute a quantity of the solution in water to produce a solution of 20 μ g of pefloxacin per ml, as the reference solution. Proceed as described under Pefloxacin Mesylate.

Category As described under Pefloxacin Mesylate.

Strength Calculated as $C_{17}H_{20}FN_3O_3$
(1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Penfluridol

Penfluridol is 1-[4,4-bis (4-fluorophenyl) butyl]-4-[4-chloro-3-(trifluoro-methyl) phenyl]-4-piperidinol. It contains not less than 99.0% of $C_{28}H_{27}ClF_5NO$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Freely soluble in methanol, ethanol or chloroform; practically insoluble in water.

Melting point 105-108°C (Appendix VI C).

Identification (1) Dissolve 5-10 mg in 1 ml of ethanol, add 1 ml of a mixture of carbon disulfide-benzene (1 : 3) and 0.5 ml of silver nitrate TS; a pale yellow precipitate is produced which changes to greyish-black gradually.

(2) The light absorption of a 0.1 mg per ml solution in ethanol exhibits maxima at 267 and 273 nm; minima at 240 and 270 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of penfluridol (Appendix XVI).

Fluorides To 0.40 g add 50 ml of water, shake for 5 minutes and filter. Transfer 25 ml of filtrate to a 50 ml Nessler cylinder, allow to cool below 15°C, add 2.0 ml of acidic zirconyl alizarin TS, dilute with water to volume, mix well. Allow it to stand for 1 hour at a temperature below 15°C and protect from light. The colour of the solution is not more intense than that of a reference solution (dilute 4.0 ml of 0.0022% sodium fluoride solution with water to 25 ml) treated in the same manner (0.02%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-benzene-concentrated ammonia solution (8 : 3 : 2) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in ethanol containing (1) 20 mg per ml, (2) 0.20 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and then at 60°C for 15 minutes, expose to iodine vapour and examine immediately. Not more than 3 secondary spots are obtained with solution (1). Any spot, other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in 30 ml of ethanol. Carry out the method for potentiometric titration (Appendix VII A), titrate with hydrochloric acid (0.025 mol/L) VS to pH 5.1. Perform a blank determination and make any necessary correction. Each ml of hydrochloric acid (0.025 mol/L) VS is equivalent to 13.10 mg of $C_{28}H_{27}ClF_5NO$.

Category Antipsychotic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Penfluridol Tablets

Penfluridol Tablets

Penfluridol Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of penfluridol ($C_{28}H_{27}ClF_5NO$).

Description Sugar coated white tablets with a white or almost white core.

Identification (1) To a quantity of the powdered tablets equivalent to about 20 mg of penfluridol add 4 ml of ethanol, shake to dissolve penfluridol and filter. The filtrate complies with test (1) for Identification described under Penfluridol. (2) Extract a quantity of the powdered tablets equivalent to 0.1 mg of penfluridol per ml with ethanol and filter. The filtrate complies with test (2) for Identification described under Penfluridol.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Add a quantity of ethanol to 10 tablets (for 20 mg strength) or 20 tablets (for 10 mg strength) in a 50 ml volumetric flask, with sugar coating removed, shake to dissolve penfluridol, dilute with ethanol to volume and mix well. Filter, discard the initial filtrate and measure accurately 25 ml of the successive filtrate. Complete the Assay described under Penfluridol, beginning at the words "Carry out the method for potentiometric titration...". Each ml of hydrochloric acid (0.025 mol/L) VS is equivalent to 13.10 mg of $C_{28}H_{27}ClF_5NO$.

Category As described under Penfluridol.

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers.

Penicillamine

$C_5H_{11}NO_2S$ 149.21

[52-67-5]

Penicillamine is D-3-mercaptovaline. It contains not less than 95.0% of $C_5H_{11}NO_2S$, calculated on the dried basis.

Description A white or almost white crystalline powder. Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation -61.0° to -65.0° , in a solution of 50 mg per ml in 1 mol/L sodium hydroxide solution (Appendix VI E).

Identification (1) Dissolve the substance being examined and penicillamine CRS in water to produce two solutions of 2.5 mg per ml, respectively. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-glacial acetic acid-water (72 : 18 : 18) as the mobile phase. Apply separately to the plate 2 μ l each of the two solutions. After developing and removal of the plate, dry it at $105^\circ C$ for 10 minutes and expose it in iodine vapour for 5 to 10 minutes. The colour and position of the principal spot in the chromatogram obtained with the solution of substance being examined corresponds to that of the principal spot obtained with the solution of penicillamine CRS.

(2) Dissolve about 40 mg in 4 ml of water, add 2 ml of phosphotungstic acid TS (1 \rightarrow 10), allow to stand for a few minutes, a deep blue colour is produced.

(3) Dissolve about 0.5 ml in 5 ml of acetone containing 0.5 ml of hydrochloric acid. Cool in ice bath and rub the tube

wash the precipitate with acetone and dry in air. The 1% solution of precipitate in water is dextrorotatory.

Acidity An aqueous solution of 10 mg per ml, pH 4.0-6.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at $60^\circ C$, loses not more than 0.5% of its weight (Appendix VIII L).

Penicillin Carry out the method for Microbiological assay of antibiotics (Appendix XI A).

Preparation of culture medium Mix 6.0 g of peptone, 4.0 g of pancreatin digested casein, 3.0 g of yeast, 1.5 g of beef extract, 1.0 g of glucose, 15.0 g of agar and 1000 ml of water. Adjust the pH of the solution so that the final pH of the sterilized medium is 6.5-6.7. Sterilize the medium at $115^\circ C$ for 30 minutes.

Preparation of inoculum Prepare *Sarcina lutea* inoculum as directed in *Sarcina lutea* [CMCC(B)28001].

Preparation of reference solution Dilute an accurately weighed quantity of penicillin CRS with sterile phosphate BS (pH 6.0) to produce a solution of 0.02 unit per ml.

Preparation of test solution Weigh accurately 1 g to a separator, add 9 ml of water to dissolve. Add 10 ml of ether and 1 ml of phosphate BS (pH 2.5), shake for 1 minute, separate the aqueous layer to another separator, extract with 10 ml each of ether for 2 times. Combine the ether extracts, add 9 ml of water and 1 ml of phosphate BS (pH 2.5), shake for 30 seconds and discard the aqueous layer (this procedure must be completed within 6-7 minutes). Extract the ether layer with 10 ml of sterile phosphate BS (pH 6.0) for 3 minutes, separate 5 ml of the aqueous layer as test solution (1). Add 0.1 ml of penicillinase to the remaining aqueous solution and allow to stand at $36-37^\circ C$ for 1 hour as test solution (2).

Procedure Use not less 4 petri dishes, add 10 ml of culture medium to the bottom and add 5 ml of culture medium to the bacteria layer in each dish. Place 6 stainless steel cylinders, fill two of the diagonal cylinders on each plate with reference solution, test solution (1) and test solution (2) respectively, incubate the dishes at $29-30^\circ C$ for 24 hours. Measure the diameter of the inhibition zones. The mean diameter of the inhibition zone of test solution (1) is not more than the mean diameter of the inhibition zone of reference solution and no inhibition zone is produced with test solution (2) (0.2 unit/g).

Assay Dissolve about 150 mg, accurately weighed, in 100 ml of acetate BS (5.4 g of sodium acetate in a 100 ml volumetric flask, add 50 ml of water to dissolve, and adjust to pH 4.6, dilute to volume with water and mix well). Carry out the method for potentiometric titration (Appendix VII A), using platinum electrode as indicating electrode and mercury-mercurous sulfate electrode as reference electrode. Titrate slowly with mercuric nitrate (0.05 mol/L) VS, calculate the quantity of titrant at the end point by internal insertion method. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 7.461 mg of $C_5H_{11}NO_2S$.

Category Antidote of heavy metals.

Storage Preserve in tightly closed containers.

Preparation Penicillamine Tablets

Penicillamine Tablets

Penicillamine Tablets contain not less than 95.0% of

and not more than 110.0% of the labelled amount of penicillamine ($C_5H_{11}NO_2S$).

Description Sugar coated tablets with white core.

Identification Remove the sugar coating and powder the tablets. Weigh a quantity of the powder equivalent to about 250 mg of penicillamine, add 25 ml of water, stir and filter. The filtrate complies with test (1) and (2) for Identification described under Penicillamine.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.15 g of penicillamine, carry out the method for Assay described under Penicillamine.

Category As described under Penicillamine.

Strength 0.125 g

Storage Preserve in tightly closed containers.

Powdered Pentaerithrityl Tetranitrate

$C_5H_8N_4O_{12}$ 316.14

[78-11-5]

Pentaerithrityl Tetranitrate Powder is a mixture of 1 part of pentaerithrityl tetranitrate, 3 parts of lactose and 1 part of starch. It contains not less than 18.5% and not more than 21.5% of $C_5H_8N_4O_{12}$.

Description A white power; odourless.

Identification (1) Stir a quantity equivalent to about 50 mg of pentaerithrityl tetranitrate with 25 ml of dehydrated acetone (dry acetone with anhydrous sodium carbonate and distil) to dissolve pentaerithrityl tetranitrate, and filter. Transfer the filtrate to an evaporating dish, expel acetone on a warm water bath. The residue melt at 139-143°C (Appendix VI C) (pentaerithrityl tetranitrate has explosive property, suitable protective mask should be used in operation. Dissolve the remaining residue in acetone, dispose by burning in a porcelain dish).

(2) Transfer about 10 mg of the residue obtained from test (1) to a mixture of 3 ml of sulfuric acid and 1 ml of water, cool, add 3 ml of ferrous sulfate TS along the wall of test tube, a brown ring is produced at the junction of the liquids.

Assay Reference solution Dissolve 127.9 mg of potassium nitrate previously dried to constant weight at 105°C, accurately weighed, in a 200 ml volumetric flask with 3 ml of water, dilute with glacial acetic acid to volume and mix well. Measure accurately 5 ml of the solution to a 10 ml volumetric flask, dilute with glacial acetic acid to volume and mix well (each ml is equivalent to 0.25 mg of $C_5H_8N_4O_{12}$).

Test solution Weigh accurately a quantity equivalent to about 25 mg of pentaerithrityl tetranitrate to a 100 ml volumetric flask, add 75 ml of glacial acetic acid, heat on a water bath for 20 minutes, cool, add glacial acetic acid to volume, mix well and filter, using the filtrate.

Procedure Transfer 2 ml each of the two solutions, accurately measured, to two 50 ml volumetric flasks separately. Add accurately 2 ml of phenoldisulfonic acid TS

25 ml of water and cool, then add gradually 8 ml of concentrated ammonia solution to alkalinize the solution, cool to room temperature, add water to volume and mix well. Measure the absorbance of the resulting solutions at 405 nm (Appendix IV A). Calculate the content of $C_5H_8N_4O_{12}$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light, stored in a cool place.

Preparation Pentaerithrityl Tetranitrate Tablets

Pentaerithrityl Tetranitrate Tablets

Pentaerithrityl Tetranitrate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of pentaerithrityl tetranitrate ($C_5H_8N_4O_{12}$).

Description White tablets.

Identification (1) Stir a quantity of the powdered tablets equivalent to about 50 mg of pentaerithrityl tetranitrate with about 25 ml of dehydrated acetone (dry acetone with anhydrous sodium carbonate and distil), and filter. Transfer the filtrate to an evaporating dish, expel acetone on a warm water bath. The residue melt at 139-143°C (Appendix VI C) (pentaerithrityl tetranitrate has explosive property, suitable protective mask should be used in operation. Dissolve the remaining residue in acetone, dispose by burning in a porcelain dish).

(2) Transfer about 10 mg of the residue obtained from test (1) to a mixture of 3 ml of sulfuric acid and 1 ml of water, cool, add 3 ml of ferrous sulfate TS along the wall of test tube, a brown ring is produced at the junction of the liquids.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with glacial acetic acid in a mortar, transfer to a 50 ml volumetric flask with glacial acetic acid in portions under a ventilation hood. Heat on a water bath for about 20 minutes, shake to dissolve pentaerithrityl tetranitrate and cool, dilute to volume and mix well. Filter, use the successive filtrate as test solution, carry out the Assay as described under Powdered Pentaerithrityl Tetranitrate. Calculate the content of $C_5H_8N_4O_{12}$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Triturate an accurately weighed quantity of the powder equivalent to about 25 mg of pentaerithrityl tetranitrate to a 100 ml volumetric flask. Add about 75 ml of glacial acetic acid, heat on a water bath for 20 minutes, allow to cool, add glacial acetic acid to volume. Use the successive filtrate as test solution, carry out the Assay described under Powdered Pentaerithrityl Tetranitrate, calculate the content of $C_5H_8N_4O_{12}$.

Category, Storage As described under Powdered Pentaerithrityl Tetranitrate.

Strength 10 mg

Pentagastrin

$C_{37}H_{49}N_7O_9S$ 767.9

[5534-95-2]

Pentagastrin is *N*-Carboxy- β -alaninyl-L-tryptophyl-L-methionyl-L-aspartylphenyl-L-alaninamide-*N*-

and not more than 103.0% of $C_{37}H_{49}N_7O_9S$, calculated on the dried basis.

Description A white or almost white powder; odourless. Soluble in dimethylformamide; slightly soluble in ethanol; insoluble in water; soluble in dilute ammonia solution.

Specific optical rotation -25.0° to -29.0° , in a solution of 10 mg per ml in dimethylformamide (Appendix VI E).

Identification (1) The light absorption of the solution obtained in the Assay, in the range of 230-350 nm (Appendix IV A), exhibits two maxima at 280 nm and 288 nm, and an inflection at 275 nm.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica G as the coating substance and the upper layer of a mixture of butanol-water-isobutyric acid-glacial acetic acid (50 : 50 : 5 : 7) as the mobile phase. Apply separately to the plate 3 μ l each of the following solutions. For solution (1) shake about 5 mg of pentagastrin with 0.5 ml of hydrochloride acid solution (1 \rightarrow 2), transfer to an ampoule, seal and hydrolysis at 150°C for 30 minutes. Transfer the hydrolysate to a small beaker, evaporate to dryness on a water bath, dissolve the residue in 0.1 ml of water as test solution. Solution (2) contains 2.5 mg of methionine CRS per ml in water. Solution (3) contains 2.5 mg of tryptophan CRS per ml in water. Solution (4) contains 2.5 mg of phenylalanine CRS per ml in water. Solution (5) contains 2.5 mg of aspartic acid CRS per ml in water. Solution (6) contains 2.5 mg of β -alanine CRS in water. Solution (7) contains the same concentration of each of the reference substances specified in solution (2) to solution (6). Develop the plate for three times in one direction. During each development allow the mobile phase to ascend about 15 cm above the line of application, dry the plate in the air and develop again in the same manner with the developing path being slightly longer than the previous. After developing and removal of the plate, dry in air, spray with ninhydrin TS (To 0.1 g of ninhydrin add 0.2 ml of water, 0.4 ml of glacial acetic acid, 1 ml of trimethylpyridine and a quantity of ethanol to 20 ml) and heat at 70-80°C for 15 minutes. There are five spots in the chromatogram obtained with solution (7). The colour and position of the spots in the chromatogram obtained with solution (1) correspond to the principal spots obtained with solution (2) to solution (6).

Absorbance ratio Measure the light absorption of solution obtained in the assay and the ratio of the absorbance at 280 nm to that at 288 nm is 1.12-1.22.

Loss on drying When dried in vacuum over phosphorous pentoxide for 24 hours, loses not more than 0.5% of its weight (Appendix VIII L).

The relative proportions of the amino acids To a quantity of pentagastrin add a quantity of hydrochloride acid solution (1 \rightarrow 2), hydrolysis at 110°C for 24 hours, determine hydrolysate by means of an amino-acid autoanalyzer, the relative proportions of amino acids is 1.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ether-glacial acetic acid-water (10 : 2 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in a mixture of methanol-concentrated ammonia solution (24 : 1) containing (1) 5 mg per ml (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, allow it to dry in air, heat at 100°C for 2 minutes, spray with *p*-dimethylaminobenzaldehyde solution (Dissolve 1 g of *p*-dimethylaminobenzaldehyde in a quantity of a mixture of methanol-hydrochloric acid (3 : 1)) and heat at 100°C until

chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (2.0%).

Assay Dissolve an accurately weighed quantity of pentagastrin in 0.01 mol/L ammonia solution to produce a solution of about 50 μ g per ml, measure the absorbance at 280 nm (Appendix IV A). Calculate the content of $C_{37}H_{49}N_7O_9S$, taking 70 as the value of A (1%, 1 cm).

Category Diagnostic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Pentagastrin Injection

Pentagastrin Injection

Pentagastrin Injection is a sterile solution of Pentagastrin in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of pentagastrin ($C_{37}H_{49}N_7O_9S$).

Description A clear, colourless liquid.

Identification Complies with the tests for Identification described under pentagastrin.

pH value 7.0-8.0 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ether-glacial acetic acid-water (10 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in water containing (1) 0.25 mg per ml and (2) 50 μ g per ml of the substance being examined. Carry out the procedure as described under Pentagastrin beginning at the words "After developing and removal of the plate...".

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1.5 ml of a solution of 250 μ g per ml in Water for Injections per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity of the test solution equivalent to about 0.75 mg of pentagastrin with 0.01 mol/L ammonia solution to produce a solution of about 50 μ g per ml. Carry out the procedure as described under Pentagastrin. Calculate the content of $C_{37}H_{49}N_7O_9S$.

Category As described under Pentagastrin.

Strength 2 ml : 400 μ g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Pentetate Acid and Stannous Chloride for Injection

Pentetate Acid and Stannous Chloride for Injection is a sterile, lyophilized mixture of pentetate acid, stannous chloride and sodium chloride. It contains not less than 90.0% and not more than 110.0% of the labelled amount of pentetate acid ($C_{14}H_{23}N_3O_{10}$).

Description A white lyophilized powder.

Identification (1) To 10 ml of water, add one drop each of ferric chloride TS and ammonium thiocyanate TS, mix well, a red solution is obtained. Apply 2 ml of the solution to the substance being examined, the red colour disappears.

(2) Dissolve the content of one container in 0.5 ml of Sodium Chloride Injection, apply one drop of the solution to a strip of ammonium phosphomolybdate TP, a blue colour is produced.

Clarity and colour of solution Dissolve the content of one container in 5 ml of Sodium Chloride Injection, the solution is clear and colourless.

Stannous ion Dissolve the content of each of 5 containers separately in 3 ml of 1 mol/L hydrochloric acid solution saturated with nitrogen. Carry out the method for potentiometric titration (Appendix VII A) under a current of nitrogen, titrate with potassium iodate (0.001667 mol/L) VS. Not less than 0.02 ml is consumed for each container. Repeat the test with another 5 containers if one of them fails, all the containers in the second test must comply with the requirement.

Acidity or alkalinity pH 4.0–7.5 (Appendix VI H), using the solution obtained in the test for Clarity and colour of solution.

Bacterial endotoxin Dissolve each container in 5 ml of water BET and dilute with water BET to at least 30 times. Carry out the test for bacterial endotoxin (Appendix XI E); less than 75 EU per container.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the content of each of 20 containers separately in 5 ml of water, combine all the solutions to a 250 ml conical flask, add 10 ml of ammonia-ammonium chloride buffer solution (to 20 g of ammonium chloride add 72 ml of concentrated ammonia solution, dilute with water to 1000 ml), mix well. Add a quantity of eriochrome black T IS, titrate with Zinc (0.05 mol/L) VS until a purplish red colour is obtained. Each ml of Zinc (0.05 mol/L) VS is equivalent to 19.67 mg of $C_{14}H_{23}N_4O_3$.

Category Used for the preparation of Technetium [^{99m}Tc] Pentetate Injection.

Strength 2.1 mg of pentetate acid and 0.13 mg stannous chloride dihydrate ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$)

Storage Preserved in tightly closed containers, stored in a dark place at 2–8°C.

Pentoxifylline

$C_{13}H_{18}N_4O_3$ 278.31

[6493-05-6]

Pentoxifylline is 3,7-dihydro-3,7-dimethyl-1-(5-oxohexyl)-1*H*-purine-2,6-dione. It contains not less than 97.0% and not more than 103.0% of $C_{13}H_{18}N_4O_3$, calculated on the dried basis.

Description A white powder or granules; odour, slightly characteristic; taste, bitter.

Freely soluble in chloroform; soluble in water, ethanol or benzene; slightly soluble in ether.

Identification (1) To 10 mg add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate on a water bath to dryness, the residue reacts with ammonia vapour to produce a purple colour, which disappears on the addition of a few drops of sodium hydroxide TS.

(2) Dissolve 10 mg in 5 ml of water, add 1 ml of dilute sulfuric acid, and then add a few drops of iodine TS, a brown precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pentoxifylline (Appendix XVI).

Clarity of benzene solution Dissolve 0.5 g in 1 ml of benzene in a dry test tube, warm gently in a water bath to dissolve pentoxifylline, the solution is clear.

Bromides Dissolve 0.50 g in 10 ml of water, add 0.5 ml of dilute nitric acid and 1 ml of silver nitrate TS, heat to boil, cool and dilute with water to 25 ml, mix well, the colour and turbidity produced is not more intense than that of a reference solution, using 11.0 ml of potassium bromide standard solution (0.01 mg Br per ml) prepared in same manner.

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 2 ml of dilute acetic acid and a quantity of water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve an accurately weighed quantity in water to produce a solution of 10 µg per ml, measure the absorbance at 274 nm (Appendix IV A), calculate the content of $C_{13}H_{18}N_4O_3$, taking 365 as the value of *A* (1%, 1 cm).

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Pentoxifylline Enteric-coated Tablets
(2) Pentoxifylline Injection
(3) Pentoxifylline Sustained-release Tablets

Pentoxifylline Enteric-Coated Tablets

Pentoxifylline Enteric-Coated Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Description Enteric-coated tablets with white core.

Identification To a quantity of pulverized tablets equivalent to 50 mg of pentoxifylline add 10 ml of chloroform, shake thoroughly, filter and evaporate the filtrate on a water bath to dryness, the residue complies with tests (1) and (2) for Identification described under Pentoxifylline.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with enteric-coated film removed. Dissolve a quantity of the powder equivalent to 0.1 g of pentoxifylline, accurately weighed, in a 100 ml volumetric flask with 70 ml of water, keep warm in a water bath and shake, cool, dilute with water to volume, mix well and filter. Discard the initial filtrate, measure accurately a quantity of successive filtrate, dilute with water to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 274 nm (Appendix IV A), calculate the content of $C_{13}H_{18}N_4O_3$, taking 365 as the value of *A* (1%, 1 cm).

Category, Storage As described under Pentoxifylline.

Strength 0.1 g

Pentoxifylline Injection

Pentoxifylline Injection is a sterile solution of pentoxifylline in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Description A clear, colourless liquid.

Identification (1) To a quantity equivalent to about 10 mg of pentoxifylline add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate to dryness on a water bath. The residue reacts with ammonia vapour to produce a purple colour, which disappears on the addition of a few drops of sodium hydroxide TS.

(2) Dilute a quantity equivalent to about 10 mg of pentoxifylline with 5 ml of water, add 1 ml of dilute sulfuric acid, and a few drops of iodine TS; a brown precipitate is produced.

(3) The light absorption of the solution obtained in Assay exhibits a maximum at 274 nm and a minimum at 246 nm.

pH value 4.0-6.5 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 20 mg per kg of rabbit's weight, injected slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity with water to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 274 nm (Appendix IV A), calculate the content of $C_{13}H_{18}N_4O_3$, taking 365 as the value of A (1%, 1 cm).

Category As described under pentoxifylline.

Storage Preserve in well closed containers, protected from light.

Strength (1) 2 ml : 0.1 g (2) 5 ml : 0.1 g

Pentoxifylline Sustained-release Tablets

Pentoxifylline Sustained-release Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Description Film coated tablets with white or almost white core.

Identification To a quantity of powdered tablets with coating removed (equivalent to about 50 mg of pentoxifylline), add 10 ml of chloroform, shake and centrifuge, evaporate the chloroform solution to dryness. The residue complies with tests for identification (1), (2) described under Pentoxifylline.

Drug release Carry out the method for dissolution test (Appendix X D, method 1), using the apparatus described under Dissolution test (Appendix X C, method 2) and 900 ml of hydrochloric acid solution (9 → 1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw 10 ml of the solution at exact 2, 6, 12 and 16 hours respectively, filter and supply 10 ml of the

medium accordingly to the vessel immediately. Transfer separately 3 ml, 1 ml, 1 ml and 1 ml of the successive filtrate to different 25 ml volumetric flask, accurately measured, and dilute with the dissolution medium to volume and mix well. Measure the absorbance of the resulting solutions at 274 nm (Appendix IV A), calculate the content of $C_{13}H_{18}N_4O_3$ dissolved from each tablet at 2, 6, 12 and 16 hours separately, taking 351 as the value of A (1%, 1 cm). The dissolution of pentoxifylline complies with the requirement; the quantity dissolved of each tablet is not less than 10%-30%, 30%-55%, 50%-85% and over 75% of the labelled amount of $C_{13}H_{18}N_4O_3$ at 2, 6, 12 and 16 hours respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets with film coating removed. Triturate an accurately weighed quantity of powder equivalent to about 0.4 g of pentoxifylline into a 200 ml volumetric flask, add 100 ml of water. Keep the temperature in a warm water bath with constant shaking to dissolve pentoxifylline, cool to room temperature, dilute with water to volume and shake well. Filter and measure accurately a quantity of the successive filtrate and dilute with water to produce a solution of 10 µg per ml. Measure the absorbance of the solution at 274 nm (Appendix IV A). Calculate the content of $C_{13}H_{18}N_4O_3$, taking 365 as the value of A (1%, 1 cm).

Category As described under Pentoxifylline.

Strength 0.4 g

Storage Preserve in tightly closed containers, protected from light.

Pentoxifyverine Citrate

$C_{20}H_{31}NO_3 \cdot C_6H_8O_7$ 525.60

[23142-01-0]

Pentoxifyverine Citrate is 2-(2-Diethylaminoethoxy) ethyl-1-phenylcyclopentane-1-carboxylate citrate. It contains not less than 98.5% of $C_{20}H_{31}NO_3 \cdot C_6H_8O_7$, calculated on the dried basis.

Description A white or almost white crystalline powder or granule; odourless; taste; bitter. Freely soluble in water; soluble in ethanol; sparingly soluble in chloroform; practically insoluble in ether.

Melting range 88-93°C (Appendix VI C).

Determined in a capillary tube sealed under reduced pressure.

Identification (1) Dissolve about 20 mg in 2 ml of water, add 4 drops of dilute hydrochloric acid and a few drops of potassium ferrocyanide TS, a yellowish-white precipitate is produced.

(2) Dissolve about 20 mg in 10 ml of water, add 2 drops of dilute hydrochloric acid and a few drops of potassium dichromate TS, a yellow precipitate is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pentoxifyverine citrate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic

of citrates (Appendix III).

Clarity of solution Dissolve with shaking 0.5 g in 5 ml of water. Any opalescence produced is not more pronounced than that of reference suspension III (Appendix IX B).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrate ammonia solution (27 : 2.5 : 0.6) as the mobile phase. Apply separately to the plate 5 μ l of each of two solutions in ethanol containing (1) 30 mg per ml, (2) 0.3 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, spray with potassium iodobismuthate TS and examine immediately. Not more than 3 secondary spots are obtained with solution (1). Any spot, other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2) using the residue obtained in Residue on ignition; not more than 0.0015%.

Assay Dissolve about 0.4 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml perchloric acid (0.1 mol/L) VS is equivalent to 52.56 mg of $C_{20}H_{31}NO_3 \cdot C_6H_8O_7$.

Category Antitussive.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Pentoxyverine Citrate Pills
(2) Pentoxyverine Citrate Tablets

Pentoxyverine Citrate Pills

Pentoxyverine Citrate Pills contain not less than 90.0% and not more than 110.0% of the labelled amount of pentoxyverine citrate ($C_{20}H_{31}NO_3 \cdot C_6H_8O_7$).

Description White pills.

Identification Add 5 ml of water to 4 pills, heat gently to dissolve pentoxyverine citrate, cool and filter, the filtrate complies with the tests for Identification (1), (2), (4) described under Pentoxyverine Citrate.

Other requirements Comply with the general requirements for pills (Appendix I H) except that the disintegration time is within 60 minutes.

Assay Dissolve 10 pills in 20 ml of chloroform, add 10 ml of glacial acetic acid and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution turns to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 52.56 mg of $C_{20}H_{31}NO_3 \cdot C_6H_8O_7$.

Category As described under Pentoxyverine Citrate.

Strength 25 mg

dry place.

Pentoxyverine Citrate Tablets

Pentoxyverine Citrate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of pentoxyverine citrate ($C_{20}H_{31}NO_3 \cdot C_6H_8O_7$).

Description Sugar coated tablets with white core.

Identification (1) Remove the coating, powder finely and to a quantity equivalent to about 0.10 g of pentoxyverine citrate add 50 ml of water to dissolve pentoxyverine citrate, filter. The filtrate complies with test (1), (2) for Identification described under Pentoxyverine Citrate. (2) The fine powder yields the reaction characteristic of citrate (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Remove the coating of 50 tablets and weigh accurately. Powder finely and weigh accurately a quantity equivalent to about 0.5 g of pentoxyverine citrate to a separator, add 15 ml of water, shake to dissolve pentoxyverine citrate, add 3 ml of 20% sodium hydroxide solution and mix well. Extract with 50 ml of chloroform, measured accurately, shake for 15 minutes and allow to stand. Separate the chloroform layer and filter through a piece of dry filter paper. Discard the initial filtrate and measure accurately 25 ml of the successive filtrate to a conical flask. Add 20 ml of glacial acetic acid, 3 ml of acetic anhydride and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 52.56 mg of $C_{20}H_{31}NO_3 \cdot C_6H_8O_7$.

Category As described under Pentoxyverine Citrate.

Strength 25 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Pepsin

Pepsin is a protease extracted from the gastric mucosa of pigs, sheep or cattle. It contains not less than 3800 Units per g.

Description A white to slight yellow powder; odour, slight but moldy; hygroscopic. The aqueous solution exhibits acidic reaction.

Identification To aqueous solution add the solutions of tannic acid, gallic acid or heavy metals salts, a precipitate is produced.

Loss on drying When dried at 100°C for 4 hours, loses not more than 5.0% of weight (Appendix VIII L).

Assay Reference solution Weigh accurately a quantity of tyrosine, add hydrochloric acid solution [dilute 65 ml of 1 mol/L hydrochloric acid solution with water to produce 1000 ml] to produce a solution of about 0.5 mg per ml.

Test solution Weigh accurately a quantity of the substance being examined, add the above hydrochloric acid solution to produce a solution of about 0.2-0.4 Units per ml.

Procedure Add accurately 1 ml of the reference solution to each of three test tubes and add accurately 1 ml of test solution to each of another three test tubes. Place the six test tubes in a water bath maintained at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ for 5 minutes, then to each add accurately 5 ml of hemoglobin TS, previously heated to $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$, mix well and allow the reaction to proceed in a $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ water bath for exactly 10 minutes. Add immediately 5 ml of 5% trichloroacetic acid solution and mix well. Filter, and collect the successive filtrate for use. To each of another two test tubes add accurately 5 ml of hemoglobin TS, place the two test tubes in a water bath maintained at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ for 10 minutes, then to each tube add accurately 5 ml of 5% trichloroacetic acid solution. Add 1 ml of test solution to one test tube and add 1 ml of above mentioned diluted hydrochloric acid solution to another test tube, mix well, filter, use the successive filtrates separately as the blanks for test solution and reference solution respectively. Measure the absorbances of resulting solutions at 275 nm (Appendix IV A). Calculate the protease activity as follows:

$$\text{Units of protease activity per g} = \frac{\bar{A} \times W_s \times n}{\bar{A}_s \times W \times 10 \times 181.19}$$

Where \bar{A} is the average absorbance of test solution;
 \bar{A}_s is average absorbance of reference solution;
 W_s is the quantity of tyrosine (μg) in 1 ml of reference solution;
 W is the weight of substance being examined (g);
 n is the dilution factor.

One Unit of protease activity is defined as the amount of protease which hydrolyzed hemoglobin to produce 1 μmol of tyrosine per minute under the specified conditions.

Category Digestant.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Saccharated Pepsin (2) Pepsin Granules (3) Pepsin Tablets

Pepsin Granules

Pepsin Granules contains not less than 480 Units of pepsin activity.

Description Almost white to yellow granules; odour, characteristic of fruit; taste, sweet; hygroscopic.

Identification Triturate a quantity with water to dissolve pepsin and filter, the filtrate complies with the test for Identification described under Pepsin.

Acidity Dissolve 1 g in 20 ml of water, pH 3.0-4.0 (Appendix VI H).

Loss on drying When dried at 100°C for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Microbial limit Comply with the test for microbial limit described under Pepsin Tablets.

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 240 Units of pepsin, accurately weighed, in hydrochloric acid solution (as described under Pepsin) to produce a solution of about 0.2-0.4 Units per ml, as the test solution, carry out the Assay described under Pepsin.

Category As described under Pepsin.

Strength 480 Units

Storage Preserve in tightly closed containers, stored in a dry place.

Pepsin Tablets

Pepsin Tablets contains not less than 120 Units of pepsin activity.

Description Sugar-coated tablets with slight yellow core.

Identification Triturate a quantity with water to dissolve pepsin and filter, the filtrate complies with the test for Identification described under Pepsin.

Microbial limit Comply with test for microbial limit (Appendix XI J), except that number of bacterial is not more than 5000 and that of fungus is not more than 100 per g.

Other requirements Comply with the general requirements for tablets (Appendix I H) except that the disintegration time is within 30 minutes.

Assay Triturate 5 tablets with a small quantity of hydrochloric acid solution (as described under Pepsin) in a mortar, transfer to a 250 ml volumetric flask, add the above hydrochloric acid solution to volume and mix well. Dilute a quantity of the resulting solution, accurately measured, with the above hydrochloric acid solution to produce a solution of 0.2-0.4 Units per ml as the test solution, carry out the Assay described under Pepsin.

Category As described under Pepsin.

Strength 120 Units

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Saccharated Pepsin

Saccharated Pepsin is obtained by diluting pepsin with lactose, glucose or sucrose. It contains not less than 120 or 1200 Units of pepsin activity per g.

Description A white to pale yellow powder; taste, sweet; odour, not moldy; hygroscopic. The aqueous solution exhibits acidic reaction.

Identification The aqueous solution complies with the test for Identification described under Pepsin.

Loss on drying When dried at 100°C for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Microbial limit Complies with the test for Microbial limit described under Pepsin Tablets.

Assay Carry out the Assay described under Pepsin.

Category As described under Pepsin

Strength (1) 1 g : 120 Units (2) 1 g : 1200 Units

Storage Preserve in tightly closed containers, stored in a dry place.

Perphenazine

$C_{21}H_{26}ClN_3OS$ 403.97

[58-39-9]

Perphenazine is 4-[3-(2-chloro-10*H*-phenothiazin-10-yl)propyl]-1-piperazineethanol. It contains not less than 98.5% of $C_{21}H_{26}ClN_3OS$, calculated on the dried basis.

Description A white to pale yellow crystalline powder; almost odourless; taste, slight bitter.

Very soluble in chloroform; soluble in ethanol; practically insoluble in water; soluble in dilute hydrochloric acid.

Melting range 94-100°C (Appendix VI C).

Identification (1) Heat 5 mg in 1 ml of hydrochloric acid and 1 ml of water to 80°C, add a few drops of hydrogen peroxide TS; a deep red colour is produced, fading gradually on standing.

(2) The light absorption of a solution of 7 µg per ml in dehydrated ethanol exhibits a maximum at 258 nm. The absorbance is about 0.65 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of perphenazine (Appendix XVI).

Clarity and colour of methanol solution Dissolve 0.20 g in 10 ml of methanol, the solution is clear; any colour produced is not more intense than that of a reference solution Y_2 (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Dissolve an accurately weighed quantity in ethanol to produce a solution of 5 mg per ml as the test solution. Measure accurately a quantity of the test solution, add ethanol to produce three reference solutions containing (1) 0.075 mg per ml, (2) 0.05 mg per ml and (3) 0.025 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-butanol-water-concentrated ammonia TS (85 : 14 : 1) as the mobile phase. Apply separately to the same plate 10 µl each of the above four solutions. After developing (allow the mobile phase ascends 15 cm above the line of application) and removal of the plate, dry in air and examine under ultraviolet light (254 nm). The total related substance other than the principal spot obtained in the chromatogram of the test solution are not greater than 3.0% in comparison with the principal spot in the chromatograms of the reference solution (1), (2) and (3), respectively.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid

Category Antipsychotic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Perphenazine Injection
(2) Perphenazine Tablets

Perphenazine Injection

Perphenazine Injection is a sterile solution of Perphenazine in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of perphenazine ($C_{21}H_{26}ClN_3OS$).

Description A clear, colourless to slight yellow liquid.

Identification (1) Heat 1 ml with 1 ml of hydrochloric acid and 1 ml of water to 80°C, add a few drops of hydrogen peroxide solution, a deep red colour is produced, fading gradually on standing.

(2) Evaporate 1 ml in an evaporating dish on a water bath to dryness, allow to cool. Dissolve the residue in 5 ml of sulfuric acid, a cherry red colour is produced, turning to deep red on standing. Heat a part of the sulfuric acid solution, it changes to fuchsin colour. Add a few drops of 0.1 mol/L potassium dichromate solution to another part of the sulfuric acid solution, the colour changes to deep red, then reddish brown finally to brownish green.

pH value 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To an accurately measured quantity of the injection, equivalent to about 125 mg of perphenazine into a separator add 2 ml of sodium hydroxide TS to make alkaline. Extract with each 20 ml of chloroform for 4 times, combine the extracts, filter with dry filter paper containing 5 g of anhydrous sodium sulfate. Evaporate the filtrate on water bath to dryness. Dissolve the residue in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.20 mg of $C_{21}H_{26}ClN_3OS$.

Category As described under perphenazine.

Strength 1 ml : 5 mg

Storage Preserve in well closed containers, protected from light.

Perphenazine Tablets

Perphenazine Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of perphenazine ($C_{21}H_{26}ClN_3OS$).

Description Sugar-coated or film coated tablets with white core.

Identification Shake a quantity of the powdered tablets equivalent to about 5 mg of perphenazine with 2 ml of chloroform, filter and evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Perphenazine.

(2) Protect from light throughout the operation. The light

exhibits a maximum at 258 nm (Appendix IV A).

Related substances Protect from light throughout the procedure. Pulverize some tablets removed the coating and weigh accurately a quantity of the powdered tablets equivalent to about 20 mg of perphenazine. Triturate it with ethanol and transfer to a 10 ml volumetric flask, shake thoroughly and add ethanol to volume, mix well and filter. The successive filtrate is used as the test solution. Measure accurately various quantities to produce four reference solutions in ethanol containing (1) 0.1 mg per ml, (2) 0.075 mg per ml, (3) 0.05 mg per ml and (4) 0.025 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-butanol-water-concentrated ammonia TS (85 : 14 : 1) as the mobile phase. Apply separately to the same plate 25 μ l each of above five solutions. After developing (allow the mobile phase ascends 15 cm above the line of application), remove the plate and dry in air, examine under ultraviolet light (254 nm). The total related substances other than the principal spot in the chromatogram of the obtained test solution is not greater than 3.5% in comparison with the principal spot in the chromatograms of four reference solutions.

Content uniformity Protect from light throughout the procedure. Comply with the requirements (Appendix X E). Grind finely 1 tablet in a mortar, with sugar coating removed, then moisten with 5 drops of water, add a quantity of hydrochloride acid-ethanol solution [To 500 ml of ethanol add 10 ml of hydrochloride acid, dilute it with water to 1000 ml, mix well] and mix well. Transfer the mixture to a 50 ml volumetric flask with a quantity of hydrochloride acid-ethanol solution, shake thoroughly to dissolve perphenazine, add hydrochloride acid-ethanol solution to volume, mix well. Filter, measure accurately a quantity of the successive filtrate and add hydrochloride acid-ethanol solution to produce a solution of 4 μ g per ml, as the test solution. Dissolve an accurately weighed quantity of perphenazine CRS in the hydrochloride acid-ethanol solution to produce a solution of 4 μ g per ml as reference solution. Measure the absorbances of the solutions at 258 nm (Appendix IV A), calculate the content of C₂₁H₂₆ClN₃OS.

Dissolution Protect from light throughout the procedure. Comply with dissolution test (Appendix X C, method 2), using 500 ml (in case of 4 mg/tablet is tested, using 1000 ml) of 0.3% solution of polysorbate-80 as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw some solution after exactly 45 minutes and filter. The successive filtrate is used as test solution. Dissolve an accurately weighed quantity of perphenazine CRS in dehydrated ethanol to produce a solution of 0.4 mg per ml, measure accurately 5 ml to 500 ml volumetric flask and add dissolution medium to volume, mix well and filter, the successive filtrate is used as reference solution. Measure separately absorbances of the above two solutions at 259 nm (Appendix IV A). Calculate the dissolution of C₂₁H₂₆ClN₃OS from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder 20 tablets with sugar coating removed. Transfer an accurately weighed quantity of the powdered tablets equivalent to about 10 mg of perphenazine to a 100 ml volumetric flask, add about 70 ml of hydrochloride acid-ethanol solution. Shake thoroughly to dissolve perphenazine, dilute with above solution to volume, mix well and filter. Measure accurately 5 ml of the successive

ethanol solution to volume, mix well, the resulting solution is used as test solution. Dissolve an accurately weighed quantity of perphenazine CRS in the hydrochloride acid-ethanol solution to produce a solution of 5 μ g per ml as reference solution. Measure separately the absorbances of above two solutions at 258 nm (Appendix IV A). Calculate the content of C₂₁H₂₆ClN₃OS.

Category As described under Perphenazine.

Strength (1) 2 mg (2) 4 mg

Storage Preserve in tightly closed containers, protected from light.

Pethidine Hydrochloride

C₁₅H₂₁NO₂ · HCl 283.80

[50-13-5]

Pethidine Hydrochloride is 1-methyl-4-phenyl-4-piperidinecarboxylic acid ethyl ester hydrochloride. It contains not less than 99.0% of C₁₅H₂₁NO₂ · HCl, calculated on the dried basis.

Description A white crystalline powder; odourless or almost odourless.

Freely soluble in water or ethanol; soluble in chloroform; practically insoluble in ether.

Melting range 186-190°C (Appendix VI C).

Identification (1) Dissolve 50 mg in 5 ml of ethanol, add 5 ml of trinitrophenol ethanolic solution (1→30) and shake; a yellow crystalline precipitate is produced. Allow to stand, filter, wash the precipitate with water and dry at 105°C for 2 hours. It melts at 188-191°C (Appendix VI C).

(2) Dissolve 50 mg in 5 ml of water, add 2 ml of sodium carbonate TS, shake; oily droplets are produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pethidine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.30 g in 10 ml of water, pH 4.5-5.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.10 g in 5 ml of water is clear and almost colourless.

Related substances Weigh about 1.0 g to a separator, add 5 ml of sodium hydroxide TS and 10 ml of ether, shake and allow to stand. Discard the aqueous layer and evaporate the ether extract to dryness at room temperature. Dissolve the residue in 2 ml of ethanol as the test solution. Measure accurately 0.5 ml to a 50 ml volumetric flask, dilute with ethanol to volume and mix well as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using kieselguhr G as the coating substance with phenoxetol as the stationary phase [preparation: develop the plate coated with kieselguhr G in the mobile phase of acetone-phenoxetol (9 : 1). The mobile phase ascends a three fourths of the distance, remove the plate and dry in air].

diethylamine (100 : 8 : 1) to a separator, shake and allow to separate, use the supernatant liquid as the mobile phase. Apply separately to the same plate 5 μ l each of the above two solutions, after developing and removal of the plate, dry in air, spray with 0.2% dichlorofluorescein solution in methanol, allow it to dry in air and examine immediately under ultraviolet light (365 nm). Any spot, other than the principal spot in the chromatogram, obtained with the test solution is not more than two spots and not more intense than the principal spot obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.25 g, accurately weighed, in 10 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.38 mg of $C_{15}H_{21}NO_2 \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed containers.

Preparation (1) Pethidine Hydrochloride Injection
(2) Pethidine Hydrochloride Tablets

Pethidine Hydrochloride Injection

Pethidine Hydrochloride Injection is a sterile solution of Pethidine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of pethidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).

Description A clear and colourless liquid.

Identification (1) Dilute 1 ml with water to 5 ml, add 2 ml of sodium carbonate TS, shake, oily droplets are produced. Extract the oily droplets twice with ether, each of 10 ml, combine the ether extracts and filter. Add 5 drops of hydrochloric acid to the filtrate, evaporate the ether. The residue when dried at 105°C for 1 hour, melts at 182-187°C (Appendix VI C).

(2) Yields the reactions characteristic of chlorides (Appendix III).

pH value 4.0-6.0 (Appendix VI H).

Related substances Carry out the test for Related substances described under Pethidine hydrochloride, using 2 ml, beginning at the words "to a separator...". The results comply with the requirements.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml of pethidine hydrochloride injection, add 10 ml of water and 3 ml of sodium hydroxide TS and mix well. Extract five times with chloroform (20 ml, 20 ml, 20 ml, 20 ml, 10 ml) and wash the combined extracts with 10 ml of water. Extract the washing with 10 ml chloroform, combine all of the extracts and filter through anhydrous sodium sulfate into conical flask. Wash the anhydrous sodium sulfate with 5 ml of chloroform and combine the washing to the filtrate. Evaporate the filtrate to dryness under vacuum, add 10 ml of glacial acetic acid and 1 ml of crystal violet TS, titrate with perchloric acid (0.1

a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.38 mg of $C_{15}H_{21}NO_2 \cdot HCl$.

Category As described under Pethidine Hydrochloride.

Strength (1) 1 ml : 50 mg (2) 2 ml : 100 mg

Storage Preserve in tightly closed containers.

Pethidine Hydrochloride Tablets

Pethidine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of pethidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).

Description White tablets or film coated tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to 50 mg of pethidine hydrochloride in 5 ml of ethanol and filter. The filtrate complies with test (1) for Identification described under Pethidine Hydrochloride.

(2) Dissolve a quantity of the powdered tablets, equivalent to 0.1 g of pethidine hydrochloride in 10 ml of water and filter. The filtrate complies with tests (2) and (4) for Identification described under Pethidine Hydrochloride.

Content uniformity Comply with the requirements (Appendix X E). Put 1 tablet in a 50 ml (for strength 25 mg) or 100 ml (for strength 50 mg) volumetric flask add a quantity of water, shake thoroughly, dilute to volume with water, mix well and filter. Measure the absorbance of the successive filtrate at 257 nm (Appendix IV A), calculate the content of $C_{15}H_{21}NO_2 \cdot HCl$.

Dissolution Carry out the dissolution test (Appendix XI C method 3), using 100 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Pour 1 tablet (for strength 50 mg) or two tablets (for strength 25 mg) into each cup. Withdraw 10 ml of the solution after exactly 40 minutes and filter. Measure the absorbance of the successive filtrate at 257 nm (Appendix IV A). Dissolve an accurately weighted quantity of pethidine hydrochloride CRS in water, and dilute to produce a solution of 0.5 mg pre ml. Measure in the same way as the test solution. Calculate the dissolution of $C_{15}H_{21}NO_2 \cdot HCl$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 30 tablets (for strength 25 mg) or 20 tablets (for strength 50 mg) with coating removed. Weigh accurately a quantity of the powder equivalent to 250 mg of pethidine hydrochloride to a separator, dissolve pethidine hydrochloride in 15 ml of water, add 3 ml of sodium hydroxide TS and mix well. Extract five times with chloroform (20 ml, 20 ml, 20 ml, 20 ml, 10 ml) and wash the combined extracts with 10 ml of water. Extract the washing with 10 ml chloroform, combine all of the extracts and filter through anhydrous sodium sulfate into conical flask. Wash the anhydrous sodium sulfate with 5 ml of chloroform and combine the washing to the filtrate. Evaporate the filtrate to dryness under vacuum, add 10 ml of glacial acetic acid and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.38 mg of $C_{15}H_{21}NO_2 \cdot HCl$.

Category As described under Pethidine Hydrochloride.

Strength (1) 25 mg (2) 50 mg

Phenformin Hydrochloride

$C_{10}H_{15}N_5 \cdot HCl$ 241.72

[834-28-6]

Phenformin Hydrochloride is 1-(2-phenylethyl)-biguanidine hydrochloride. It contains not less than 99.0% of $C_{10}H_{15}N_5 \cdot HCl$.

Description A white crystal or crystalline powder; odourless; taste, bitter.

Freely soluble in water; soluble in ethanol; practically insoluble in chloroform or ether.

Melting range 174-178°C (Appendix VI C).

Identification (1) To 2 ml of the aqueous solution (1→20) add 2 drops of ammonium cupric sulfate TS; a violet-red precipitate is produced.

(2) The light absorption of a solution of 10 µg per ml in water exhibits a maximum at 234 nm and the absorbance is about 0.60 (Appendix VI A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenformin hydrochloride (Appendix XVI).

Acidity Dissolve 0.20 g in 10 ml of water, pH 6.0-7.0 (Appendix VI H).

Related biguanides Dissolve 1.0 g in methanol in a 10 ml volumetric flask, dilute to volume and mix well. Carry out the method for descending paper chromatography (Appendix V A), using three strips of chromatographic paper 7.5 cm×50 cm in size as absorbent and ethyl acetate-ethanol-water (6 : 3 : 1) as the mobile phase. Apply separately 0.2 ml each of the solution accurately measured to two strips and 0.2 ml of methanol to another strip as blank. Keep the diameter of the spots at 0.5-1 cm. Place the three strips in the tank and allow elution to proceed until the solvent fronts travel to within 7 cm of the lower end of the paper. After removal of the strips, dry them in the air and spray one of the treated strips with a solution prepared as follows: Mix 1 ml each of 10% potassium ferric anide solution, 10% sodium nitro-russide solution and 10% sodium hydroxide solution, allow to stand for 15 minutes, add 10 ml of water and 12 ml of acetone, mix well. The related biguanides occur as red bands with a R_f value of about 0.1. Cut the corresponding position of the second treated strip and the blank strip with an area extending for 1 cm in all directions. Cut into pieces and extract separately with 20 ml of methanol, accurately measured. Measure the absorbance of the resulting solutions at 232 nm (Appendix IV A), the absorbance of related biguanides is not greater than 0.48.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in 30 ml of glacial acetic acid and 5 ml of mercuric acetate TS. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.09 mg of $C_{10}H_{15}N_5 \cdot HCl$.

Category Hypoglycemic agent.

Storage Preserve in tightly closed containers.

Preparation Phenformin Hydrochloride Tablets

Phenformin Hydrochloride Tablets

Phenformin Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of phenformin hydrochloride ($C_{10}H_{15}N_5 \cdot HCl$).

Description White tablets.

Identification (1) Pulverize 20 tablets, add 10 ml of water and shake to dissolve phenformin hydrochloride, filter. The filtrate complies with tests (1) and (4) for Identification described under Phenformin Hydrochloride.

(2) To 2 ml of the filtrate obtained in test (1) add potassium dichromate TS, a yellow precipitate is produced immediately, which is dissolved on adding dilute nitric acid.

(3) Add ammoniated nickel nitrate TS to 2 ml of the filtrate obtained in test (1), a pale yellow precipitate is produced immediately and changes to yellow on standing.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity equivalent to 0.1 g of phenformin hydrochloride in a 250 ml kjeldahl flask add 2 g of potassium sulfate (or anhydrous sodium sulfate) and 0.2 g of powdered cupric sulfate. Then add slowly 10 ml of sulfuric acid along the inner wall of the flask, boil the mixture briskly until a clear, green solution is obtained. Continue the heating for 30 minutes and allow to cool. Dissolve the reaction mixture in water and transfer the solution to a 200 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 5 ml, carry out the method for determination of nitrogen (Appendix VII D, method 2), beginning at the words "Transfer the content of the Kjeldahl flask into the distillator C...". Each ml of sulfuric acid (0.005 mol/L) VS is equivalent to 0.4834 mg of $C_{10}H_{15}N_5 \cdot HCl$.

Category As described under Phenformin Hydrochloride.

Strength 25 mg

Storage Preserve in tightly closed containers.

Phenobarbital

$C_{12}H_{12}N_2O_3$ 232.24

[50-06-6]

Phenobarbital is 5-ethyl-5-phenyl-2,4,6 (1H, 3H, 5H)-pyrimidinetrione. It contains not less than 98.5% of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Description A white lustrous crystalline powder; odourless; taste, slight bitter. The saturated aqueous solution yields acid reaction.

Soluble in ethanol or ether; sparingly soluble in chloroform; very slightly soluble in water; soluble in solutions of sodium hydroxide or sodium carbonate.

Melting range 174.5-178°C (Appendix VI C).

Identification (1) Mix about 10 mg with 2 drops of sulfuric

acid and about 5 mg of sodium nitrite, an orange-yellow colour is produced and then changes to orange-red.

(2) Boil about 50 mg with 1 ml of formaldehyde TS in a test tube and cool. Add slowly 0.5 ml of sulfuric acid along the wall to form a subjacent layer and heat in a water bath, a rose-red ring is formed at the junction of the liquids.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenobarbital (Appendix XVI).

(4) Yields the reactions characteristic of malonylureas (Appendix III).

Acidity Boil 0.20 g with 10 ml of water for 1 minute with stirring, cool and filter. To 5 ml of the filtrate add 1 drop of methyl orange IS, no red colour is produced.

Clarity of ethanolic solution Heat 1.0 g with 5 ml of ethanol for 3 minutes under reflux, the resulting solution is clear.

Neutral or basic substances Dissolve 1.0 g in 10 ml of sodium hydroxide TS in a separator, add 5 ml of water and 25 ml of ether, shake for 1 minute, allow to separate. Wash the ether layer with three portions, each of 5 ml of water, filter the ether solution through dry filter paper to an evaporating dish dried to constant weight at 105°C previously and evaporate to dryness. The residue, dried at 105°C for 1 hour, weights not more than 3 mg.

Loss on drying When dried at 105°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 40 ml of methanol, add 15 ml of freshly prepared 3% anhydrous sodium carbonate solution. Carry out the method for potentiometric titration (Appendix VII A), titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 23.22 mg of $C_{12}H_{12}N_2O_3$.

Category Sedative, hypnotic and anticonvulsant.

Storage Preserve in tightly closed containers.

Preparation Phenobarbital Tablets

Phenobarbital Tablets

Phenobarbital Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of phenobarbital ($C_{12}H_{12}N_2O_3$).

Description White tablets.

Identification Shake thoroughly a quantity of the powdered tablet equivalent to about 0.1 g of phenobarbital with 10 ml of dehydrated ethanol, filter, evaporate the filtrate on a water bath to dryness. The residue complies with the tests (1), (2) and (4) for Identification described under Phenobarbital.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 tablet (for strength 15 mg and 30 mg) to a 100 ml volumetric flask, add a quantity of ethanol-borate potassium chloride BS (Dissolve 12.37 g of boric acid and 14.91 g of potassium chloride in 1000 ml of water with shaking. To 50 ml of the resulting solution, add 36.9 ml of potassium hydroxide TS and dilute to 200 ml with water, adjust pH to 9.6 using 1 mol/L hydrochloric acid solution or potassium hydroxide TS when necessary) (1 : 20), shake thoroughly, dilute to volume and mix well, filter. Measure accurately a quantity of the successive filtrate, dilute with above described buffer solution to produce a solution of 10 µg per ml as the test solution. Dissolve an accurately weighed quantity of

solution of 10 µg per ml as the reference solution. Carry out the method for the spectrophotometry (Appendix IV A). Measure the absorbances of two solutions at 240 nm. Calculate the content of phenobarbital.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exact 45 minutes and filter. Dilute 3 ml (for strength 100 mg), 10 ml (for strength 30 mg) or 20 ml (for strength 15 mg) of the successive filtrate, accurately measured, with borate-potassium chloride BS (pH 9.6) to 50 ml and mix well. Dissolve an accurately weighed quantity of phenobarbital CRS in above described buffer solution to produce a solution of 5 µg per ml. Measure absorbances of the two solutions at 240 nm (Appendix IV A). Calculate the dissolution of $C_{12}H_{12}N_2O_3$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-phosphate BS (mix 6.8 g of potassium dihydrogen phosphate with 4 ml of triethylamine, dilute with water to 1000 ml) (40 : 60) as the mobile phase. Detection wavelength is at 215 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of phenobarbital. Weigh accurately 20 tablets of the powdered tablets equivalent to 30 mg of phenobarbital, to a 100 ml volumetric flask and add a quantity of 40% methanol solution, ultrasonicate for 10 minutes to dissolve phenobarbital, dilute with 40% methanol solution to the volume, mix well and filter. Measure accurately 5 ml of the successive filtrate in 50 ml volumetric flask, dilute with 40% methanol solution to the volume, mix well. Inject 20 µl into the column and record the chromatogram. Dissolve a quantity of phenobarbital CRS, accurately weighed, in 40% methanol solution to produce a solution containing 30 µg per ml. Repeat the operation. Calculate the content of $C_{12}H_{12}N_2O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Phenobarbital.

Strength (1) 15 mg (2) 30 mg (3) 100 mg

Storage Preserve in tightly closed containers.

Phenobarbital Sodium

$C_{12}H_{11}N_2NaO_3$ 254.22

[57-30-7]

Phenobarbital Sodium is 5-ethyl-5-phenyl-2,4,6 (1*H*,3*H*,5*H*)-pyrimidinetrione, monosodium salt. It contains not less than 98.5% of $C_{12}H_{11}N_2NaO_3$, calculated on the dried basis.

Description A white crystalline granule or powder; odourless; taste, bitter; hygroscopic. Very soluble in water; soluble in ethanol; practically insoluble in chloroform or ether.

... (1) Dissolve about 0.5 g in 5 ml of water.

add dilute hydrochloric acid in slight excess, a white crystalline precipitate is produced. Filter, wash the residue with water and dry at 105°C, it has a melting point of 174-178°C (Appendix VI C) and complies with the tests for Identification described under Phenobarbital.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenobarbital sodium (Appendix XVI).

(3) Yields the reactions characteristic of sodium salts (Appendix III).

Alkalinity Dissolve 1.0 g in 10 ml of water, pH 9.5-10.5 (Appendix VI H).

Clarity of solution Dissolve 1.0 g in 10 ml of freshly boiled and cooled water, the resulting solution is clear (for injection).

Loss on drying When dried to constant weight at 150°C, loses not more than 6.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 2.0 g in 32 ml of water, add slowly 8 ml of 1 mol/L hydrochloric acid solution, shake thoroughly, allow to stand for a few minutes, filter. To 20 ml of the filtrate add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution becomes pink, then add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Sterility Dissolve 0.2 g in 4 ml of sterile water, the resulting solution complies with the test for sterility (for injection) (Appendix XI H).

Assay Carry out the Assay described under Phenobarbital, using about 0.2 g, weighed accurately. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 25.42 mg of $C_{12}H_{11}N_2NaO_3$.

Category Sedative, hypnotic and Anticonvulsant.

Storage Preserve in tightly sealed containers, protected from light.

Preparation Phenobarbital Sodium for Injection

Phenobarbital Sodium for Injection

Phenobarbital Sodium for Injection is a sterile crystals or powder of Phenobarbital Sodium preparation. It contains not less than 98.5% of $C_{12}H_{11}N_2NaO_3$, calculated on the dried basis. It contains not less than 93.0% and not more than 107.0% of the labelled amount of phenobarbital sodium ($C_{12}H_{11}N_2NaO_3$), calculated on the basis of average weight of content.

Description White crystalline granules or powder.

Identification Complies with the tests for Identification described under Phenobarbital Sodium.

Alkalinity Complies with the test for alkalinity as described under Phenobarbital Sodium.

Loss on drying When dried at 150°C to constant weight, loses not more than 7.0% of its weight (Appendix VIII L).

Sterility Complies with the test for sterility (Appendix XI H), using a solution of 50 mg per ml in sterile water.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Phenobarbital, using the mixed contents obtained in the tests for weight variation. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 25.42 mg of $C_{12}H_{11}N_2NaO_3$.

Category As described under Phenobarbital Sodium.

Strength (1) 50 mg (2) 100 mg (3) 200 mg

Storage Preserve in well closed containers, protected from light.

Phenol

C_6H_6O 94.11

[108-95-2]

Phenol contains not less than 99.0% of C_6H_6O .

Description Colourless to faint pink needle crystals or a crystalline mass; odour, characteristic; hygroscopic; the colour gradually darkens on exposure to light and air. The aqueous solution exhibits weak acid reaction.

Freely soluble in ethanol, chloroform, ether, glycerin or fixed and volatile oils; soluble in water; sparingly soluble in liquid paraffin.

Congeeing point Not lower than 40°C (Appendix VI D).

Identification Dissolve 0.1 g in 10 ml of water, the solution complies the following tests:

(1) To 5 ml add 1 drop of ferric chloride TS, a violet colour is produced.

(2) To 5 ml add bromine TS, a transient white precipitate is formed, but the precipitate is stable in an excess of the reagent.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenol (Appendix XVI).

Nonvolatile matter When 5.0 g is volatilized on a water bath and dried to constant weight at 105°C, not more than 2.5 mg of residue is obtained.

Assay Dissolve about 0.75 g, accurately weighed, in sufficient water to produce 500 ml. Transfer 25 ml, accurately measured to an iodine flask, add 30.0 ml of bromine (0.05 mol/L) VS, 5 ml of hydrochloric acid, immediately stopper the flask. Shake occasionally for 30 minutes and allow to stand for 15 minutes. Add quickly 6 ml of potassium iodide TS, and immediately stopper the flask, shake thoroughly, then add 1 ml of chloroform and mix well. Titrate with sodium thiosulfate (0.1 mol/L) VS, adding starch IS towards the end-point. Continue the titration until the blue colour disappeared. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 1.569 mg of C_6H_6O .

Category Antiseptic Disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Phenolphthalein

$C_{20}H_{14}O_5$ 318.33

[77-09-8]

Phenolphthalein is 3,3-bis (4-hydroxyphenyl)-1 (3H)-isobenzofuranone. It contains not less than 98.0% and not more than 102.0% of the labelled amount of phenolphthalein ($C_{20}H_{14}O_4$), calculated on the dried basis.

Description White to pale yellow crystals or powder; odourless; tasteless. Soluble in ethanol; sparingly soluble in ether; practically insoluble in water.

Melting range 260-263°C (Appendix VI C).

Identification To a few mg add 2 ml of sodium hydroxide TS or hot sodium carbonate TS. It dissolves to produce a red solution. The colour is disappeared on addition of excess acids.

Colour of ethanol solution Dissolve 0.50 g in 30 ml of ethanol. The solution is colourless or almost colourless.

Fluoran Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and dehydrated ethanol-cyclohexane-xylene (1 : 1 : 4) as the mobile phase, using (1) a solution of 20 mg per ml of the substance being examined in dehydrated ethanol as the test solution, (2) a solution of 0.10 mg per ml of fluoran CRS in dehydrated ethanol as the reference solution. Apply separately to the plate 25 μ l of (1) and 5 μ l of (2). After developing and removal of the plate, dry in air and spray with sulfuric acid-dehydrated ethanol (1 : 1). Heat the plate at 105°C for 5-10 minutes and examine under ultra-violet light (365 nm). The fluorescence produced by any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.10%).

Sensitivity Dissolve 0.10 g in 10 ml of ethanol. To 0.50 ml of the solution add 50 ml of freshly boiled and cooled water, mix well and add 0.25 ml of sodium hydroxide (0.02 mol/L) VS. Pink colour is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Add 10 ml of dilute hydrochloric acid to 1.0 g, heat on a water bath for 5 minutes, cool and filter. Evaporate the filtrate to dryness, add 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve 38 mg, accurately weighed in a 100 ml volumetric flask with 60 ml of ethanol with shaking. Add 10 ml of 0.01 mol/L hydrochloric acid solution and mix well, dilute with ethanol to volume and mix well. Measure accurately 10 ml to another 100 ml volumetric flask, add 10 ml of ethanol and mix well, dilute with 0.01 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance at 275 nm (Appendix IV A), using 0.01 mol/L hydrochloric acid solution as blank, calculate the content of $C_{20}H_{14}O_4$, taking 134 as the value of A (1%, 1 cm).

Category Laxatives.

Storage Preserve in tightly closed containers.

Preparation Phenolphthalein Tablets

Phenolphthalein Tablets

Phenolphthalein Tablets contain not less than

amount of phenolphthalein ($C_{20}H_{14}O_4$).

Description White to slight yellow tablets.

Identification The powdered tablets comply with the test for Identification described under Phenolphthalein.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Transfer an accurately weighed quantity equivalent to about 0.19 g of phenolphthalein to a 100 ml volumetric flask, add ethanol to volume and shake. Filter with a dry filter paper and discard the initial filtrate. Measure accurately 20 ml of the successive filtrate to another 100 ml volumetric flask, add about 40 ml of ethanol and 10 ml of 0.01 mol/L hydrochloric acid solution and mix well, dilute with ethanol to volume and mix well. Transfer accurately 10 ml to a 100 ml volumetric flask, add 10 ml of ethanol and mix well, dilute with 0.01 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance at 275 nm (Appendix IV A), using 0.01 mol/L the hydrochloric acid solution as blank. Calculate the content of $C_{20}H_{14}O_4$, taking 134 as the value of A (1%, 1 cm).

Category As described under Phenolphthalein.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers.

Phenolsulfonphthalein

$C_{19}H_{14}O_5S$ 354.37

[143-74-8]

Phenolsulfonphthalein is 4,4'-(3H-2, 1-benzoxathiol-3-ylidene) bis-phenol, (s, s-dioxide). It contains not less than 98.0% and not more than 102.0% of $C_{19}H_{14}O_5S$, calculated on the dried basis.

Description A red or dark red crystalline powder; odourless. Slightly soluble in ethanol; very slightly soluble in water; practically insoluble in chloroform or ether; freely soluble in alkaline solution.

Identification (1) Dissolve about 10 mg in 1 ml of ethanol, add 100 ml of freshly boiled and cooled water and 0.5 ml of 0.02 mol/L sodium hydroxide solution; a dark red colour develops which changes to orange-yellow or yellow on addition of 1 drop of dilute hydrochloric acid.

(2) Dissolve about 5 mg in a few drops of sodium hydroxide TS, add 2 ml of 0.1 mol/L bromine solution and 1 ml of dilute hydrochloric acid, mix well. Allow to stand for 5 minutes and make alkaline with sodium hydroxide TS; a dark bluish-violet colour is produced.

Alkali insoluble matter To 1 g add 20 ml of 2.5% sodium bicarbonate solution, swirl frequently for 1 hour. Dilute with water to 100 ml and allow to stand for 12 hours. Filter

weight at 105°C and wash the residue with 25 ml of 1% sodium bicarbonate solution, then with 25 ml of water, dry at 1-5°C for 1 hour, the residue is no more than 2 mg (0.2%).

Loss on drying When dried to constant weight over sulfuric acid, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Arsenic Mix thoroughly 0.2 g with 0.5 g of calcium hydroxide in a crucible, add a small quantity of water and evaporate to dryness, ignite gently until it is thoroughly charred, then ignite at 500-600°C until free from carbon. Cool, add 23 ml of water and 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay Dissolve about 0.1 g, accurately weighed, in 20 ml of 0.4% sodium hydroxide solution in an iodine flask and dilute with water to 200 ml. Add accurately 40 ml of bromine (0.05 mol/L) VS, and 10 ml of hydrochloric acid, stopper the flask immediately, shake well and allow to stand for 5 minutes. Remove the stopper cautiously, add 6 ml of potassium iodide TS, stopper again and shake for 1 minute. Titrate with sodium thiosulfate (0.1 mol/L) VS until the end point is nearly approached, add starch IS, titrate until the blue colour just disappears. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 4.430 mg of $C_{18}H_{22}ClNO$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers.

Preparation Phenolsulfonphthalein Injection

Phenolsulfonphthalein Injection

Phenolsulfonphthalein Injection is a sterile solution of phenolsulfonphthalein in Water for Injection made isotonic by the addition of Sodium Chloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of phenolsulfonphthalein ($C_{19}H_{14}O_5S$).

Description A clear, red liquid.

Identification To a quantity of injection equivalent to about 5 mg of phenolsulfonphthalein add 2 ml of 0.1 mol/L bromine solution and 1 ml of dilute hydrochloric acid and shake well. Allow to stand for 5 minutes, make alkaline with sodium hydroxide TS; a dark bluish-violet colour is produced.

pH value 6.5-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Accurately measure 10 ml, to an iodine flask, add 40 ml of water, 20 ml of bromine (0.05 mol/L) VS and 3 ml of hydrochloric acid. Carry out the Assay described under Phenolsulfonphthalein beginning at the words "stopper the flask immediately...". Each ml of bromine (0.05 mol/L) VS is equivalent to 4.430 mg of $C_{19}H_{14}O_5S$.

Category As described under Phenolsulfonphthalein.

Strength 1 ml : 6 mg

Storage Preserve in well closed containers.

Phenoxybenzamine Hydrochloride

$C_{18}H_{22}ClNO \cdot HCl$ 340.29

[63-92-3]

Phenoxybenzamine Hydrochloride is *N*-(2-chloroethyl)-*N*-(1-methyl-2-phenoxy-ethyl) benzyl-amine hydrochloride. It contains not less than 98.5% of $C_{18}H_{22}ClNO \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; almost tasteless. Freely soluble in ethanol or chloroform; slightly soluble in water.

Melting range 137-140°C (Appendix VI C).

Identification (1) Dissolve 50 mg in 50 ml of chloroform in a separator, wash with 0.01 mol/L hydrochloric acid solution for three times, each of 20 ml. Discard the acid washings, filter the chloroform layer through absorbant cotton. Dilute 5 ml of the successive filtrate to 50 ml with chloroform treated with acid [chloroform washed with 0.01 mol/L hydrochloric acid solution, dehydrated with anhydrous sodium sulfate and distilled]. The light absorption of the resulting solution exhibits maxima at 272 nm and 279 nm; the absorbance is about 0.55 and 0.45, respectively (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenoxybenzamine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%; use 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method-2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed in 15 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 34.03 mg of $C_{18}H_{22}ClNO \cdot HCl$.

Category α -Adrenergic receptor inhibitor.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Phenoxybenzamine Hydrochloride Injection

(2) Phenoxybenzamine Hydrochloride Tablets

Phenoxybenzamine Hydrochloride Injection

Phenoxybenzamine Hydrochloride Injection is a sterile solution of Phenoxybenzamine Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

Description A clear, colourless liquid.

Identification To 1 ml add 20 ml of 0.01 mol/L hydrochloric acid solution and extract with chloroform. The chloroform extract is diluted with chloroform treated with acid [chloroform washed with 0.01 mol/L hydrochloric acid solution, dehydrated with anhydrous sodium sulfate and distilled] to produce a solution of 0.1 mg per ml. The light absorption of this solution exhibits maxima at 272 nm and ... 9 nm.

pH value 1.3-3.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Evaporate 10 ml, accurately measured to dryness on a water bath and dry at 105°C for 30 minutes. Allow to cool, dissolve the residue in 10 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS and then titrate with perchloric acid (0.05 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS is equivalent to 17.02 mg of $C_{18}H_{22}ClNO \cdot HCl$.

Category As described under Phenoxybenzamine Hydrochloride.

Strength 1 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Phenoxybenzamine Hydrochloride Tablets

Phenoxybenzamine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

Description White tablets.

Identification (1) The light absorption of the solution obtained in Assay exhibits maxima at 262 nm, 267 nm and 274 nm (Appendix IV A).

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 tablet to a 100 ml (10 mg strength) or 50 ml (5 mg strength) volumetric flask, add a quantity of 0.1 mol/L hydrochloric acid solution, shake thoroughly, dilute to volume and mix well, filter. Carry out the procedure described under Assay using the filtrate. Calculate the content of $C_{18}H_{22}ClNO \cdot HCl$.

Other requirements Comply with the general requirements

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 10 mg of phenoxybenzamine hydrochloride in a 100 ml volumetric flask add 0.1 mol/L hydrochloric acid solution, dilute to volume and mix well, filter, use the successive filtrate as the test solution. To 10 mg of phenoxybenzamine hydrochloride CRS, accurately weighed, in a 100 ml volumetric flask, add 0.1 mol/L hydrochloric acid solution dilute to volume and mix well, use the solution as the reference solution. Measure the absorbances of two solutions at 267 nm (Appendix IV A), calculate the content of $C_{18}H_{22}ClNO \cdot HCl$.

Category As described under Phenoxybenzamine Hydrochloride.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Phenoxymethylpenicillin Potassium

$C_{16}H_{17}KN_2O_5S$ 388.49

[132-98-9]

Phenoxymethylpenicillin Potassium is monopotassium (2S,5R,6R)-3,3-dimethyl-7-oxo-6-(2-phenoxyacetamido)-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. It contains not less than 85.7% of phenoxymethylpenicillin potassium ($C_{16}H_{17}KN_2O_5S$), calculated on the anhydrous basis.

Description White crystals or a crystalline powder; odourless or slight odour; taste, bitter.

Freely soluble in water; practically insoluble in chloroform, ether or liquid paraffin.

Specific optical rotation +215° to +230°, in a solution of 10 mg per ml in freshly boiled and cooled water (Appendix VI E).

Identification (1) The retention time of principal peaks of the solution being examined in the chromatogram obtained in the Assay are identical with that the principal peaks of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of phenoxymethylpenicillin potassium (Appendix XVI).

(3) Yields the flame reaction of potassium salts (Appendix III).

Light Absorbance Measure the absorbance of a solution of 1 mg per ml in 0.1 mol/L sodium hydroxide solution at 306 nm (Appendix IV A), the value of A is not more than 0.33; and measure the absorbance of a solution of 0.2 mg per ml in 0.1 mol/L sodium hydroxide solution at 274 nm (Appendix IV A), the value of A is not less than 0.50.

Crystallinity Comply with the requirements for crystallinity test (Appendix IX D).

Acidity or alkalinity An aqueous solution of 5 mg per ml, pH 5.0-7.5 (Appendix VI H).

Related substances Dissolve a quantity of the substance

being examined, accurately weighed, in the phosphate buffer solution (pH 6.5) described under the Assay, to produce a solution of 2.5 mg per ml as the test solution. Transfer accurately 1 ml to a 100 ml volumetric flask, add phosphate buffer solution (pH 6.5) to volume and mix well, as the reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% of full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column, and record the chromatogram for three times the retention time of the principal peak. If peaks other than the principal peak in the chromatogram obtained with test solution, the sum of the areas of all secondary peaks are not greater than three times the area of the principal peak in the chromatogram obtained with reference solution. Disregard any peak with an area less than 0.05 time the area of the principal peak in the chromatogram obtained with reference solution.

Phenoxymethylpenicillin polymer Carry out the method for size-exclusion chromatography (Appendix V H). Using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10. (40-120 μ m). A phosphate buffer solution [0.1 mol/L disodium hydrogen phosphate-0.1 mol/L sodium dihydrogen phosphate (61 : 39)] as mobile phase A, and water as mobile phase B. The flow rate is 1.5 ml per minute; the detection wavelength is 254 nm. Inject 200 μ l of a solution of 0.1 mg per ml of dextran blue 2000 into the column, elute separately using mobile A and mobile B. The number of the theoretical plates of the column is not less than 700 and the tailing factor is not more than 2.0, calculated with reference to the peak of dextran blue 2000. The ratio of retention time of dextran blue 2000 peak in the two mobile phase is between 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the dextran blue 2000 peak in mobile phase A is between 0.93-1.07, the ratio of retention time of the principal peak of the reference solution and the dextran blue 2000 peak in mobile phase B is between 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with 200 μ l of the reference solution for several replicate injection is not more than 5.0%, using mobile phase B as the eluent.

Reference solution Dissolve an accurately weighed quantity of phenoxymethylpenicillin RS in water to produce a solution of 0.2 mg per ml.

Procedure Dissolve 0.4 g of the substance being examined, accurately weighed, in a 10 ml volumetric flask, dilute to volume with water, mix well. Inject immediately 200 μ l into the column and record the chromatogram using mobile phase A as the eluent. Inject 200 μ l the reference solution into the column and record the chromatogram using mobile phase B as the eluent. The content of phenoxymethylpenicillin polymer is not more than 0.6%, calculated as phenoxymethylpenicillin with respect to the peak area obtained in the chromatogram by the external standard method.

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and water-acetonitrile-glacial acetic acid (65 : 35 : 1) as mobile phase. Detection wavelength is 268 nm. Dissolve an accurately weighed 10 mg each of benzylpenicillin RS and penicillin V RS to a 10 ml volumetric flask, add phosphate buffer solution (pH 6.5) to volume and mix well, inject 20 μ l into the column and record the chromatogram. The resolution factor between

peaks of penicillin V and benzylpenicillin is not less than 3.0.

Procedure Dissolve about 50 mg, accurately weighed, to a 50 ml volumetric flask, add phosphate buffer solution (pH 6.5) (measure 125 ml of 0.2 mol/L potassium dihydrogen phosphate solution, add 250 ml of water, mix well, adjust to pH 6.5 with sodium hydroxide, dilute with water to 500 ml) to volume and mix well. Inject accurately 20 μ l into the volume and record the chromatogram. Repeat the operation, using penicillin V RS instead of the substance being examined, calculate the content of $C_{16}H_{18}N_2O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method. Each mg of $C_{16}H_{18}N_2O_5S$ is equivalent to 1695 penicillin V Units.

Category β -Lactam antibiotic.

Storage Preserve in tightly closed containers, stored in a cool and dark place and protected from light.

Preparation (1) Phenoxymethylpenicillin Potassium Capsules
(2) Phenoxymethylpenicillin Potassium Tablets

Phenoxymethylpenicillin Potassium Capsules

Phenoxymethylpenicillin Potassium Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of phenoxymethylpenicillin ($C_{16}H_{18}N_2O_5S$).

Description White or almost white crystalline granules or powder.

Identification (1) The retention time of principal peaks of the solution being examined in the chromatogram obtained in the Assay are identical with that the principal peaks of the reference solution correspondingly.

(2) Weigh about 1 g of mixed contents and ignite. To the cooled residue add 5 ml of 2 mol/L hydrochloric acid solution and heat to boiling, then cool and filter. The filtrate yields the reaction characteristic of potassium salts (Appendix III).

Related substances Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents, to produce a solution of 2.5 mg per ml in the pH 6.5 phosphate buffer solution obtained in the Assay. Calculate as labelled amount. Filter and use the successive filtrate as the test solution. Carry out the test of related substances under Phenoxymethylpenicillin Potassium, the sum of the area of all impurity peaks is not greater than of area of the principal peak in the chromatogram obtained with reference solution (5.0%) Disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using phosphate BS (pH 6.8) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exact 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the above phosphate BS to produce a solution of 0.15 mg per ml. Measure the absorbance of the resulting solutions at 268 nm (Appendix IV A). Dissolve an accurately weighed quantity of phenoxymethylpenicillin RS in the above phosphate BS to produce a solution of 0.15 mg per ml. Calculate the dissolution of $C_{16}H_{18}N_2O_5S$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Phenoxymethylpenicillin polymer Dissolve an accurately weighed quantity of the mixed contents in the mobile phase A

to produce a solution of 40 mg per ml. Filter and use the successive filtrate as the test solution. Complies with the test under phenoxymethylpenicillin Potassium. The content of Phenoxymethylpenicillin polymer is not more than 0.6%, calculate as phenoxymethylpenicillin.

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately and powder finely the mixed contents obtained in the test for weight variation of contents. Weigh accurately a quantity of powder equivalent to about 50 mg of phenoxymethylpenicillin to a 50 ml volumetric flask, add phosphate buffer solution (pH 6.5) to volume and mix well, filter and use the successive filtrate as the test solution. Carry out the assay described under Phenoxymethylpenicillin Potassium. Each mg of $C_{16}H_{18}N_2O_5S$ is equivalent to 1695 penicillin V Units.

Category As described under Phenoxymethylpenicillin Potassium.

Strength 0.236 g (400000 Units) calculated as $C_{16}H_{18}N_2O_5S$

Storage Preserve in tightly closed containers, stored in a cool and dark place and protected from light.

Phenoxymethylpenicillin Potassium Tablets

Phenoxymethylpenicillin Potassium Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of phenoxymethylpenicillin ($C_{16}H_{18}N_2O_5S$).

Description White tablets or film coated tablets or sugar coated tablets with white core.

Identification (1) The retention time of principal peaks of the solution being examined in the chromatogram obtained in the Assay are identical with that the principal peaks of the reference solution correspondingly.

(2) Weight about 1 g of powdered tablets and ignite. To the cooled residue add 5 ml of 2 mol/L hydrochloric acid solution and heat to boiling, then cool and filter. The filtrate yields the reaction characteristic of potassium salts (Appendix III).

Related substances Weigh accurately and powder finely 10 tablets. Dissolve accurately a quantity of powdered tablets in the phosphate buffer solution (pH 6.5) obtained in the Assay, to produce a solution of 2.5 mg per ml, calculate as labelled amount. Filter and use the successive filtrate as the test solution. Carry out the test for related substances under Phenoxymethylpenicillin Potassium, the sum of the area of all impurity peaks are not greater than of area of the principal peak in the chromatogram obtained with reference solution (5.0%). Disregard any peak with an area less than 0.05 time of area of the principal peak in the chromatogram obtained with reference solution.

Dissolution Carry out the dissolution test (Appendix X C method 2), using 900 ml phosphate BS (pH 6.8) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exactly 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the above phosphate BS to produce a solution of 0.15 mg per ml. Measure the absorbance of the resulting solution at 268 nm (Appendix IV).

phenoxymethylpenicillin RS in the above phosphate BS to produce a solution of 0.15 mg per ml, repeat the operation. Calculate the dissolution of $C_{16}H_{18}N_2O_5S$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Weigh accurately a quantity of powdered tablets equivalent to about 50 mg of phenoxymethylpenicillin to a 50 ml volumetric flask, add phosphate buffer solution (pH 6.5) (measure 0.2 mol/L potassium dihydrogen phosphate 125 ml, add water 250 ml, mix well, adjust to pH 6.5 with sodium hydroxide, dilute with water to 500 ml) to volume and mix well, filter and use the successive filtrate as the test solution. Carry out the Assay described under Phenoxymethylpenicillin Potassium. Each mg of $C_{16}H_{18}N_2O_5S$ is equivalent to 1695 penicillin V Units.

Category As described under Phenoxymethylpenicillin Potassium.

Strength Calculated as $C_{16}H_{18}N_2O_5S$
0.236 g (400000 Units)

Storage Preserve in tightly closed containers, stored in a cool and dark place and protected from light.

Phentolamine Mesylate

$C_{17}H_{19}N_3O \cdot CH_4O_3S$ 377.46

[65-28-1]

Phentolamine Mesylate is 3-[(4,5-dihydro-1H-imidazol-2-yl) methyl] (4-methylphenyl) amino phenol monomethane sulfonate. It contains not less than 99.0% of $C_{17}H_{19}N_3O \cdot CH_4O_3S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Freely soluble in water or ethanol; slightly soluble in chloroform.

Melting range 176-181°C, with decomposition (Appendix VI C).

Identification (1) Melting point of the trichloroacetate obtained in the Assay, 136-141°C with decomposition (Appendix VI C).

(2) Dissolve about 30 mg in 15 ml of water and divide into 3 portions. To one portion add iodine TS, to another portion add mercuric potassium iodide TS, to the last portion add trinitrophenol TS, precipitates are produced in all these portions.

(3) Dissolve a mixture of 50 mg with 0.2 g of sodium hydroxide in a few drops of water and evaporate to dryness. Heat gently to fusion and continue the heating for a few minutes. Cool, add 0.5 ml of water and a slight excess of dilute hydrochloric acid; sulfur dioxide is produced which is recognized by its odour.

Acidity or alkalinity Dissolve 0.10 g in 10 ml of water, add 1 drop of methyl red TS, a red colour is produced; add 0.05 ml of 0.1 mol/L sodium hydroxide VS, the colour

changes to yellow.

Chlorides To 0.10 g add 5 ml of water and 1 ml of dilute nitric acid, warm to 80°C, add 1 ml of silver nitrate TS; no white turbidity is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of water, add slowly 40 ml of 10% trichloroacetic acid solution with stirring. Allow to stand for 2 hours, filter with a tared sintered glass funnel. Wash the precipitate with a small quantity of 10% trichloroacetic acid solution and then with 20 ml of cold water in portions at a temperature below 10°C. Dry the trichloroacetate in vacuum over phosphorous pentoxide to constant weight. Each g of residue is equivalent to 0.8487 g of $C_{17}H_{19}N_3O \cdot CH_4O_3S$.

Category α -adrenergic receptor blocking agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Phentolamine Mesylate Injection

Phentolamine Mesylate Injection

Phentolamine Mesylate Injection is a sterile solution of Phentolamine Mesylate in Water for Injection containing 5% of Dextrose. It contains not less than 95.0% and not more than 105.0% of the labelled amount of phentolamine mesylate ($C_{17}H_{19}N_3O \cdot CH_4O_3S$).

Description A colourless or slight yellow clear liquid.

Identification (1) Melting point of trichloroacetate obtained in the Assay, 136–141°C, with decomposition (Appendix VI C).

(2) To about 3 ml add 12 ml of water, the solution complies with test (2) for Identification described under Phentolamine Mesylate.

pH value 2.5–5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay To a quantity equivalent to about 0.1 g of phentolamine mesylate, accurately measured, add 20 ml of water, carry out the Assay described under Phentolamine Mesylate, beginning at the words "add slowly 40 ml of 10% trichloroacetic acid solution with stirring...".

Category As described under Phentolamine Mesylate.

Strength (1) 1 ml : 5 mg (2) 1 ml : 10 mg

Storage Preserve in tightly closed containers, protected from light.

Phenylalanine

Phenylalanine is *L*-2-amino-3-phenylpropanoic acid. It contains not less than 98.5% of $C_9H_{11}NO_2$, calculated on the dried basis.

Description White crystals or crystalline powder; odourless; taste, slight bitter.

Freely soluble in hot water, sparingly soluble in water, insoluble in ethanol, freely soluble in dilute acid or sodium hydroxide solutions.

Specific optical rotation -33.0° to -35.0° , in a solution of 20 mg per ml in water (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Phenylalanine (Appendix XVI).

Acidity Dissolve 0.20 g in 20 ml of water, pH 5.4–6.0 (Appendix VI H).

Transmittance of solution Dissolve 0.50 g in 25 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorides Carry out the limit test for chlorides (Appendix VII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 0.70 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.4 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-glacial acetic acid-water (5 : 1 : 2) as the mobile phase. Apply to the plate 5 μ l of a solution containing 6 mg per ml of substance being examined in water. After developing and removal of the plate, dry in air, spray with ninhydrin acetone solution (1→50), heat at 90°C until the colour reveal and examine immediately. Only one purple spot is obtained in the chromatogram.

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 25 EU per g of phenylalanine (for injection).

Assay Dissolve about 0.13 g, accurately weighed, in 3 ml of anhydrous formic acid, add 50 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is

equivalent to 16.52 mg of $C_9H_{11}NO_2$.

Category Amino acid.

Storage Preserve in tightly closed containers.

Phenylephrine Hydrochloride

$C_9H_{13}NO_2 \cdot HCl$ 203.67

[61-76-7]

Phenylephrine Hydrochloride is 3-Hydroxy- α -[(methylamino) methyl]-(*R*) benzenemethanol hydrochloride. It contains not less than 98.5% and not more than 102.0% of $C_9H_{13}NO_2 \cdot HCl$.

Description A white or almost white, crystalline powder; odourless; taste, bitter. Freely soluble in water or ethanol; insoluble in chloroform or ether.

Melting range 140-145°C (Appendix VI C).

Specific optical rotation -42° to -47° , in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 10 mg in 1 ml of water, add 1 drop of cupric sulfate TS and 1 ml of sodium hydroxide TS, mix well, a purple colour is produced; add 1 ml of ether and shake, no colour is produced in the ether layer.

(2) Dissolve 10 mg in 1 ml of water, add 1 drop of ferric chloride TS, a purple colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenylephrine hydrochloride (Appendix XVI)

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 50 ml of water, pH 4.5-5.5 (Appendix VI H).

Ketones The absorbance of an aqueous solution of 2.0 mg per ml at 310 nm is not greater than 0.2 (Appendix IV A).

Related substances Protect from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and isopropanol-chloroform-concentrated ammonia solution (80 : 5 : 15) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 20 mg per ml, (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with diazotized sulfanilic acid TS. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in a conical flask with glass stopper in 20 ml of water. Add accurately 50 ml of bromine (0.05 mol/L) VS and 5 ml of hydrochloric acid. Insert the stopper immediately and allow to stand for 15 minutes with frequent shaking. Cautiously remove the stopper and add quickly 10 ml of potassium iodide

VS, add starch IS towards the end of the titration and continue the titration until the blue colour is discharged. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 3.395 mg of $C_9H_{13}NO_2 \cdot HCl$.

Category Adrenergic receptor stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Phenylephrine Hydrochloride Injection

Phenylephrine Hydrochloride Injection

Phenylephrine Hydrochloride Injection is a sterile solution of Phenylephrine Hydrochloride in Water for Injections. It contains not less than 95.0% and not more than 105.0% of the labelled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Complies with the test (1) for Identification described under Phenylephrine Hydrochloride.

(2) Dissolve a quantity of phenylephrine hydrochloride CRS in methanol to produce a solution of 20 mg per ml as the reference solution. The solution (1) obtained in the test for Related substances is used as the test solution. Carry out the test for Related substances, beginning at the words "Carry out the method for thin-layer chromatography...". The colour and position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with the reference solution.

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

pH value 3.0-5.0 (Appendix VI H).

Related Substances Protect from light throughout the procedure. Evaporate a quantity of the injection on a water bath to dryness, add methanol to produce a solution of (1) 20 mg per ml; (2) 0.2 mg of phenylephrine hydrochloride per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-chloroform-concentrated ammonia solution (80 : 5 : 15) as the mobile phase. Apply separately to the same plate 10 μ l each of above two solutions. After developing and removal of the plate, dry it in air, spray with diazotized sulfanilic acid TS. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Accurately measure 5 ml to conical flask with glass stopper, add 1 ml of dilute hydrochloric acid, boil gently to almost dryness and cool. Add 20 ml of water, 25 ml, of bromine (0.05 mol/L) VS accurately measured and 2 ml of hydrochloric acid. Insert the stopper immediately, mix well and allow to stand for 15 minutes with frequent shaking. Cautiously remove the stopper and add quickly 7 ml of potassium iodide TS, insert the stopper immediately and shake thoroughly. Titrate with sodium thiosulfate (0.1 mol/L) VS, add starch IS towards the end of the titration, and continue the titration until the blue colour is discharged. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is

Category As described under Phenylephrine Hydrochloride.

Strength 1 ml : 10 mg

Storage Preserve in tightly closed containers, protected from light.

Phenylpropanol

$C_9H_{12}O$ 136.19

[90-43-7]

Phenylpropanol is α -ethylbenzenemethanol. It contains not less than 98.5% of $C_9H_{12}O$.

Description A colourless or pale yellow oily liquid; odour, aromatic; taste, sweet and acid. Very soluble in methanol, ethanol or chloroform; slightly soluble in water.

Relative density 0.992-0.996 (Appendix VI A).

Refractive index 1.517-1.522 (Appendix VI F).

Identification (1) Mix 10 ml of nitric acid solution (1→2) with 5 drops of 5% potassium dichromate solution. To the mixture add 2 drops of the substance being examined and shake, a pale blue colour is produced.

(2) The light absorption of a solution containing 0.5 mg per ml in ethanol exhibits maxima at 247, 252, 258 and 264 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenylpropanol (Appendix XVI).

Propiophenone The ratio of the absorbance at 247 nm to that at 258 nm obtained under the test for Identification (2) is not greater than 0.79.

Assay To about 0.8 g, accurately weighed, add accurately 5 ml of a freshly prepared mixture of acetic anhydride-pyridine (1 : 4), heat on a water bath under reflux for 1 hour, add 10 ml of water and continue heating for 10 minutes. Allow to cool, rinse the condenser and the neck of the flask with *n*-butanol (previously neutralized to phenolphthalein IS), add 2 drops of phenolphthalein IS. Titrate with sodium hydroxide (0.5 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 68.1 mg of $C_9H_{12}O$.

Category Chologagic.

Storage Preserve in tightly closed containers.

Preparation Phenylpropanol soft Capsules

Phenylpropanol Soft Capsules

Phenylpropanol Soft Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of phenylpropanol ($C_9H_{12}O$).

Description Capsules containing colourless or pale yellow oily liquid; odour, aromatic; taste, sweet and acid.

tests (1) and (2) for Identification described under Phenylpropanol.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Mix the contents obtained in the test for weight variation. Carry out the Assay described under Phenylpropanol. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 68.1 mg of $C_9H_{12}O$.

Category, Storage As described under Phenylpropanol.

Strength (1) 0.1 g (2) 0. g

Phenytoin Sodium

$C_{15}H_{11}N_2NaO_2$ 274.25

[630-93-3]

Phenytoin Sodium is 5,5-diphenylhydantoin sodium salt. It contains not less than 98.5% of $C_{15}H_{11}N_2NaO_2$, calculated on the dried basis.

Description A white powder; odourless; taste, bitter; slightly hygroscopic. It gradually absorbs carbon dioxide on exposure to air and decompose to phenytoin. The aqueous solution yields an alkaline reaction and often becomes turbid due to partial hydrolysis.

Freely soluble in water; soluble in ethanol; practically insoluble in chloroform or ether.

Identification (1) Dissolve about 0.1 g in 2 ml of water, add a few drops of mercuric chloride TS, a white precipitate is produced, which is insoluble in ammonia TS.

(2) To about 10 mg add 10 mg of potassium permanganate, 0.25 g of sodium hydroxide and 10 ml of water, heat gently for 5 minutes, cool. Extract 5 ml of the supernatant liquid with 20 ml of *n*-heptane, allow to separate into two layers. The light absorption of *n*-heptane extract exhibits a maximum at 248 nm (Appendix IV A).

(3) Dissolve about 150 mg of phenytoin sodium in 20 ml of water, add 5 ml of 3 mol/L hydrochloric acid and extract with 20 ml chloroform. Separate the chloroform layer and wash with 20 ml of water. Evaporate the chloroform to dryness on a water bath, dry the residue at 105°C for 1 hour. The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of phenytoin (Appendix XVI).

(4) Yields the characteristic flame reaction of sodium salts (Appendix III).

Clarity and colour of solution Dissolve 0.5 g in 20 ml of freshly boiled and cooled water, add 2 ml of 0.4% sodium hydroxide solution, the solution is clear and colourless.

Loss on drying When dried at 105°C to constant weight, loses not more than 2.0% (for injection) or 2.5% (for oral administration) of its weight (Appendix VIII L).

Heavy metals Dissolve 2.0 g in 37 ml of water by boiling, allow it to cool, add 2.5 ml of dilute hydrochloric acid, mix well and filter. To 20 ml of the filtrate add 1 drop of phenolphthalein IS and a quantity of ammonia TS until the solution becomes pale red, then add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Sterility Dissolve 0.25 g (for injection) in 10 ml of sterile water, the solution complies with the test for sterility (Appendix XI H).

Assay Weigh accurately about 0.3 g and dissolve it in 50 ml of water, add 10 ml of dilute hydrochloric acid, mix well. Extract with ether, 100 ml at first, followed by four 25 ml portions. Wash the combined ether extracts with two portions of water, each of 5 ml. Extract the combined washings with 10 ml of ether and evaporate the combined ether solution in an evaporating dish, previously dried to constant weight at 105°C, dry the residue at 105°C to constant weight. Each g of residue is equivalent to 1.087 g of $C_{15}H_{11}N_2NaO_2$.

Category Anti-epileptic and anti-arrhythmic.

Storage Preserve in tightly closed containers (for oral administration) or in hermetically sealed containers (for injection), protected from light.

Preparation (1) Phenytoin Sodium for Injection
(2) Phenytoin Sodium Tablets

Phenytoin Sodium for Injection

Phenytoin Sodium for Injection is a sterile mixture of ten parts of phenytoin sodium and four parts of anhydrous sodium carbonate. It contains not less than 93.0% and not more than 107.0% of the labelled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$), calculated with reference to the average weight of content.

Description A white powder.

Identification (1) Dissolve a quantity equivalent to about 50 mg of phenytoin sodium in 5 ml of water and add drop-wise dilute sulfuric acid to precipitate phenytoin, filter. Dissolve the precipitate in a mixture of 1 ml of water and 8-10 drops of 0.4% sodium hydroxide solution, add a few drops of mercuric chloride TS, a white precipitate is produced, which is insoluble in ammonia TS.
(2) Complies with tests (2) and (4) for Identification described under Phenytoin Sodium.

Alkalinity Dissolve 0.35 g in 10 ml of water, pH 9.5-11.5 (Appendix VI H).

Loss on drying When dried at 105°C to constant weight, loses not more than 2.5% of its weight (Appendix VIII L).

Sterility Comply with the test for sterility (Appendix XI H), using a solution of 25 mg per ml in sterile water.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately about 0.3 g of the mixed contents obtained in the test for weight variation. Carry out the Assay under Phenytoin Sodium, beginning at the words "dissolve it in 50 ml of water, ...". Calculate on the average weight of content.

Category As described under Phenytoin Sodium.

Strength (1) 0.1 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Phenytoin Sodium Tablets

Phenytoin Sodium Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$).

Description White tablets and film coated tablets.

Identification To a quantity of the powdered tablets equivalent to about 1 g of phenytoin sodium add 20 ml of water to dissolve phenytoin sodium and filter. The filtrate complies with tests (1) and (2) for Identification described under Phenytoin Sodium. Evaporate a quantity of the filtrate to dryness, the residue complies with test (4) for Identification described under Phenytoin sodium.

Dissolution Carry out dissolution test (Appendix X C, method 2), using 500 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter, the successive filtrate is used as the test solution. Dissolve phenytoin sodium CRS in water to produce a solution of 0.2 mg per ml as the reference solution. Measure the absorbances of two solutions at 258 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{11}N_2NaO_2$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder finely 10 (for strength 100 mg) or 20 (for strength 50 mg) tablets. Weigh accurately a quantity equivalent to 0.3 g of phenytoin sodium to a separator, add 25 ml of water, shake to dissolve phenytoin sodium. Add 50 ml of ether, shake and add 10 drops of bromophenol blue IS. Titrate with hydrochloric acid (0.1 mol/L) VS, shaking vigorously, until the aqueous layer becomes bluish-grey. Transfer the aqueous layer to a stoppered conical flask, wash the ether layer with 5 ml of water. Combine the washing with the aqueous layer in the conical flask, add 20 ml of ether, continue the titration with hydrochloric acid (0.1 mol/L) VS, shaking vigorously, until the aqueous layer becomes pale green. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 27.43 mg of $C_{15}H_{11}N_2NaO_2$.

Category As described under Phenytoin Sodium.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Pholcodine

$C_{23}H_{30}N_2O_4 \cdot H_2O$ 416.52

[509-67-1]

Pholcodine is (5R,6S)-4,5-epoxy-9a-methyl-3-

ohydrate. It contains not less than 98.0% of $C_{23}H_{30}N_2O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter. The aqueous solution exhibits an alkaline reaction.

Freely soluble in ethanol, acetone or chloroform; sparingly soluble in water; slightly soluble in ether; soluble in dilute hydrochloric acid.

Specific optical rotation -94° to -98° , in a solution of 20 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve about 50 mg in 1 ml of sulfuric acid, add 1 drop of ammonium molybdate TS, a pale blue colour is produced which changes to deep blue on warming, then changes to brownish red on adding 1 drop of dilute nitric acid.

(2) The light absorption of a solution of 0.1 mg per ml in 0.4% sodium hydroxide solution in the range of 230–350 nm (Appendix IV A) exhibits a maximum at 284 nm and a minimum at 262 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Pholcodine (Appendix XVI).

Morphine Dissolve 0.10 g in 5 ml of hydrochloric acid solution (9→1000), add 2 ml of sodium nitrite TS, mix well, allow to stand for 15 minutes, add 3 ml of ammonia TS, mix well. Any colour produced is not more intense than that of a reference solution using 5 ml of morphine solution [dissolve 2 mg of anhydrous morphine in hydrochloric acid solution (9→1000) to produce 100 ml] (0.1%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethanol-toluene-acetone-concentrated ammonia solution (70 : 70 : 65 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of the following solutions in chloroform containing (1) 25 mg per ml, (2) 0.25 mg per ml, (3) 0.125 mg per ml of the substance being examined. After developing and removal of the plate, dry in air, visualize with iodine vapour. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2); not more than one secondary spot above the principal spot is more intense than the principal spot obtained with solution (3).

Loss on drying When dried to constant weight at 105°C , loses not more than 3.9% and not less than 4.5% of its weight (Appendix VIII L); use 0.50 g.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.93 mg of $C_{23}H_{30}N_2O_4$.

Category Antitussive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Pholcodine Tablets

Pholcodine Tablets

and not more than 110.0% of the labelled amount of pholcodine ($C_{23}H_{30}N_2O_4 \cdot H_2O$).

Description White or almost white tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.2 g of pholcodine add 20 ml of dehydrated ethanol, shake for 5 minutes to dissolve pholcodine, filter and evaporate the filtrate to dryness on a water bath. The residue complies with test (1), (2) for Identification described under Pholcodine.

(2) Dissolve the residue obtained in test (1) for Identification in chloroform to produce a solution containing 25 mg of pholcodine per ml as test solution. Prepare reference solution of 25 mg per ml of pholcodine CRS in chloroform. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethanol-toluene-acetone-concentrated ammonia solution (70 : 70 : 65 : 5) as the mobile phase. Apply separately to the same plate 10 μ l each of above two solutions, after developing and removal of the plate, dry in air, visualize with iodine vapour. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with 25 ml of hydrochloric acid solution (9→1000) and transfer to a 50 ml volumetric flask, add water to volume, shake thoroughly and filter, measure accurately a quantity of the successive filtrate to produce a solution of 30 μ g per ml in water as the test solution. Carry out the procedure described under Assay, calculate the content of $C_{23}H_{30}N_2O_4 \cdot H_2O$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Reference solution* Dissolve about 30 mg of pholcodine CRS, accurately weighed, in a 50 ml volumetric flask with 25 ml of hydrochloric acid solution (9→1000), dilute with water to volume, mix well. Measure accurately 5 ml to a 100 ml volumetric flask, dilute with water to volume, mix well.

Test solution Weigh and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 30 mg of pholcodine, to a 50 ml volumetric flask, add 25 ml of hydrochloric acid solution (9→1000), shake thoroughly to dissolve pholcodine, dilute with water to volume. Filter, measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with water to volume.

Procedure Measure accurately 2 ml each of the two solutions to two separators containing 10 ml of chloroform accurately measured, respectively. Add 6.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium bipthalate in 1.6 ml of 0.2 mol/L hydrochloric acid solution, dilute with water to 100 ml, filter if necessary], extract for 2 minutes with shaking, allow to stand. Dry the chloroform extracts by shaking with 0.5 g of anhydrous sodium sulfate. Measure the absorbances of the resulting solutions at 420 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}N_2O_4 \cdot H_2O$.

Category As described under Pholcodine.

Strength (1) 5 mg (2) 10 mg (3) 15 mg

Storage Preserve in tightly closed containers, protected from light.

Pilocarpine Nitrate

$C_{11}H_{16}N_2O_2 \cdot HNO_3$ 271.27 [148-72-1]

Pilocarpine Nitrate is 3-ethyl-4-[(1-methyl-1H-imidazol-5-yl)methyl]-2-(3H)-furanone nitrate. It contains not less than 99.0% of $C_{11}H_{16}N_2O_2 \cdot HNO_3$, calculated on the dried basis.

Description A colourless crystal or white crystalline powder; odourless; deteriorates easily on exposure to light. Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Melting range 174-178°C, with decomposition (Appendix VI C).

Specific optical rotation +80° to +83°, in a solution of 0.10 g per ml in water (Appendix VI E).

Identification (1) Dissolve about 10 mg in 2 ml of water, add 2 drops of potassium dichromate TS, 1 ml of hydrogen peroxide solution and 2 ml of chloroform in order, shake, the chloroform layer exhibits a violet colour.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pilocarpine nitrate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of nitrates (Appendix III).

Acidity or alkalinity Dissolve 1.0 g in 20 ml of water, divide the solution into two equal portions; to one portion add 1 drop of methyl red IS, a red colour is produced; to the other portion add 2 drops of bromophenol blue IS, a blue colour is produced.

Chlorides Dissolve 0.10 g in 5 ml of water, acidify with dilute nitric acid and add a few drops of silver nitrate TS; no opalescence is produced immediately.

Other alkaloids Dissolve 0.2 g in 20 ml of water, divide the solution into two equal portions; to one portion add a few drops of ammonia TS; to the other portion add a few drops of potassium dichromate TS; no opalescence is produced in any one of the solutions.

Readily carbonizable substances Dissolve 10 mg in 1 ml of sulfuric acid and 0.5 ml of nitric acid; the solution is colourless.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml of glacial acetic acid by warming and allow to cool. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 27.13 mg of $C_{11}H_{16}N_2O_2 \cdot HNO_3$.

Category Miotic.

Storage Preserve in tightly closed containers, protected

Preparation Pilocarpine Nitrate Eye Drops

Pilocarpine Nitrate Eye Drops

Pilocarpine Nitrate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of pilocarpine nitrate ($C_{11}H_{16}N_2O_2 \cdot HNO_3$).

Description A clear, colourless liquid.

Identification Comply with tests (1) and (3) for Identification described under Pilocarpine Nitrate.

pH value 4.0-6.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. The mobile phase is prepared as following: dissolve 2.94 g of sodium acetate in 38.4 ml of dilute acetic acid, 600 ml of water (pH 4.5), mix with 400 ml of methanol. The wavelength of the detection is 230 nm. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of pilocarpine and the resolution factor between the peaks of pilocarpine and the internal standard complies with related requirements. Dissolve 50 mg of pilocarpine nitrate CRS previously dried at 105°C for 2 hours, accurately weighed, in a 50 ml volumetric flask in the mobile phase, dilute to volume with the same solvent and mix well (reference solution). Dissolve a quantity of benzoic acid in the mobile phase to produce a solution of 90 µg per ml (internal standard). Measure accurately 10 ml of the reference solution and 10 ml of the internal standard into a 50 ml volumetric flask, dilute to volume with the mobile phase and mix well. Inject about 20 µl of the solution into the column and record the chromatogram. To a quantity of the eye drops equivalent to 10 mg of pilocarpine nitrate in a 50 ml volumetric flask add 10 ml of the internal standard solution, measured accurately, and dilute to volume with the mobile phase, mix well. Inject about 20 µl into the column, record the chromatogram. Calculate the content of $C_{11}H_{16}N_2O_2 \cdot HNO_3$ with respect to the peak area in the chromatogram by internal standard method.

Category As described under Pilocarpine Nitrate.

Strength (1) 5 ml : 25 mg (2) 5 ml : 100 mg
(3) 10 ml : 50 mg (4) 10 ml : 100 mg
(5) 10 ml : 200 mg

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Pindolol

$C_{14}H_{20}N_2O_2$ 248.32 [13523-86-9]

Pindolol is 1-(indol-4-yloxy)-3-(isopropylamino)-2-propanol. It contains not less than 99.0% of $C_{14}H_{20}N_2O_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odour, slight characteristic.

Freely soluble in glacial acetic acid; slightly soluble in methanol or ethanol; practically insoluble in water or benzene.

Melting range 167-171°C (Appendix VI C).

Identification (1) The light absorption of a solution of 10 µg per ml in dehydrated ethanol exhibits two maxima at 265 nm and 288 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pindolol (Appendix XVI).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 24.83 mg of $C_{14}H_{20}N_2O_2$.

Category Adrenaline receptor blocking agent.

Storage Preserve in tightly closed containers, protected from light.

Pipemidic Acid

$C_{14}H_{17}N_5O_3 \cdot 3H_2O$ 357.37

[51940-44-4]

Pipemidic Acid is 8-ethyl-5-oxo-5,8-dihydro-2-(1-piperazinyl)-pyrido [2,3-d] pyrimidine-6-carboxylic acid. It contains not less than 98.5% of $C_{14}H_{17}N_5O_3$, calculated on the dried basis.

Description A slight yellow to yellowish crystalline powder; odourless; taste, bitter.

Slightly soluble in methanol or dimethylformamide; very slightly soluble in water or chloroform; insoluble in ethanol, ether or benzene; freely soluble in acid or alkaline solution.

Melting range 251-256°C, with decomposition (Appendix VI C).

Identification (1) To about 10 mg in a dry test tube add a small quantity of malonic acid and 3 drops of acetic anhydride, warm in a water bath for 5 minutes; a deep brown colour is produced.

(2) The light absorption of a solution of about 4 µg per ml in 0.04% sodium hydroxide solution exhibits maxima at 273 nm and 333 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pipemidic acid (Appendix XVI).

Clarity of alkaline solution Dissolve 0.50 g in 10 ml of sodium hydroxide TS, the solution is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica HF₂₅₄ as the coating substance and a mixture of methanol-chloroform-toluene-diethylamine-water (45 : 40 : 20 : 14 : 8) as the mobile phase. Apply separately to the plate 5 µl each of three solutions in the mixture of dichloromethane-methanol (1 : 1) containing (1) 10 mg per ml of the substance being examined, (2) 0.10 mg per ml, (3) 0.05 mg per ml of the solution. After developing and removal of the plate, dry it in air and examine under ultraviolet (254 nm). Not more than 2 secondary spots are observed in the chromatogram obtained with the substance. Any secondary spot is not more intense than the principal spot obtained with solution (2); if one spot is more intense, it is not more intense than the principal spot obtained with solution (1).

Loss on drying When dried to constant weight at 105°C, loses not less than 15.0%, and not more than 16.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 30.33 mg of $C_{14}H_{17}N_5O_3$.

Category Antibacterial agent.

Storage Preserve in tightly closed containers.

Preparation (1) Pipemidic Acid Capsules
(2) Pipemidic Acid Tablets

Pipemidic Acid Capsules

Pipemidic Acid Capsules contain not less than 95.0% and not more than 105.0% of the labelled amount of Pipemidic Acid ($C_{14}H_{17}N_5O_3 \cdot 3H_2O$).

Identification (1) The contents of pipemidic acid capsules equivalent to about 10 mg of pipemidic acid comply with test for Identification (1) described under Pipemidic Acid.

(2) The light absorption of the solution obtained in Assay exhibits maxima at 273 nm and 333 nm (Appendix IV A).

Dissolution Comply with the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid TS with water to 1000 ml) as the dissolution medium, adjust the rotation speed of the basket to 100 rpm. Withdraw the solution at 30 minutes and filter. Dilute 2 ml of the successive filtrate with the hydrochloric acid solution to 100 ml and mix well. Dissolve pipemidic acid CRS in the hydrochloric acid solution to produce a solution of about 4 mg $C_{14}H_{17}N_5O_3 \cdot 3H_2O$ per ml (the calculation converting factor from $C_{14}H_{17}N_5O_3$ to $C_{14}H_{17}N_5O_3 \cdot 3H_2O$ is 1.178). Measure the absorbances of the resulting solutions at 275 nm (Appendix IV A). Calculate the dissolution of $C_{14}H_{17}N_5O_3 \cdot 3H_2O$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of mixed contents obtained from test for weight variation of contents

equivalent to about 50 mg of pipemidic acid in a 250 ml volumetric flask, add a quantity of 0.04% sodium hydroxide solution, shake thoroughly, then dilute to volume, shake well and filter. Dilute 2ml of the successive filtrate with 0.04% sodium hydroxide solution to 100 ml and mix well. Measure the absorbance of the solution at 273 nm (Appendix IV A), using the 0.04% sodium hydroxide solution as the blank, calculate the content of $C_{14}H_{17}N_5O_3 \cdot 3H_2O$, taking 1339 as the value of A (1%, 1 cm).

Category As described under pipemidic acid.

Strength 0.25 g

Storage Preserve in tightly closed containers.

Pipemidic Acid Tablets

Pipemidic Acid Tablets contain not less than 95.0% and more than 105.0% of the labelled amount of pipemidic acid ($C_{14}H_{17}N_5O_3 \cdot 3H_2O$).

Description Yellow or film-coated tablets with pale yellow core.

Identification (1) 10 mg of powdered tablets comply with test (1) for Identification described under pipemidic acid. (2) The light absorption of the solution obtained in Assay exhibits maxima at 273 nm and 333 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 24 ml of dilute hydrochloric acid diluted with water to produce 1000 ml as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 30 minutes and filter, measure accurately 2 ml of the successive filtrate, dilute with the same medium to 100 ml (for strength 0.25 g) or to 200 ml (for strength 0.5 g), mix well. Measure the absorbance at 273 nm (Appendix IV A), calculate the dissolution of $C_{14}H_{17}N_5O_3 \cdot 3H_2O$ from each tablet, taking 1339 as the value of A (1%, 1 cm): not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powdered tablets, equivalent to about 0.1 g of pipemidic acid in a 500 ml volumetric flask add a quantity of 0.04% sodium hydroxide solution, shake thoroughly and dilute to volume, shake well and filter. Transfer accurately 2 ml of the successive filtrate, to a 100 ml volumetric flask, dilute to volume with 0.04% sodium hydroxide solution, shake well. Measure the absorbance of the solution at 273 nm, using the 0.04% sodium hydroxide solution as the blank (Appendix IV A), calculate the content of $C_{14}H_{17}N_5O_3 \cdot 3H_2O$, taking 1339 as the value of A (1%, 1 cm).

Category As described under Pipemidic acid.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers.

Piperacillin

$C_{23}H_{27}N_5O_7S \cdot H_2O$ 535.58

[61477-96-1]

Piperacillin is (2S,5R,6R)-3,3-dimethyl-6-[(4-ethyl-2,3-dioxo-1-piperazinecarboxamido)phenylacetamido]-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid monohydrate. It contains not less than 92.0% of $C_{23}H_{27}N_5O_7S$, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; slightly hygroscopic.

Freely soluble in methanol; soluble in dehydrated ethanol or acetone; very slightly soluble in water.

Specific optical rotation +160° to +178°, in a solution of 10 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) To 10 mg add 2 ml of water and 3 ml of hydroxylamine hydrochloride solution [mix one volume of 34.8% hydroxylamine hydrochloride solution with one volume of sodium acetate-sodium hydroxide solution (to 10.3 g of sodium acetate and 86.5 g of sodium hydroxide add water to produce a solution of 1000 ml) and 4 volumes of ethanol], shake thoroughly. Allow to stand for 5 minutes, add 1 ml of acidic ferric ammonium sulfate TS, mix well; a reddish-brown colour is produced.

(2) The retention time of principal peak of the substance being examined is identical with that of piperacillin CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piperacillin (Appendix XVI).

Acidity Mix well a quantity with water to produce a suspension of 10 mg per ml, pH 2.5-4.0 (Appendix VI H).

Clarity and colour of solution To each of 5 portions add methanol to produce solutions of 0.1 g per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₂ or Y₂ (Appendix IX A, method 1).

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.2 mol/L sodium dihydrogen phosphate solution 10% tetraethyl ammonium hydroxide solution-water (400 : 50 : 3 : 547) as the mobile phase, adjust the pH with phosphoric acid to 5.5, wavelength of the detector is 254 nm. The number of theoretical plates of the column is not less than 1600, calculated with reference to the peak of piperacillin.

Procedure Dissolve about 40 mg of the substance being examined, accurately weighed, in a quantity of methanol in which it is freely soluble, add 10 ml of the mobile phase to

volume and mix well. Inject 10 μ l into the column. Repeat the operation using piperacillin CRS instead of the substance being examined, calculate the content of $C_{23}H_{27}N_5O_7S$.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, protected from light, stored in a cool and dry place.

Piperacillin Sodium

$C_{23}H_{26}N_5O_7S$ 539.54

[59703-84-3]

Piperacillin Sodium is sodium (2S,5R,6R)-3,3-dimethyl-6-[(4-ethyl-2,3-dioxo-1-piperazinecarboxamido) phenylacetamido]-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate. It contains not less 87.0% of piperacillin ($C_{23}H_{27}N_5O_7S$), calculated on the anhydrous basis.

Description A White or almost white powder; odourless; very hygroscopic.

Freely soluble in water or methanol, soluble in dehydrated ethanol, insoluble in acetone.

Specific optical rotation $+175^\circ$ to $+190^\circ$, in an aqueous solution of 10 mg per ml (Appendix VI E).

Identification (1) Complies with tests (1) and (2) for Identification described under Piperacillin.

(2) Yields the characteristic flame reaction of sodium salts (Appendix III).

Acidity An aqueous solution of 100 mg per ml, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution To each of 5 portions add water to produce solutions of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₂ or Y₂ (Appendix IX A).

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 0.1 g per ml in sterile Water for Injections per kg of the rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolve each container in a feasible solvent and dilute with all of 500 ml of 0.9% steril sodium chloride solution respectively.

Assay Dissolve an accurately weighed quantity in water, carry out the assay described under Piperacillin.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, stored in a cool, dark and dry place.

Preparation Piperacillin Sodium for Injection

Piperacillin Sodium for Injection

Piperacillin Sodium for Injection is a sterile powder of Piperacillin sodium or sterile lyophilized preparation of sodium salt of Piperacillin. It contains not less than 87.0% of piperacillin ($C_{23}H_{27}N_5O_7S$), calculated on the anhydrous basis. Each container contains not less than 95.0% of piperacillin ($C_{23}H_{27}N_5O_7S$), calculated with reference to the average weight of contents.

Description A white or almost white powder or friable solid; odourless; highly hygroscopic. Very soluble in water or methanol, soluble in dehydrated ethanol, insoluble in acetone.

Specific optical rotation $+175^\circ$ to $+190^\circ$ in a solution of 10 mg per ml in water (Appendix VI E).

Identification Complies with the tests for Identification described under Piperacillin Sodium.

Acidity Dissolve a quantity in water produce a solution of 100 mg per ml, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce a solution of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₂ of Y₂ (Appendix IX A, method 1).

Water, Pyrogens, Sterility Complies with the corresponding requirements described under Piperacillin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the assay described under Piperacillin, using an accurately weighed quantity of mixed contents obtained from the test for weight variation of contents.

Category β -lactam antibiotic, penicillins.

Strength Calculated as $C_{23}H_{27}N_5O_7S$
(1) 0.5 g (2) 1.0 g (3) 2.0 g

Storage Preserve in well closed containers, stored in a cool, dark and dry place.

Piperaquine Phosphate

$C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4 \cdot 4H_2O$ 999.56

Piperaquine Phosphate is 1,3-bis[4-(7-chloroquinolinyl)-4]-piperazinyl-1] propane tetraphosphate tetrahydrate. It contains not less than 98.0% of $C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4$, calculated on the anhydrous basis.

Description An almost white to pale yellow crystalline powder; odourless; taste, slightly bitter; deepened easily

Slightly soluble in water; practically insoluble in dehydrated ethanol or chloroform.

Melting range 246-252°C, with decomposition (Appendix VI C).

Identification (1) Dissolve 50 mg in 3 ml of water by warming. Cool, divide the solution into two portions. To one portion, add a few drops of ammonium thiocyanate TS; a white precipitate is produced. To the other portion, add a few drops of potassium dichromate TS; a yellow precipitate is produced.

(2) The light absorption of a solution of 10 µg per ml in hydrochloric acid solution (9→1000) exhibits maxima at 226 nm, 240 nm and 347 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piperaquine phosphate (Appendix XVI).

(4) Dissolve a quantity in hot water, add ammonia TS and filter. The filtrate yields the reactions characteristic of phosphates (Appendix III).

Acidity Dissolve 0.10 g in 40 ml of water, pH 3.0-4.0 (Appendix VI H).

Water 6.0%-8.0% (Appendix VIII M, method 1 A).

Assay Dissolve about 0.2 g, accurately weighed, in a small beaker with 0.5 ml of hydrochloric acid, add 10 ml of water and stir thoroughly. Transfer the solution to a separator, wash the beaker successively with small quantities of water, add the washings to the separator. Add 10 ml of 20% sodium hydroxide solution, mix and extract with four 20 ml portions of chloroform. Wash each chloroform extract with the same 10 ml portion of water. Combine the chloroform extracts and filter, wash the filter paper with chloroform. Combine the filtrate and washings, evaporate on a water bath to about 5 ml, then add 20 ml of acetic anhydride. Shake to dissolve. Add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS to a bright green colour. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.19 mg of $C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4$.

Category Antimalarial.

Storage Preserve in tightly closed containers, protected from light.

Preparation Piperaquine Phosphate Tablets

Piperaquine Phosphate Tablets

Piperaquine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of piperaquine phosphate ($C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4$).

Description Sugar coated tablets with white or light yellow core.

Identification (1) To a quantity of powdered tablets, equivalent to about 0.1 g of piperaquine phosphate, add 5 ml of water, dissolve the piperaquine phosphate by heating and filter. The filtrate complies with test (1) for Identification described under Piperaquine Phosphate.

(2) To the remaining filtrate obtained in the test described above, add 0.5 ml of ammonia TS, stir and filter. To the filtrate add 4 drops of nitric acid solution (1→2), 1 ml of ammonium molybdate TS and heat; a yellow precipitate is produced, which is soluble in ammonia TS.

Assay exhibits maxima at 226 nm and 240 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets with coating removed. To a quantity of the powder equivalent to about 20 mg of piperaquine phosphate, accurately weighed, in a 100 ml volumetric flask add a quantity of hydrochloric acid solution (9→1000), heat on a water bath with shaking. Cool to room temperature, dilute with hydrochloric acid solution (9→1000) to volume and mix. Filter, transfer accurately 5 ml of the successive filtrate to another 100 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance of the resulting solution at 240 nm (Appendix IV A). Calculate the content of $C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4$, taking 566 as the value of A (1%, 1 cm).

Category As described under Piperaquine Phosphate.

Strength Calculated on $C_{29}H_{32}Cl_2N_6 \cdot 4H_3PO_4$
0.25 g

Storage Preserve in tightly closed containers, protected from light.

Piperazine Citrate

$(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot 5H_2O$ 732.74 [110-85-0]

Piperazine Citrate contains not less than 98.5% of $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7$, calculated on anhydrous basis.

Description A white crystalline powder or translucent crystalline granule; odourless; taste, sour; slightly hygroscopic.

Very soluble in water; slightly soluble in methanol; insoluble in ethanol, chloroform, ether, benzene or petroleum ether.

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 0.5 g of sodium bicarbonate, 0.5 ml of potassium ferricyanide TS and 1 drop of mercury, shake vigorously for 1 minute and allow to stand for about 20 minutes at a temperature above 20°C, a red colour is slowly produced.

(2) The aqueous solution yields the reactions characteristic of citrates (Appendix III).

Primary amines and ammonia Dissolve 0.50 g in 10 ml of water and 1.0 ml of 10% sodium hydroxide solution. Add 1.0 ml each of acetone and sodium nitroprusside TS, mix well and allow to stand for exact 10 minutes. Measure the absorbance of the resulting solution at 520 nm and 600 nm (Appendix IV B), using a blank consisting of the same quantities of the reagents, but substituting water for the sodium hydroxide solution, the ratio of the absorbance at 600 nm to that at 520 nm is not greater than 0.50 (equivalent to about 0.7% of primary amines and ammonia).

Water 10.0%-14.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VII

Iron Dissolve 2.0 g in a mixture of 35 ml of water and 3 ml of hydrochloric acid, add 50 mg of ammonium persulfate, 3 ml of ammonium thiocyanate solution (30 → 100) and sufficient water to produce 50 ml, mix well. Extract with 20 ml of *n*-butanol. Any colour produced in the *n*-butanol layer is not more intense than that of a reference using 1.0 ml of iron standard solution prepared in a similar manner (0.0005%).

Heavy metals Dissolve 2.0 g in 20 ml of water, add 4.0 ml of dilute hydrochloric acid, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.1 g, accurately weighed, in 30 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution changes to greenish-blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.71 mg of $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot 5H_2O$.

Category Anthelmintic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Piperazine Citrate Syrup
(2) Piperazine Citrate Tablets

Piperazine Citrate Syrup

Piperazine Citrate Syrup contains not less than 14.4% and not more than 17.6% (g/ml) of the labelled amount of piperazine citrate $[C_4H_{10}N_2]_3 \cdot 2C_6H_8O_7 \cdot 5H_2O$.

Formula	Piperazine Citrate	160 g
	Sucrose	650 g
	Preservative	a sufficient quantity
	Flavouring agent	a sufficient quantity
	Water	a sufficient quantity
	Total	1000 ml

Description A clear, viscous liquid with an aromatic odour.

Identification Dilute 3 ml with 2 ml of Water. Complies with the test (1) for Identification described under Piperazine Citrate.

Relative density 1.270–1.305 (Appendix VI A).

Other requirements Complies with the general requirements for syrups (Appendix I K).

Assay Transfer accurately 5 ml with a “to contain” pipet to a 50 ml volumetric flask. Wash the inner wall of the pipet with a small amount of water, add the washings into the flask, dilute to volume with water and mix well. Transfer accurately 10 ml into a 150 ml beaker, add 70 ml of trinitrophenol TS, stir and heat until the supernatant liquid is clear. Cool to room temperature and allow it to stand for one hour. Filter through a tared sintered glass crucible previously dried to constant weight at 105°C. Wash the precipitate with successive quantities of a saturated solution of piperazine trinitrophenol derivative $(C_4H_{10}N_2 \cdot 2C_6H_3N_3O_7)$. Dry to constant weight at 105°C and weigh accurately. Each g of precipitate is equivalent to 0.4487 g of $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot 5H_2O$.

Category As described under Piperazine Citrate.

Storage Preserve in tightly closed containers, protected

from light.

Piperazine Citrate Tablets

Piperazine Citrate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of piperazine citrate $[(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot 5H_2O]$.

Description White tablets.

Identification To a quantity of the finely powdered tablets, equivalent to about 0.5 g of piperazine citrate, add 20 ml of water, shake to dissolve piperazine citrate and filter. The filtrate complies with the tests for Identification described under Piperazine Citrate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 0.1 g of piperazine citrate and carry out the Assay described under Piperazine Citrate. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 12.21 mg of $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot 5H_2O$.

Category As described under Piperazine Citrate.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Piperazine Ferulate

$C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$ 474.51

Piperazine Ferulate is 3-methoxy-4-hydroxy cinnamate piperazine. It contains not less than 99.0% of $C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$, calculated on the dried basis.

Description White or almost white crystalline flakes or crystalline powder; odourless; taste, slightly astringency. Slightly soluble in water; very slightly soluble in ethanol; practically insoluble in trichloromethane.

Specific absorbance Protected from light throughout the procedure. Measure the absorbance of a solution of 6 µg per ml in water at 310 nm (Appendix IV A), the value of A (1%, 1 cm) is 637–669.

Identification (1) The light absorption of a solution of 6 µg per ml in water exhibits two maxima at 287 nm and 310 nm, and a minimum at 254 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piperazine ferulate (Appendix XVI).

Acidity An aqueous solution of 0.1 mg per ml, pH 4.5–6.0 (Appendix VI H).

Related substances Protected from light throughout the

procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (10 : 6 : 3) as mobile phase. Apply separately to the plate 20 μ l each of three solutions in methanol containing (1) 80 μ g per ml of ferulic acid CRS, (2) 50 μ g per ml of piperazine CRS and (3) 5 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, visualize in iodine vapour and observe immediately. Not more than 2 secondary spots, other than the spots correspond to the principal spots obtained with solutions (1), (2) are observed with solution (3); and any secondary spot is not more intense than the principle spot obtained with solution (1).

Loss on drying When dried in vacuum to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.73 mg of $C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$.

Category Anticoagulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Piperazine Ferulate Tablets

Piperazine Ferulate Tablets

Piperazine Ferulate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of piperazine ferulate ($C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$).

Description White or almost white tablets.

Identification The light absorption of the solution obtained under the Assay exhibits maxima at 287 nm and 310 nm, and minimum at 254 nm (Appendix IV A).

Dissolution Protected from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with water to 25 ml (for strength 50 mg) or 50 ml (for strength 100 mg), shake thoroughly, carry out the method as described under the Assay. Calculate the dissolution of $C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protected from light throughout the procedure. Weigh accurately and powder 10 tablets. Weigh accurately a

piperazine ferulate into a 250 ml volumetric flask, dissolve and dilute with water to volume, mix well and filter. Transfer accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute to volume with water and mix well. Measure the absorbance of the resulting solution at 310 nm (Appendix IV A). Dissolve a quantity of piperazine ferulate CRS, weigh accurately in water to produce a reference solution of 6 μ g per ml. Measure the absorbance of the reference solution in the same manner. Calculate the content of $C_4H_{10}N_2 \cdot 2C_{10}H_{10}O_4$.

Category As described under Piperazine Ferulate.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Piperazine Phosphate

$C_4H_{10}N_2 \cdot H_3PO_4 \cdot H_2O$ 202.15 [18534-18-4]

Piperazine Phosphate contains not less than 98.5% of $C_4H_{10}N_2 \cdot H_3PO_4$, calculated on the anhydrous basis.

Description White crystalline scales of a crystalline powder; odourless; taste, slightly acerbic. Sparingly soluble in water; soluble in boiling water; insoluble in ethanol, chloroform or ether.

Identification (1) Dissolve 0.1 g in 5 ml of water, add 0.5 g of sodium bicarbonate, 0.5 ml of potassium ferricyanide TS and 1 drop of mercury. Shake vigorously for 1 minute and allow to stand for 20 minutes at a temperature above 20°C; a reddish colour develops slowly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piperazine phosphate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of phosphates (Appendix III).

Primary amines and ammonia Dissolve 0.50 g in 10 ml of water and 1.0 ml of 10% sodium hydroxide solution. Add 1.0 ml of acetone and 1.0 ml of sodium nitroprusside TS, mix and allow to stand for exactly 10 minutes. Measure the absorbance of the resulting solution at 520 nm and 600 nm (Appendix IV A), using a blank consisting of the same quantities of the reagents, but using water in place of sodium hydroxide solution. The ratio A_{600}/A_{520} is not greater than 0.50 (equivalent to about 0.7% of primary amines and ammonia).

Water 8.0%-9.5% (Appendix VIII M, method 1 A).

Iron Dissolve 2.0 g in 35 ml of water and 5 ml of hydrochloric acid. Add 50 mg of ammonium persulfate, 3 ml of ammonium thiocyanate solution (30→100) and dilute with water to 50 ml, mix well. Extract the solution with 20 ml of *n*-butanol. Any colour produced in the *n*-butanol layer is not more intense than that of a reference using 1.0 ml of iron standard solution (0.0005%).

Heavy metals Dissolve 2.0 g in 20 ml of water and 4 ml of dilute hydrochloric acid, carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than

Assay Dissolve about 80 mg, accurately weighed, in 4 ml of dehydrated formic acid by warming. Add 50 ml of glacial acetic acid and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 9.207 mg of $C_4H_{10}N_2 \cdot H_3PO_4$.

Category Anthelmintic.

Storage Preserve in tightly closed containers.

Preparation Piperazine Phosphate Tablets

Piperazine Phosphate Tablets

Piperazine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of piperazine phosphate ($C_4H_{10}N_2 \cdot H_3PO_4 \cdot H_2O$).

Description White tablets.

Identification To a quantity of powdered tablets equivalent to about 0.5 g of piperazine phosphate add 20 ml of water, heat and shake well and filter. The filtrate complies with the tests (1) and (3) for Identification described under Piperazine Phosphate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powder equivalent to about 1 g of piperazine phosphate, accurately weighed, in a 100 ml volumetric flask add 90 ml of water, shake thoroughly, dilute with water to volume and mix. Filter, measure accurately 10 ml of the successive filtrate, add 70 ml of trinitrophenol TS, stir and warm until the supernatant liquid is clear. Cool to room temperature, allow to stand for 1 hour, filter through a sintered glass crucible previously dried to constant weight at 105°C, and wash the residue with successive quantities of saturated solution of piperazine trinitrophenol derivative ($C_4H_{10}N_2 \cdot 2C_6H_3N_3O_7$). Dry the residue to constant weight at 105°C and weigh. Each g of residue is equivalent to 0.3714 g of $C_4H_{10}N_2 \cdot H_3PO_4 \cdot H_2O$.

Category As described under Piperazine Phosphate.

Strength (1) 0.2 g (2) 0.5 g

Storage Preserve in tightly closed containers.

Piracetam

Piracetam is 2-oxyl-1-pyrrolidinoacetamide. It contains not less than 98.0% and not more than 102.0% of $C_6H_{10}N_2O_2$, calculated on the dried basis.

Description White or almost white crystalline powder; odourless, taste, slightly bitter. Freely soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Melting range 151-154°C (Appendix III C)

Identification (1) To 0.1 g add several drops of water to dissolve, and add a drop of potassium permanganate TS and sodium hydroxide TS respectively, mix well, a violet colour is produced, turning to blue gradually, and green at last.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution correspondingly.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piracetam (Appendix XIII 185).

Clarity and colour of solution Dissolve 2.0 g in 10 ml of water, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Acidity Dissolve 1.0 g in 20 ml of water, pH 5.0-7.0 (Appendix VI H).

Related substances Prepare test solution of 0.5 mg of piracetam per ml and reference solution of 5 µg of piracetam CRS per ml with the mobile phase. Carry out the chromatography conditions as described under Assay. Inject 10 µl of the reference solution into column. Adjust the sensitivity of the detector so that the principal peak height in the chromatogram is about 10% of the full scale of the recorder. Inject separately 10 µl of above two solutions into column, and record the chromatogram for three times of the retention time of the principal peak. The sum of the areas of all impurity peaks in the chromatogram obtained with test solution is not greater than the principal peak in the chromatogram obtained with reference solution.

Loss on drying When dried to constant weight at 105°C, losses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 25 ml of water. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (10 : 90) as the mobile phase. Detection wavelength is 210 nm, the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of piracetam.

Procedure Dissolve a sufficient quantity, accurately weighed, and dilute with the mobile phase to produce a solution of 0.1 mg of piracetam per ml, inject 10 µl of the solution into the column. Record the peak areas correspondingly obtained in the chromatogram. Repeat the operation, using piracetam CRS instead of the substance being examined, calculate the content of $C_6H_{10}N_2O_2$, with respect to the peak area obtained in the chromatogram by external standard method.

Category Nootropic.

Storage Preserve in tightly closed containers and protected from light.

Preparation (1) Piracetam and Sodium Chloride Injection
(2) Piracetam Capsules
(3) Piracetam Injection
(4) Piracetam Oral Solution
(5) Piracetam Tablets

Piracetam and Sodium Chloride Injection

Piracetam and Sodium Chloride Injection is a sterile solution of Piracetam and Sodium Chloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of piracetam ($C_6H_{10}N_2O_2$) and sodium chloride (NaCl) respectively.

Description A clear, colourless liquid.

Identification (1) To a quantity equivalent to about 0.1 g of piracetam add a drop of potassium permanganate TS and sodium hydroxide TS respectively, mix well, a violet colour is produced, turning to blue gradually, and green at last.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution correspondingly.

(3) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 4.0-7.0 (Appendix VI H).

Related substances Prepare test solution of 0.5 mg of piracetam per ml and reference solution of 5 μ g of piracetam per ml with mobile phase. Inject 10 μ l of the reference solution into column. Carry out the chromatography conditions as described under Assay. Adjust the sensitivity of the detector so that the principal peak height in the chromatogram is about 10% of the full scale of the recorder. Inject separately 10 μ l of above two solutions into column, and record the chromatogram for three times of the retention time of the principal peak. The sum of the areas of all impurity peaks in the chromatogram obtained with the test solution is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution.

Heavy metals To 20 ml add 2 ml of acetate BS pH 3.5 and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.00001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI C): less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Piracetam Dilute a quantity, accurately measured, with mobile phase to produce a solution of 0.1 mg of piracetam per ml. Carry out the method as described under Assay of Piracetam, beginning at the words "inject 10 μ l of the solution into the column".

Sodium chloride To 10 ml of injection, accurately measured, add 30 ml of water, 5 ml of dextrin solution (1 \rightarrow 50), 2 ml of borax solution (2.5 \rightarrow 100) and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/ml) VS. Each ml of silver nitrate (0.1 mol/ml) VS is equivalent to 5.844 mg of NaCl.

Category As described under Piracetam.

Strength 250 ml : 8 g of Piracetam and 2.25 g of Sodium Chloride

Storage Preserve in well closed containers and protected from light.

Piracetam Capsules

Piracetam Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of piracetam ($C_6H_{10}N_2O_2$).

Description Capsules containing a white or almost white granular powder or powder.

Identification (1) To a quantity equivalent to about 0.5 g of piracetam, add 10 ml of water, shake to dissolve and filter, to 2 ml of the filtrate add a drop of potassium permanganate TS and sodium hydroxide TS respectively, mix well, a violet colour is produced, turning to blue gradually, and green finally.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution correspondingly.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately and dissolve a quantity of the mixed contents of capsules obtained in the test for weight variation of content equivalent to 0.1 g of piracetam with mobile phase in a 100 ml volumetric flask, and dilute to volume, mix well and filter, transfer 5 ml of the successive filtrate accurately to a 50 ml volumetric flask and dilute with mobile phase to volume, mix well. Carry out the method as described under Assay of Piracetam, beginning at the words "inject 10 μ l of the solution into the column".

Category As described under Piracetam.

Strength (1) 0.2 g (2) 0.4 g

Storage Preserve in tightly closed containers and protected from light.

Piracetam Injection

Piracetam Injection is a sterile solution of Piracetam in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of piracetam ($C_6H_{10}N_2O_2$).

Description A clear, colourless liquid.

Identification (1) To a quantity equivalent to about 0.1 g of piracetam add a drop of potassium permanganate TS and sodium hydroxide TS respectively, mix well, a violet colour is produced, turning to blue gradually, and green at last.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution correspondingly.

pH value 4.0-7.0 (Appendix VI H).

Related substances Prepare test solution of 0.5 mg of piracetam per ml and reference solution of 5 μ g of piracetam per ml with mobile phase. Carry out the chromatography conditions as described under Assay. Inject 10 μ l of the reference solution into column. Adjust the sensitivity of the detector so that the principal peak height in the chromatogram is about 10% of the full scale of the recorder. Inject separately 10 μ l of above two solutions into column,

and record the chromatogram for three times of the retention time of the principal peak. The sum of the area of all impurity peaks in the chromatogram obtained with test solution is not greater than 1.5 times of the area of the principal peak in the chromatogram obtained with reference solution.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI C): less than 0.0375 EU per 1 mg of piracetam.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Dilute an accurately measured quantity with mobile phase to produce a solution of 0.1 mg of piracetam per ml. Carry out the method as described under Assay of Piracetam, beginning at the words "inject 10 μ l of the solution into the column".

Category As described under Piracetam.

Strength (1) 20 ml : 4 g (2) 5 ml : 1 g

Storage Preserve in well closed containers and protected from light.

Piracetam Oral Solution

Piracetam Oral Solution contains not less than 93.0% and not more than 107.0% of the labelled amount of piracetam ($C_6H_{10}N_2O_2$).

Description A clear, orange yellow to brown yellow liquid; sweet; taste, slightly bitter.

Identification (1) To a quantity equivalent to about 0.5 g of piracetam, add 10 ml of chloroform, shake and allow to separate into two layers; to 3 ml of chloroform solution add 5 drops of potassium permanganate TS and sodium hydroxide TS respectively, shake, a green colour is produced in the upper layer.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution correspondingly.

Relative density Not less than 1.10 (Appendix VI A).

pH value 4.0-6.5 (Appendix VI H).

Related substances Prepare test solution of 0.5 mg of piracetam per ml and reference solution of 5 μ g of piracetam per ml with mobile phase. Carry out the chromatography conditions as described under Assay. Inject 10 μ l of the reference solution into column. Adjust the sensitivity of the detector so that the principal peak height in the chromatogram is about 10% of the full scale of the recorder. Inject separately 10 μ l of above two solutions into column, and record the chromatogram for three times of the retention time of the principal peak. The sum of the areas of all impurity peaks in the chromatogram obtained with test solution is not greater than 1.5 times of the area of the principal peak in the chromatogram obtained with reference solution.

Other requirements Complies with the general requirements for oral solution (Appendix I O).

Assay Dilute a quantity, accurately measured, with mobile phase to produce a solution of 0.1 mg of piracetam per ml. Carry out the method as described under Assay of Piracetam, beginning at the words "inject 10 μ l of the solution into the column".

column".

Category As described under Piracetam.

Strength 10 ml : 0.8 g

Storage Preserve in tightly closed containers and protected from light.

Piracetam Tablets

Piracetam Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of piracetam ($C_6H_{10}N_2O_2$).

Description White or almost white tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 0.5 g of piracetam, add 10 ml of water, shake to dissolve and filter, to 2 ml of the filtrate add a drop of potassium permanganate TS and sodium hydroxide TS respectively, mix well, a violet colour is produced, turning to blue gradually, and green at last.

(2) The retention time of principal peak of piracetam in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of piracetam CRS in the chromatogram of the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powder equivalent to 0.1 g of piracetam with mobile phase in a 100 ml volumetric flask, and dilute to volume, mix well and filter, transfer accurately 5 ml of the successive filtrate to a 50 ml volumetric flask and dilute with mobile phase to volume, mix well. Carry out the method as described under Assay of Piracetam, beginning at the words "inject 10 μ l of the solution into the column".

Category As described under Piracetam.

Strength 0.4 g

Storage Preserve in tightly closed containers and protected from light.

Piroxicam

$C_{15}H_{13}N_3O_4S$ 331.35

[36322-90-4]

Piroxicam is 2-methyl-4-hydroxy-N-(2-pyridyl)-2H-1,2-benzothiazine-3-carboxamide 1,1-dioxide. It contains not less than 98.5% of $C_{15}H_{13}N_3O_4S$, calculated on the dried basis.

Description Almost white or pale yellowish-green crystalline powder; odourless, tasteless. Freely soluble in chloroform; sparingly soluble in acetone; slightly soluble in ethanol or ether; practically insoluble in water; soluble in acid; sparingly soluble in alkali.

decomposition.

Identification (1) Dissolve about 30 mg in 1 ml of chloroform, add 1 drop of ferric trichloride TS; a rose-colour is produced.

(2) The light absorption of a solution of 5 µg per ml in 0.1 mol/L methanolic hydrochloric acid solution exhibits two maxima at 243 nm and 334 nm respectively. (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of piroxicam (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ [a mixture of 0.5% sodium carboxy methyl cellulose solution with 1 mol/L sodium hydroxide solution (1 : 1) as the binder] as the coating substance and a mixture of chloroform-acetone-methanol (25 : 25 : 5) as the mobile phase. Apply separately to the plate 10 µl of each of two solutions in chloroform containing (1) 20 mg per ml, (2) 0.2 mg per ml of the substance being examined. After developing and removed of the plate, dry it in air, examine under an ultraviolet light (254 nm); any spot, other than the principal spot, obtained in chromatogram of solution (1) is not more intense than the principal spot obtained in chromatogram of solution (2).

Chlorides Spread 2 g of anhydrous sodium carbonate on the bottom and around of a crucible, place 1.0 g on the anhydrous sodium carbonate, moisten with water, after drying, heat gently until it is completely incinerated, cool. Add a quantity of water to dissolve, filter, wash the crucible and filter with water. Combine the filtrate and washings, add water to produce 20 ml, mix well. Measure 1 ml of the filtrate, neutralize by adding nitric acid dropwise, then add 1 drop of nitric acid, mix well. Heat in a 75-85°C water bath to expel hydrogen sulfide thoroughly. Allow to cool, neutralize by adding 1% sodium carbonate solution dropwise, add water to produce 25 ml, carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.1%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic To 10 ml of the remained solution obtained in the test for chloride add 5 ml of hydrochloric acid and 13 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0004%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 33.14 mg of C₁₅H₁₃N₃O₄S.

Category Antipyretic and analgesic non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Piroxicam Capsules

(4) Piroxicam Ointment

(5) Piroxicam Tablets

Piroxicam Capsules

Piroxicam Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of piroxicam (C₁₅H₁₃N₃O₄S).

Identification A quantity of the contents of capsules complies with the tests for Identification (1), (2) as described under Piroxicam tablets.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix the contents obtained in the test for weight variation of contents, carry out the Assay as described under piroxicam tablets, beginning at the words "Weigh accurately a quantity, equivalent to about 10 mg of piroxicam..."

Category, Storage As described under piroxicam.

Strength (1) 10 mg (2) 20 mg

Piroxicam Gel

Piroxicam Gel contains not less than 90.0% and not more than 110.0% of the labelled amount of Piroxicam (C₁₅H₁₃N₃O₄S).

Description A yellow-green gel.

Identification (1) To a little of the gel add 1 drop of ferric chloride TS, stir well, a rose red colour is produced.

(2) The light absorption of the test solution obtained from assay exhibits maxima at 252 nm, 286 nm and 353 nm.

Acidity or alkalinity Dissolve a quantity of the gel in freshly boiled and cooled water to produce an 1% emulsion of piroxicam, pH 7.0-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for gel (Appendix I U).

Assay Transfer about 2 g, rapidly accurately weighed, to a beaker. Add a quantity of borate-potassium chloride BS (pH 9.0), stir well to disperse the gel, add borate-potassium chloride BS with stirring to dissolve piroxicam, transfer it to a 100 ml volumetric flask, wash the container with borate-potassium chloride BS. Transfer the washings to the same volumetric flask, dilute with the same solvent to volume, shake thoroughly and filter. Transfer 5 ml of the successive filtrate, accurately measured, in a 50 ml volumetric flask, dilute to volume with borate-potassium chloride BS, mix well. Dissolve a quantity of Piroxicam CRS, accurately weighed, in borate acid-potassium chloride BS (pH 9.0) to produce a solution of 10 µg per ml. Filter the two resulting solutions through a membrane with pores of 0.8 µm in diameter, and measure the absorbances of the two filtrates at 353 nm respectively, calculate the content of C₁₅H₁₃N₃O₄S.

Category As described under Piroxicam.

Strength 10 g : 50 mg

Storage Preserve in tightly closed containers, stored in a cool place, protected from light.

Piroxicam Injection

Piroxicam Injection is a sterile solution of Piroxicam and suitable auxiliary solvent in water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of Piroxicam ($C_{15}H_{13}N_3O_4S$).

Description A clear, light yellowish-green liquid.

Identification (1) To a quantity of the injection add 1 mol/L hydrochloric acid solution to acidify. Extract with chloroform by shaking, to the chloroform layer, add 1 drop of ferric trichloride TS; a rose-red colour is produced gradually.

(2) To a few drops of chloroform extract obtained in test for Identification (1) add bromine TS until the yellow colour keeps lasting, then add saturated solution of sulfosalicylic acid, until the yellow colour fades, add a quantity of 5% potassium iodide solution and several drops of starch IS, a blue colour is produced.

pH value 8.5-9.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately a quantity of the injection equivalent to about 0.2 g of Piroxicam to a separator, acidify with 2 ml of 1 mol/L hydrochloric acid solution. Extract with chloroform for 4 times, using 75 ml initially, then with 25 ml each. Combine the chloroform extracts, wash with water twice, 2 ml each. Discard the washing solution and evaporate the chloroform extract on a water bath to dryness, then dry the residue at 105°C for 3 hours. Dissolve the residue with 30 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination to make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 33.13 mg of $C_{15}H_{13}N_3O_4S$.

Category As described under piroxicam.

Strength 2 ml : 20 mg

Storage Preserve in well closed containers, protected from light.

Piroxicam Ointment

Piroxicam Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of piroxicam ($C_{15}H_{13}N_3O_4S$).

Description A pale-yellow ointment.

Identification (1) To a quantity of the ointment equivalent to about 40 mg of piroxicam, add 10 ml of chloroform, heat to melt on a water bath at 70°C. Allow to cool in ice bath, filter, add 1 drop of ferric chloride TS to the filtrate; a rose red colour is produced.

(2) The light of absorption of the solution obtained in Assay exhibits two maxima at 243 nm and 334 nm (Appendix IV A).

Other requirements Complies with the general requirements for ointment (Appendix I F).

ointment equivalent to about 10 mg of piroxicam to a 100 ml beaker, add 30 ml of 0.01 mol/L methanolic hydrochloric acid solution, stir on a water bath at 70°C, extract for 10 min, allow to cool in an ice bath to freeze the ointment base and filter. Transfer the filtrate to a 100 ml volumetric flask, extract the residue as described above twice more. Combine the extracts, dilute with 0.01 mol/L methanolic hydrochloric acid solution to volume, mix well. Measure the absorbance of the resulting solution at 334 nm (Appendix IV A). Calculate the content of $C_{15}H_{13}N_3O_4S$, taking 856 as the value of A (1%, 1 cm).

Category As described under piroxicam.

Strength (1) 10 g : 0.1 g (2) 20 g : 0.2 g

Storage Preserve in tightly closed containers, stored in a cool place.

Piroxicam Tablets

Piroxicam Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Piroxicam ($C_{15}H_{13}N_3O_4S$).

Description Almost white pale yellowish-green tablets or sugar coated tablets, with an almost white or pale yellowish-green core.

Identification (1) Shake a quantity of the powdered tablets, with the sugar coat removed, equivalent to about 40 mg of piroxicam with 10 ml of chloroform to dissolve piroxicam and filter. The filtrate complies with the tests for Identification (1) described under Piroxicam.

(2) The light absorption of a solution obtained in the Assay exhibits maxima at 243 nm and 334 nm (Appendix IV A).

Dissolution Carry out the method for dissolution test (Appendix X C, method 2), using 900 ml hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution at 40 minutes and filter. Measure accurately 3 ml of the successive filtrate to a 10 ml (for strength 20 mg) or 5 ml (for strength 10 mg) volumetric flask, dilute with dissolution medium to volume, mix well. Weigh accurately a quantity of piroxicam CRS, dilute with dissolution medium to produce a solution of 6 µg per ml. Measure the absorbances of two solutions at 335 nm (Appendix IV A) and calculate the dissolution of piroxicam from each tablet. The dissolution of piroxicam is not less than 70% of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets, with sugar coat removed. Weigh accurately a quantity of the powder equivalent to about 10 mg of piroxicam in 100 ml volumetric flask, dilute with 0.1 mol/L methanolic hydrochloric acid solution to volume, mix well and filter. Discard the initial filtrate, measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute with 0.1 mol/L methanolic hydrochloric acid solution to volume, mix well. Measure the absorbance of the resulting solution at 334 nm (Appendix IV A), calculate the content of $C_{15}H_{13}N_3O_4S$, taking 856 as the value of A (1%, 1 cm).

Category As described under Piroxicam.

Strength (1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers, protected

Pizotifen

$C_{19}H_{21}NS$ 295.45

[15574-96-6]

Pizotifen is 1-methyl-4-(9,10-dihydro-4*H*-benzo [4,5]-cyclohepta [1,2-*b*]-thiophen-4-ylidene)-piperidine. It contains not less than 98.5% of $C_{19}H_{21}NS$, calculated on the dried basis.

Description An almost white crystalline powder; odourless; taste, bitter. Freely soluble in chloroform; sparingly soluble in ethanol; insoluble in water.

Melting range 147-152°C (Appendix VI C).

Specific absorbance Dissolve an accurately weighed quantity in hydrochloric acid solution (0.9 → 1000) to produce a solution of 10 µg per ml. Measure the absorbance at 230 nm, the value of *A* (1%, 1 cm) is 582-618 (Appendix IV A).

Identification (1) To about 5 mg add 1 drop of sulfuric acid, a reddish-brown colour is produced, which disappears on adding 1 ml of water.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of pizotifen (Appendix XVI).

(3) Carry out the method for oxygen flask combustion (Appendix VII C), using 5 ml of 5% sodium hydroxide solution and 1 ml of concentrated hydrogen peroxide solution as the absorbing liquid. When the combustion is complete, acidify with dilute hydrochloric acid, the solution yields the reactions characteristic of sulfates (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance, a mixture of butanol-acetic acid-water (4 : 1 : 5) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in ethanol containing (1) 10 mg per ml (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, visualize in iodine vapour. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.54 mg of $C_{19}H_{21}NS$.

Category Used in treatment of migraine.

Storage Preserve in tightly closed containers, protected

Preparation Pizotifen Tablets

Pizotifen Tablets

Pizotifen Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of pizotifen ($C_{19}H_{21}NS$).

Description Sugar coated tablets with white core.

Identification To a quantity of the powdered tablets with the coating removed equivalent to about 20 mg of pizotifen, add 20 ml of chloroform, shake well, separate the chloroform layer and filter. Evaporate the filtrate to dryness. The residue complies with tests (1) and (3) for Identification described under pizotifen.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with the coating removed with about 40 ml of 0.01 mol/L hydrochloric acid solution in portions and transfer to a 50 ml volumetric flask. Shake thoroughly, dilute with the same solvent to volume, mix well and filter. Proceed as described under Assay.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 3), using 100 ml of hydrochloric acid solution (9 → 1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution at 45 minutes and filter, the successive filtrate as test solution. Dissolve pizotifen CRS in the dissolution medium to produce a solution of about 5 µg per ml. Measure the absorbance of the resulting solutions at 230 nm (Appendix IV A). Calculate the dissolution of $C_{19}H_{21}NS$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. To an accurately weighed quantity of the powdered tablets equivalent to 5 mg of pizotifen, accurately weighed, in a 100 ml volumetric flask. Add 70 ml of 0.01 mol/L hydrochloric acid solution, shake well, dilute to volume with 0.01 mol/L hydrochloric acid solution, mix well and filter. Transfer 10 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute to volume with 0.01 mol/L hydrochloric acid solution, mix well. Measure the absorbance at 230 nm (Appendix IV A). Calculate the content of $C_{19}H_{21}NS$, taking 600 as the value of *A* (1%, 1 cm).

Category As described under Pizotifen.

Strength 0.5 mg

Storage Preserve in tightly closed containers, protected from light.

Polymyxin B Sulfate

Polymyxin B Sulfate is the sulfate salt of a kind of polymyxin has a potency of not less than 6500 Polymyxin B Unit per mg, calculated on the dried basis.

Description White or almost white powder; practically odourless; hygroscopic.

Specific optical rotation -78° to -90° , in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 2 mg in 5 ml of water and add 5 ml of 10% sodium hydroxide solution. Shake and add dropwise 0.25 ml of 1% copper sulfate solution, shaking after each addition. A reddish-violet colour develops.

(2) **Test solution** Dissolve 5 mg of the substance to be examined in 1 ml of a mixture of equal volumes of hydrochloric acid and water. Heat at 135°C in a sealed tube for 5 hours. Evaporate to dryness on a water-bath and continue the heating until the hydrochloric acid has evaporated. Dissolve the residue in 0.5 ml of water.

Reference solution (a) Dissolve leucine in water to produce a solution of about 2 mg per ml.

Reference solution (b) Dissolve threonine in water to produce a solution of about 2 mg per ml.

Reference solution (c) Dissolve phenylalanine in water to produce a solution of about 2 mg per ml.

Reference solution (d) Dissolve serine in water to produce a solution of about 2 mg per ml.

Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of phenol-water (75 : 25) as the mobile phase (leave the plate to become impregnated with the vapour of the solvent for at least 12 hours). Apply separately to the plate 5 μl each of five solutions above. Dry it at $100-105^{\circ}\text{C}$ and spray with ninhydrin solution. Heat at 110°C . The chromatogram obtained with the test solution shows bands corresponding to those in the chromatograms obtained with reference solutions (a), (b) and (c), but shows no band corresponding to that in the chromatograms obtained with reference solution (d). The chromatogram obtained with the test solution also shows a band with a very low R_f value.

(3) It gives reaction of sulfate (Appendix III).

Acidity An aqueous solution of 20 mg per ml, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution Dissolve 5 portions each in water to produce solutions of about 50000 Units per ml, the solutions are clear and colourless (Appendix IX B, IX A).

Phenylalanine Dissolve a quantity, accurately weighed, in 0.1 mol/L hydrochloric acid solution and dilute to 0.4 g per ml with the same solvent. Measure the absorbances (Appendix IV A) at the maxima at 264 nm (A_{264}), 258 nm (A_{258}) and 252 nm (A_{252}) and the absorbances at 300 nm (A_{300}) and 280 nm (A_{280}), calculate the percentage content of phenylalanine from the expression:

$$\frac{9.4787/[W(A_{258} - 0.5 A_{252} + 0.5 A_{264} - 1.8 A_{280} + 0.8 A_{300})]}{100}$$

W: test weight (g)

A: absorbance

Phenylalanine is 9%-12%, calculated on the dried basis.

Loss on drying Not more than 6.0%, when dried at 60°C over diphosphorus pentoxide for 3 hours (Appendix VIII L).

Residue on ignition Not more than 0.75% (Appendix VIII N), using 1.0 g.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 20000 Units per ml in sterile water for injection per kg of rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), using no less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of about 10000 Units per ml, carry out the Microbiological Assay of Antibiotics

to 1 mg of Polymyxine B.

Category Polypeptide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Polymyxine B sulfate for injection.

Polymyxine B Sulfate for Injection

Polymyxine B Sulfate for Injection is a sterile powder of polymyxine B sulfate. It has a potency of no less than 6500 Polymyxine B Units per mg, calculated on the dried basis. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of polymyxine B, calculated on the basis of the average weight of contents.

Description A white or almost white powder.

Identification Complies with the tests for Identification described under Polymyxine B Sulfate.

Clarity and colour of solution Dissolve 5 portions each in water to produce solutions of about 50000 Polymyxine B Sulfate Units per ml, the solutions are clear and colourless (Appendix IX B, IX A).

Loss on drying Not more than 7.0%, by decompressed-drying at 60°C over diphosphorus pentoxide for 3 hours (Appendix VIII L).

Acidity, Pyrogens, Sterility Complies with the corresponding requirement described under Polymyxine B Sulfate.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay description under Polymyxine B Sulfate, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of the contents.

Category As described under Polymyxine B Sulfate.

Strength 500000 Units

Storage Preserve in well closed containers, stored in a dry place.

Poppy Capsule Extractive

Poppy Capsule Extractive is extracted from the capsule of *Papaver somniferum* L., dried and prepared by addition of dried powder of the poppy capsule. It contains not less than 11.0% of morphine, calculated with reference to anhydrous morphine ($\text{C}_{17}\text{H}_{19}\text{NO}_3$).

Description A pale brown powder; odour, characteristic; taste, bitter.

Identification (1) Shake about 0.1 g with 5 ml of 5% acetic acid solution for 2 minutes, add a quantity of ammonia concentrated TS to adjust pH to about 9. Extract with 10 ml a mixture of chloroform-ethanol (9 : 1), transfer the organic layer and evaporate to dryness on a water bath. Add potassium ferricyanide dilute TS to the residue, a blue-green

(2) Shake about 0.1 g with 2 ml water and a few drops of ammonia TS and 10 ml chloroform for 10 minutes. Transfer the chloroform layer and evaporate to dryness on a water bath. Add 2 drops of formaldehyde-sulfuric acid TS to the residue, a deep red colour is produced immediately.

(3) Transfer about 25 mg into a conical flask, add 5 ml of 5% acetic acid solution, in ultrasonic bath for 5 minutes to dissolve morphine and filter. Adjust the filtrate to pH about 10 with ammonia concentrated TS, extract with 10 ml a mixture of chloroform-ethanol (9 : 1). Transfer the organic layer and evaporate in vacuum to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of morphine CRS in methanol to produce a solution of 1.0 mg morphine per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (85 : 10 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of the above two solutions, after developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with the test solution corresponds in colour and position to the principal spot obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (5 : 5 : 2) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test of solid phase extraction column

Using a solid phase extraction column packed with octadecylsilane bonded silica gel. Carry out the test as described under the Procedure. Transfer 0.5 ml of a solution in 5% acetic acid solution containing 0.5 mg of morphine CRS per ml, accurately measured, to the column pretreated, collect the eluate into a 5 ml volumetric flask to volume and mix well. Respectively inject 10 μ l of the eluate and the reference solution as described under the Procedure into the column, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak area of morphine obtained in the chromatogram of the eluate to that of the reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH about 9 (add drops of ammonia TS to a quantity of water until the pH value is about 9) until the pH value of the eluate is about 9. Triturate about 10 g of the substance being examined (let it through No. 5 sieve). Transfer about 1 g, accurately weighed, into a 200 ml volumetric flask, add a quantity of 5% acetic acid solution, in ultrasonic bath for 30 minutes to dissolve morphine, cool and dilute to volume with 5% acetic acid solution, mix well and filter. Measure accurately 0.5 ml of the successive filtrate to the above washed column, drop a quantity of ammonia TS to adjust pH of the solution in the column to about 9 (defined the quantity of ammonia TS by using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution containing 10% of methanol, collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate into the column, record the chromatogram. Repeat the operation, using a solution of 0.05 mg of

of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Storage Preserve in tightly closed containers.

Powdered Poppy Capsule Extractive

Powdered Poppy Capsule Extractive is Poppy Capsule Extractive dried at a temperature below 70°C, reduced to fine powder and prepared by the addition of codeine phosphate or other diluents after determining the content of morphine. It contains not less than 9.5% and not more than 10.5% of morphine, calculated with reference to anhydrous morphine ($C_{17}H_{19}NO_3$), it contains not less than 4.5% of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$).

Description A light brown powder; odour, characteristic; taste, bitter.

Identification (1) Complies with the tests (1) and (2) for Identification described under Poppy Capsule Extractive.

(2) Transfer about 25 mg into a conical flask, add 5 ml of 5% acetic acid solution, in ultrasonic bath for 5 minutes to dissolve morphine and filter. Adjust the filtrate to pH about 10 with concentrated ammonia TS, extract with 10 ml a mixture of chloroform-ethanol (9 : 1). Transfer the organic layer and evaporate in vacuum to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve each a quantity of morphine CRS and codeine phosphate CRS in methanol to produce a solution of 1.0 mg morphine and 1.0 mg codeine phosphate per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (85 : 10 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of the above two solutions, after developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with the test solution corresponds in colour and position to the principal spot obtained with the reference solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (5 : 5 : 2) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is more than 1000, calculated with reference to the peak of morphine. The resolution factor between peak areas of morphine and codeine complies with related requirements.

System suitability test of solid phase extraction column

Using a solid phase extraction column packed with octadecylsilane bonded silica gel. Carry out the test as described under the Procedure. Transfer 0.5 ml of a solution in 5% acetic acid solution containing 0.5 mg of morphine CRS per ml, accurately measured, to the column pretreated, collect the eluate into a 5 ml volumetric flask to volume and mix well. Respectively inject 10 μ l of the eluate and the reference solution as described under the Procedure into the column, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak area of morphine obtained in the chromatogram of the eluate to that of the reference solution is

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH about 9 (add drops of ammonia TS to a quantity of water until the pH value is about 9) until the pH value of the eluate is about 9. Triturate about 10 g of the substance being examined (let it through No. 5 sieve). Transfer about 1 g, accurately weighed, into a 200 ml volumetric flask, add a quantity of 5% acetic acid solution, in ultrasonic bath for 30 minutes to dissolve morphine, cool and dilute to volume with 5% acetic acid solution, mix well and filter. Measure accurately 0.5 ml of the successive filtrate to the above washed column, drop a quantity of ammonia TS to adjust pH of the solution in the column to about 9 (defined the quantity of ammonia TS by using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution containing 10% of methanol, collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate into the column, record the chromatogram. Repeat the operation, using a solution of 0.05 mg of morphine CRS and 0.025 mg of codeine phosphate per ml in 5% acetic acid solution containing 10% of methanol instead of the eluate. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Storage Preserve in tightly closed containers.

Posterior Pituitary Injection

Posterior Pituitary Injection is a sterile solution of powdered posterior pituitary in dilute acetic acid solution. It contains not less than 87% and not more than 115% of the labelled potency of vasopressin, calculated on vasopressin.

Description A colourless, clear or almost clear liquid.

pH Value 3.0-4.0 (Appendix VI H).

Oxytocin Carry out the biological assay of oxytocin (Appendix XII F), the ratio of potency of oxytocin to that of vasopressin is not more than 1 : 0.6.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay vasopressin Carry out the biological assay of vasopressin (Appendix XII A), complies with the requirement of Posterior Pituitary Injection.

Strength Calculated on vasopressin
(1) 0.5 ml : 3 units (2) 1 ml : 6 units

Storage Preserve in well closed containers, stored in a cool place, protected from light.

Powdered Posterior Pituitary

Powdered Posterior Pituitary is prepared by dehydrating, drying and powdering of the posterior lobe of the pituitary body of healthy porcine, sheep and bovine animals. It contains not less than 0.6 unit of vasopressin per mg, calculated on the dried basis. The ratio of potency of vasopressin to that of oxytocin

Description A white to pale yellow powder. Odour characteristic. Practically insoluble in water.

Oxytocin Carry out the biological assay of oxytocin (Appendix XII F). The ratio of potency of oxytocin to that of vasopressin is not more than 1 : 0.6.

Assay Carry out the biological assay of vasopressin (Appendix XII O). It contains not less than 85% and not more than 120% of the labelled potency.

Category Vasoconstrictor and antidiuretic.

Storage Preserve in tightly closed containers stored in a cold place.

Preparation Posterior Pituitary Injection

Potassium Chloride

KCl 74.55 [7447-40-7]

Potassium Chloride contains not less than 99.5% of KCl, calculated on the dried basis.

Description Colourless, elongated prismatic or cubic crystals or a white crystalline powder; odourless; taste, saline and astringent. Freely soluble in water; insoluble in ethanol or ether.

Identification Yields the reactions characteristic of potassium salts and chlorides (Appendix III).

Acidity or alkalinity Dissolve 5.0 g in 50 ml of water, add 3 drops of phenolphthalein IS. No colour is produced. Add 0.30 ml of sodium hydroxide (0.02 mol/L) VS, a pink colour is produced.

Clarity of solution Dissolve 2.5 g in 25 ml of water, the solution is clear.

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.010%).

Sodium Introduce a solution (1→5) held on a platinum wire into a nonluminous flame, the flame is not imparted with a pronounced and persistent yellow colour.

Manganese Dissolve 2.0 g in 8 ml of water, add 2 ml of sodium hydroxide TS, mix well and allow to stand for 10 minutes, no colour is produced.

Iodide, Bromide, Barium, Calcium, Magnesium and Iron Carry out the respective tests described under Sodium Chloride, it complies with the requirements.

Loss on drying When dried at 130°C to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 4.0 g in 20 ml of water, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay Dissolve about 0.15 g, accurately weighed, in 50 ml of water, add 5 ml of dextrin solution (1→50) and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 7.455 mg of KCl.

Storage Preserve in tightly closed containers.

Preparation (1) Potassium Chloride Injection
(2) Potassium Chloride Sustained-release Tablets
(3) Potassium Chloride Tablets

Potassium Chloride Injection

Potassium Chloride Injection is a sterile solution of Potassium Chloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of potassium chloride (KCl).

Description A clear, colourless liquid.

Identification Yields the reactions characteristic of potassium salts and chlorides (Appendix III).

pH value 5.0-7.0 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.118 EU per mg of Potassium Chloride.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute 10 ml, accurately measured, with water to produce 100 ml, mix well. Measure accurately 10 ml of the diluted solution, add 40 ml of water, 5 ml of dextrin solution (1→5) and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 7.455 mg of KCl.

Category As described under Potassium Chloride.

Strength (1) 10 ml : 1 g (2) 10 ml : 1.5 g

Storage Preserve in well closed containers.

Potassium Chloride Sustained-release Tablets

Potassium Chloride contain not less than 93.0% and not more than 107.0%.

Description Sugar-coated with white core.

Identification Powder the tablets with the sugar coating removed. Dissolve a quantity of the powder with water, filter, the filtrate yields the reactions characteristic of potassium salts and chlorides (Appendix III).

Drug release Carry out the drug release test (Appendix X D, method 1), using the apparatus described under dissolution test method 2 and 900 ml of water as the dissolution medium, adjust the rotational speed to 50 rpm. Withdraw each 25 ml of the solution after exactly 2, 4 and 8 hours, respectively, add 25 ml of water to the vessel to compensate the volume. Measure accurately 20 ml of the successive filtrate, dilute with 4 drops of Potassium Cyanide TS and titrate with silver nitrate (0.01 mol/L) VS until the solution becomes orange. Each ml of silver nitrate (0.01 mol/L) VS is equivalent to 0.7455 mg of KCl. The amount of KCl dissolved in 2, 4 and 8 hours is 10%-35%, 30%-70% and not less than 80% of the labelled amount respectively.

Assay Reference preparation When dried to the constant weight at 105°C for 2 hours, dissolve about 0.25 g of Potassium Chloride, accurately weighed, in a 250 ml volumetric flask with water and dilute to volume, mix well.

Measure accurately 5 ml to a 100 ml volumetric flask, dilute to volume with 1% hydrochloric acid solution (g/g) and mix well.

Test preparation Weigh accurately and powder 10 tablets with sugar coating removed, dried to the constant weight in Silica gel drying chamber for 24 hours, accurately weighed, transfer a quantity equivalent to about 0.5 g of Potassium Chloride to a 500 ml volumetric flask, dissolve and dilute to volume with water.

Procedure Transfer accurately 2.0 ml, 3.0 ml, 4.0 ml, 5.0 ml and 6.0 ml of reference preparation into a 100 ml volumetric flask, respectively. Add 2.0 ml of 20% sodium chloride solution in each flask and dilute with 1% hydrochloric acid (g/g) solution to volume, mix well. Transfer accurately 2 ml of the test preparation in a 50 ml of volumetric flask, add 2.0 ml of 20% sodium chloride solution, and dilute with 1% hydrochloric acid (g/g) solution to volume, mix well. Carry out the method for atomic absorption spectrophotometry (Appendix IV D), measure the absorption of above solutions at 766.5nm, with 20% sodium chloride solution; 1% hydrochloric acid (g/g) (2 : 98) as the blank solution and calculate the content of potassium chloride.

Category As described under Potassium Chloride.

Strength 5 g

Storage Preserve in tightly closed container, protected from light.

Potassium Chloride Tablets

Potassium Chloride Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of Potassium Chloride (KCl).

Description White tablets or sugar coated tablets or film tablets with white core.

Identification Dissolve a quantity of the powdered tablets with water, filter, the filtrate yields the reactions characteristic of potassium salts and chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Dissolve a quantity equivalent, to about 0.15 g of potassium chloride, accurately weighed, in 50 ml of water, add 5 ml of 2% dextrin solution and 5-8 drops of fluorescein IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 7.455 mg of Potassium Chloride.

Category As described under potassium chloride.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers, stored in dry place.

Potassium Citrate

$C_6H_5K_3O_7 \cdot H_2O$ 324.41

[866-84-2]

Potassium Citrate is 2-hydroxy-1,2,3-propanetricarboxylic acid-tripotassium salt, monohydrate. It contains not less than 99.0% of $C_6H_5K_3O_7 \cdot H_2O$.

Description White, granular crystals or a crystalline powder; odourless; taste, salty and cool; slightly hygroscopic. Very soluble in water or glycerin; practically insoluble in ethanol.

Identification Yields the reaction characteristic of potassium salts and citrates (Appendix III).

Acidity or alkalinity Dissolve 2.0 g in 25 ml of water, add 1 drop of thymol blue IS. If the solution is blue, add 0.20 ml of hydrochloric acid (0.1 mol/L) VS, the solution becomes yellow; if the solution is yellow, add 0.20 ml of sodium hydroxide (0.1 mol/L) VS, the solution becomes blue.

Chlorides Carry out the limit test for chlorides (Appendix VII A), using 0.20 g. Any opalescence produced is not more intense than that of a reference using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 0.20 g. Any opalescence produced is not more intense than that of a reference using 3.0 ml of potassium sulfate standard solution (0.15%).

Readily carbonizable substances To 0.50 g add 5 ml of sulfuric acid [containing 94.5%-95.5% (g/g) of H_2SO_4], heat on a water bath for 1 hour and cool immediately. Carry out the limit test for readily carbonizable substances (Appendix VIII O). Any colour produced is not more intense than that of a reference (mix 0.5 ml of standard cobaltous chloride CS and 4.5 ml of standard potassium dichromate CS).

Oxalate Dissolve 1.0 g in a mixture of 1 ml of water and 3 ml of dilute hydrochloric acid, add 4 ml of 90% ethanol and 4 drops of calcium chloride TS, allow to stand for 1 hour; no opalescence is produced.

Heavy metals Dissolve 2.0 g in 10 ml of water, add 5 ml of dilute hydrochloric acid and sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 1.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay To about 80 mg, accurately weighed, add 20 ml of glacial acetic acid and 2 ml of acetic anhydride, heat to dissolve and cool to room temperature. Add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.81 mg of $C_6H_5K_3O_7 \cdot H_2O$.

Storage Preserve in tightly closed containers.

Potassium Dehydroandrographolide Succinate

$C_{28}H_{35}KO_{10}$ 570.68

Potassium Dehydroandrographolide Succinate is monopotassium 14-dehydro-11,12-didehydroandrographolide-3,19-disuccinate. It contains not less than 98.0% of $C_{28}H_{35}KO_{10}$, calculated on the dried basis.

Description An almost white or slightly yellow crystalline powder; odourless; taste, bitter; hygroscopic. Soluble in dilute ethanol; practically insoluble in chloroform or ethanol, soluble in 1% sodium bicarbonate solution.

Identification (1) Dissolve 2 mg in 1 ml of dilute ethanol, add two drops of 1.5% 3,5-dinitrobenzoic acid in ethanol and 2 drops of 2 mol/L sodium hydroxide solution, mix well, a violet-red colour is produced.

(2) The light absorption of a solution obtained in Assay exhibits a maximum at 251 nm (Appendix IV A).

(3) Yields the reaction for identification (1) characteristic of potassium salts (Appendix III).

Clarity and colour of solution in dilute ethanol Dissolve 0.1 g in 10 ml of dilute ethanol, the solution is clear and colourless; any colour produced is not more intense than that of reference solution Y_2 or YG_2 (Appendix IX A, method 1).

Loss on drying When dried over phosphorous pentoxide to constant weight at 60°C, loses not more than 3.0% of its weight (Appendix VII L).

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce solutions of 0.4 mg per ml (solution 1) and 8 µg per ml (solution 2). Carry out the method described under Assay, inject 10 µl of the solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% of the full scale of the chart, then inject separately 10 µl of each of solution (1) and solution (2) into the column, and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Insoluble matter in alkali Dissolve 1.0 g in 50 ml of 0.6% sodium bicarbonate solution by heating on a water bath at 70°C. Allow to cool, and filter through a tared sintered-glass filter (No. 3), previously dried to constant weight at 105°C. Wash the residue with 10 ml of 0.6% sodium bicarbonate solution in portions, then wash with 50 ml of water in portions, dry to constant at 105°C. The residue

Pyridine Dissolve 1 g, accurately weighed, in 5 ml of water and 0.3 ml of concentrated ammonia solution in a 10 ml volumetric flask, dilute with water to volume and mix well as the test solution. Prepare a reference solution by dissolving a quantity of pyridine CRS with the same solvents to produce a solution of 20 µg per ml. Carry out the method for residual solvents (Appendix VIII P, method 3), using a column packed with porous polymer beads with 0.25-0.18 mm in diameter containing diethylenebenzene-ethylenebenzene as the stationary phase, maintain the column temperature at 180°C and the FID temperature at 200°C. The number of theoretical plates of the column is not less than 1000, calculated with reference to pyridine. Inject separately 10 µl of each of the resulting solutions into the column, and record the chromatogram. The content of pyridine is not more than 0.02% calculated with respect to the peak area obtained in the chromatogram by the external standard method.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 20 mg per ml in sterile 1% sodium bicarbonate solution free from pyrogens per kg of rabbit's weight.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05% potassium dihydrogen phosphate solution (adjust to pH 2.5 ± 0.05 with phosphoric acid)-methanol (3 : 7) as the mobile phase. Detection wavelength is 251 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of dehydroandrographolide succinate.

Procedure Dissolve about 10 mg, accurately weighed, in the mobile phase in a 100 ml volumetric flask, dilute to volume, and mix well. Inject 10 µl into the column, and record the chromatogram. Repeat the operation, using dehydroandrographolide succinate CRS instead of the substance being examined, calculate the content of $C_{28}H_{35}O_{10}$ with respect to the area obtained in the chromatogram by the external standard method, multiplied by 1.072.

Category Antivirus.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Preparation Potassium Dehydroandrographolide Succinate for Injection

Potassium Dehydroandrographolide Succinate for Injection

Potassium Dehydroandrographolide Succinate for Injection is the sterile lyophilized mass containing potassium dehydroandrographolide succinate with a quantity of sodium bicarbonate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_{28}H_{35}KO_{10}$, calculated with reference to the average amount.

Description A white or slightly yellow frozen mass or powder.

Identification (1) Dissolve 2 mg in dilute ethanol, add 2 drops of 1.5% 3,5-dinitrobenzoic acid in ethanol and 2 drops of 2 mol/L sodium hydroxide solution, mix well, a violet-red colour is produced.

(2) The light absorption of a solution of 25 µg per ml in

(3) Yields the reaction for identification (1) characteristic of potassium salts and for identification (1) characteristic of sodium salts (Appendix III).

Acidity or alkalinity An aqueous solution of 10 mg per ml, pH 6.5-8.0 (Appendix VI H).

Colour of solution A solution of 10 mg per ml in water is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Related substances Carry out the method described under Assay. Dissolve a quantity of the mixed contents obtained in weight variation in mobile phase to produce solutions of 0.4 mg per ml (solution 1) and 8 µg per ml (solution 2). Inject 10 µl of the solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% of the full scale of the chart. Inject separately 10 µl of each of solution (1) and solution (2) into the column, and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried over phosphorous pentoxide to constant weight at 60°C, loses not more than 5.0% of its weight (Appendix VIII L).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 20 mg per ml in sterile Water for Injections per kg of rabbit's weight.

Other requirements Complies with the general requirements for Injection (Appendix I B).

Assay Carry out the method described under Assay of potassium dehydroandrographolide succinate. Dissolve a quantity of the mixed contents obtained in weight variation equivalent to 10 mg of potassium dehydroandrographolide succinate, accurately weighed, in the mobile phase in a 100 ml volumetric flask, dilute to volume, and mix well. Inject 10 µl into the column, and record the chromatogram. Repeat the operation, using dehydroandrographolide succinate CRS instead of the substance being examined, calculate the content of $C_{28}H_{35}O_{10}$ with respect to the area obtained in the chromatogram by the external standard method, multiplied by 1.072.

Category As described under Potassium dehydroandrographolide succinate.

Strength (1) 20 mg (2) 40 mg (3) 100 mg
(4) 200 mg

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Potassium Glutamate Injection

Potassium Glutamate Injection is a sterile solution of glutamic acid with a quantity of potassium hydroxide in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of potassium glutamate ($C_5H_8KNO_4$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Dilute 1 drop with 2 ml of water, add about 2 mg of ninhydrin and heat, the solution exhibits a blue to lavender blue colour.

(2) Yields the reactions characteristic of potassium salts

Colour Not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

pH value 7.5-8.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.012 EU per mg of potassium glutamate.

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Measure accurately 15 ml to a 50 ml volumetric flask, add 10 ml of hydrochloric acid, dilute with water to volume and mix well. Carry out the determination of the optical rotation (Appendix VI E) and multiply by 6.557 to obtain the amount (g) of C₅H₈KNO₄ per 100 ml.

Category As described under Glutamic acid.

Strength 20 ml : 6.3 g

Storage Preserve in well closed containers, protected from light.

Potassium Iodate

KIO₃ 214.00

Potassium Iodate contains not less than 99.0% of KIO₃, calculated on the dried basis.

Description Colourless or white crystals or powder; odourless; taste, slightly astringent. Soluble in water; practically insoluble in ethanol.

Identification (1) Dissolve about 20 mg in 5 ml of water, add 1 drop of saturated sulfur dioxide solution and mix well. Then add several drops of starch IS, a blue colour is produced.

(2) The aqueous solution yields the reactions characteristic of potassium salts (Appendix 3).

Acidity or alkalinity Dissolve 3.0 g in 40 ml of water, add 3 drops of Phenolphthalein IS, no colour is produced. Then add 0.2 ml of sodium hydroxide (0.02 mol/L) VS, a pink colour is produced.

Chlorate To 2.0 g of powder in a small beaker add 2 ml of sulfuric acid, the powder is still white, no colour is produced and no gas is evolved.

Iodide Dissolve 1.0 g in 10 ml of water, add 1 ml of dilute sulfuric acid and 1 drop of starch IS; no blue colour is produced.

Barium Dissolve 1.0 g in 20 ml of water, filter, divide the filtrate into two equal portions. To one portion of the filtrate add 1 ml of dilute sulfuric acid, and another portion add 1 ml of water, allow to stand for 15 minutes. The two solutions are clear similarly.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals To 5.0 g add 40 ml of hydrochloric acid solution (1→2), and evaporate to dryness on a water bath. Treat the residue again as described above with hydrochloric acid solution (1→2) twice of 15 ml each, then heat gently until the residue becomes white, allow to cool. Dissolve it in 20 ml of water, add ammonia TS dropwise until the solution is neutral to phenolphthalein IS, and dilute with water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1). Any colour produced is not more intense than that of a reference solution produced by mixing 2 ml of

than 0.001%.

Arsenic To 5 ml of the test solution obtained in Test for heavy metals, dilute with water to 30 ml. To 20 ml add sufficient water to produce 23 ml, add 5 ml of hydrochloric acid and carry out the limit test for arsenic (Appendix VIII J), it complies with the requirement (0.0003%).

Assay Dissolve about 0.8 g, accurately weighed, in a 250 ml volumetric flask with water, dilute to volume and mix well. Transfer accurately 25 ml to an iodine flask, add 2 g of potassium iodide and 10 ml of dilute hydrochloric acid, insert the stopper, mix well, allow to stand in the dark for 5 minutes. Add 100 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration, add 2 ml of starch IS, continue the titration until the blue colour disappears. Perform a blank determination and make necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 3.567 mg of KIO₃.

Category Iodine replenisher.

Storage Preserve in tightly closed containers.

Preparation (1) Potassium Iodate Granules
(2) Potassium Iodate Tablets

Potassium Iodate Granules

Potassium Iodate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of potassium iodate (KIO₃).

Description White granules.

Identification (1) Triturate the content of 20 containers, add 6 ml of water, shake thoroughly to dissolve potassium iodate, filter, to the filtrate add 5 drops of silver nitrate TS, white precipitate is produced, which is soluble in ammonia TS and insoluble in dilute nitric acid.

(2) Dissolve the content of 1 container, in 10 ml of water, shake thoroughly to dissolve potassium iodate, Measure accurately 2 ml, add 2 ml of 1% potassium iodate solution, 5 ml of 0.2 mol/L sulfuric acid solution and 5.0 ml of starch IS, a blue colour is produced.

(3) Triturate the content of 10 containers, add 3 ml of water, shake thoroughly to dissolve potassium iodate, filter, to the filtrate add 5-10 drops of 0.1% sodium tetraphenylboron solution, white precipitate is produced.

Content uniformity Comply with the requirements for content uniformity except that the limit is ±20% (Appendix X E). Dissolve 1 container in water in a 50 ml volumetric flask and dilute with water to volume, mix well, filter. Measure accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, add 2.0 ml of 1% potassium iodate solution, 5.0 ml of 0.2 mol/L sulfuric acid solution and 5.0 ml of starch IS, dilute with water to volume, mix well, measure the absorbance at 580 nm (Appendix IV B). Dissolve an accurately weighed quantity of potassium iodate CRS previously dried to constant weight at 105°C in water to produce a solution of about 15 µg per ml. Measure accurately 5 ml, repeat the procedure beginning at the words "to a 50 ml volumetric flask...", calculate the content of potassium iodate (KIO₃).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

dissolve an accurately weighed quantity in water to produce a solution of about 15 µg per ml, filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, add 2.0 ml of 1% potassium iodate solution, 5.0 ml of 0.2 mol/L sulfuric acid solution and 5.0 ml of starch IS, dilute with water to volume, mix well, measure the absorbance at 580 nm (Appendix IV B). Repeat the operation, using an accurately weighed quantity of potassium iodate CRS previously dried to constant weight at 105°C instead of potassium iodate granules. Calculate the content of potassium iodate (KIO_3).

Category Iodine replenisher.

Strength 0.15 mg

Storage Preserve in tightly closed containers.

Potassium Iodate Tablets

Potassium Iodate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of potassium iodate (KIO_3).

Description White tablets.

Identification (1) Triturate 10 tablets, add 3 ml of water, shake thoroughly to dissolve potassium iodate and filter, to the filtrate add 1-2 drops of silver Nitrate TS, white precipitate is produced, which is soluble in ammonia TS and insoluble in nitric acid.

(2) Dissolve 1 tablet in 25 ml of water, shake thoroughly to dissolve potassium iodate and filter, Measure accurately 2 ml, add 2 ml of 1% potassium iodate solution, 5 ml of 0.2 mol/L sulfuric acid solution and 5 ml of starch IS, a blue colour is produced.

(3) Triturate 30 tablets, add 10 ml of water, shake thoroughly to dissolve potassium iodate and filter, evaporate the filtrate to dryness on a water bath. Dissolve the residue in 1 ml of water, filter, add 10 drops of sodium tetraphenylenediamine solution, white precipitate is produced.

Content uniformity Comply with the requirements for content uniformity except that the limit is $\pm 20\%$ (Appendix X E). Dissolve 1 powdered tablet in water in a 50 ml volumetric flask and dilute with water to volume, mix well and filter. Measure accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, add 2.0 ml of 1% potassium iodate solution 5.0 ml of 0.2 mol/L sulfuric acid solution and 5.0 ml of starch IS, dilute with water to volume, mix well. Measure the absorbance at 580 nm (Appendix IV B). Dissolve an accurately weighed quantity of potassium iodate CRS previously dried to constant weight at 105°C in water to produce a solution of about 10 µg per ml. Measure accurately 5 ml, repeat the procedure beginning at the words "to a 50 ml volumetric flask..." and calculate the content of KIO_3 .

Other requirement Comply with the general requirements for Tablets (Appendix I A).

Assay Weigh accurately and triturate 20 tablets. Dissolve an accurately weighed quantity in water to produce a solution of about 10 µg per ml, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, add 2.0 ml of 1% potassium iodate solution, 5.0 ml of 0.2 mol/L sulfuric acid solution and 5.0 ml of starch IS, dilute with water to volume, mix well, measure the absorbance at 580 nm (Appendix IV B). Repeat the operation, using an accurately weighed quantity of potassium iodate CRS previously dried to constant weight at 105°C

Category Iodine replenisher.

Strength (1) 0.3 mg (2) 0.4 mg

Storage Preserve in tightly closed containers.

Potassium Iodide

KI 166.00

[7681-11-0]

Potassium Iodide contains not less than 99.0% of KI, calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless; taste, saline and bitter; slightly hygroscopic.

Very soluble in water; soluble in ethanol.

Identification Yields the reactions characteristic of potassium and iodides (Appendix III).

Alkalinity Dissolve 1.0 g in 10 ml of water, add 0.10 ml of sulfuric acid (0.05 mol/L) VS and 1 drop of phenolphthalein IS, no red colour is produced.

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and not more intense coloured than reference solution Y_1 (Appendix IX A, method 1).

Chlorides Dissolve 0.25 g in 100 ml of water, add 1 ml of concentrated hydrogen peroxide solution and 1 ml of phosphoric acid, boil until the solution becomes colourless and cool. Add again 0.5 ml of concentrated hydrogen peroxide solution, boil and then cool. Transfer it to a 250 ml volumetric flask, dilute with water to volume and mix well. Carry out the limit test for chlorides (Appendix VIII A), using 5.0 ml of the solution. Any opalescence produced is not more intense than that of a reference, using 2.5 ml of standard sodium chloride solution (0.50%).

Sulfates Carry out the limit test for sulfates (Appendix VII B), using 0.50 g of the substance being examined. Any opalescence produced is not more intense than that of a reference using 2.0 ml of standard potassium sulfate solution (0.04%).

Iodate Dissolve 0.50 g in 10 ml of freshly boiled and cooled water, add 2 drops of dilute sulfuric acid and 0.2 ml of starch IS, allow to stand in dark, no blue colour is produced within 2 minutes.

Loss on drying When dried at 105°C for 4 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Barium Dissolve 1.0 g in 20 ml of water, filter, divide the filtrate into two equal portions. Add 1 ml of dilute sulfuric acid to one portion and add 1 ml of water to the other portion. The two portions should be same clear within 15 minutes.

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of water, add 35 ml of hydrochloric acid. Titrate with potassium iodate (0.05 mol/L) VS until a yellow colour is produced; add 5 ml of chloroform, continue the titration and shake thoroughly until the colour disappears in the chloroform layer. Each ml of potassium iodate (0.05 mol/L) VS is equivalent to 16.60 mg of KI.

Category Iodine replenisher.

from light.

Preparation Potassium Iodide Tablets

Potassium Iodide Tablets

Potassium Iodide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Potassium Iodide (KI).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets with water and filter. The filtrate yields the reactions characteristic of potassium salts and iodides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Weigh accurately a quantity equivalent to about 0.3 g of potassium iodide, carry out the Assay as described under Potassium Iodide, beginning at the words "dissolve in 10 ml of water...".

Category As described under Potassium Iodide.

Strength (1) 10 mg (2) 200 mg

Storage Preserve in tightly closed containers, and protected from light and stored in dry place.

Potassium Permanganate

KMnO₄ 158.03 [7722-64-7]

Potassium Permanganate contains not less than 99.3% of KMnO₄.

Description A dark purple slender prismatic crystal or granule with bluish metallic lustre; odourless; may explode on contact with certain organic or easily oxidizable substances. Freely soluble in boiling water; soluble in water.

Identification (1) Acidify 5 ml of an aqueous solution (1→1000) with dilute sulfuric acid, add dropwise hydrogen peroxide solution, the purple-red colour is discharged. (2) The above discoloured solution yields the reactions characteristic of potassium salts (Appendix III).
